NAS 1.21:

ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges:

IAA (A-10000 Series)	A81-40833 – A81-49982
STAR (N-10000 Series)	N81-28047 – N81-34139

This bibliography was prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by PRC Government Information Systems.

NASA SP-7041 (32)

EARTH RESOURCES

A Continuing Bibliography
With Indexes
Issue 32

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced between October 1 and December 31, 1981 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

Scientific and Technical Information Branch 1982

Washington, DC

READEX FICHE best copy available

This supplement is available as NTISUB/038/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $10.50 domestic; $21.50 foreign for standing orders. Please note: Standing orders are subscriptions which do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

INTRODUCTION

The technical literature described in this continuing bibliography may be helpful to researchers in numerous disciplines such as agriculture and forestry, geography and cartography, geology and mining, oceanography and fishing, environmental control, and many others. Until recently it was impossible for anyone to examine more than a minute fraction of the earth's surface continuously. Now vast areas can be observed synoptically, and changes noted in both the earth's lands and waters, by sensing instrumention on orbiting spacecraft or on aircraft.

This literature survey lists 580 reports, articles, and other documents announced between October 1 and December 31, 1981 in *Scientific and Technical Aerospace Reports (STAR)*, and *International Aerospace Abstracts (IAA)*.

The coverage includes documents related to the identification and evaluation by means of sensors in spacecraft and aircraft of vegetation, minerals, and other natural resources, and the techniques and potentialities of surveying and keeping up-to-date inventories of such riches. It encompasses studies of such natural phenomena as earthquakes, volcanoes, ocean currents, and magnetic fields; and such cultural phenomena as cities, transportation networks, and irrigation systems. Descriptions of the components and use of remote sensing and geophysical instrumentation, their subsystems, observational procedures, signature and analyses and interpretive techniques for gathering data are also included. All reports generated under NASA's Earth Resources Survey Program for the time period covered in this bibliography will also be included. The bibliography does not contain citations to documents dealing mainly with satellites or satellite equipment used in navigation or communication systems, nor with instrumentation not used aboard aerospace vehicles.

The selected items are grouped in nine categories. These are listed in the Table of Contents with notes regarding the scope of each category. These categories were especially chosen for this publication, and differ from those found in *STAR* and *IAA*.

Each entry consists of a standard bibliographic citation accompanied by an abstract. The citations and abstracts are reproduced exactly as they appeared originally in *STAR*, or *IAA*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the variation in citation appearance.

Under each of the nine categories, the entries are presented in one of two groups that appear in the following order:

IAA entries identified by accession number series A81-10,000 in ascending accession number order;

STAR entries identified by accession number series N81-10,000 in ascending accession number order.

After the abstract section, there are five indexes:

subject, personal author, corporate source, contract number and report/accession number.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A81-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $7.00 per document up to a maximum of 40 pages. The charge for each additional page is $0.25. Microfiche[1] of documents announced in *IAA* are available at the rate of $3.00 per microfiche on demand, and at the rate of $1.25 per microfiche for standing orders for all *IAA* microfiche. The price for the *IAA* microfiche by category is available at the rate of $1.50 per microfiche plus a $1.00 service charge per category per issue. Microfiche of all the current AIAA Meeting Papers are available on a standing order basis at the rate of $1.50 per microfiche.

Minimum air-mail postage to foreign countries is $1.00 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N81-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code followed by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail:- BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

TABLE OF CONTENTS

Subject Categories

Abstracts in this Bibliography are grouped under the following categories: *page:*

01 AGRICULTURE AND FORESTRY 197
Includes crop forecasts, crop signature analysis, soil identification, disease detection, harvest estimates, range resources, timber inventory, forest fire detection, and wildlife migration patterns.

02 ENVIRONMENTAL CHANGES AND CULTURAL RESOURCES 213
Includes land use analysis, urban and metropolitan studies, environmental impact, air and water pollution, geographic information systems, and geographic analysis.

03 GEODESY AND CARTOGRAPHY 221
Includes mapping and topography.

04 GEOLOGY AND MINERAL RESOURCES 225
Includes mineral deposits, petroleum deposits, spectral properties of rocks, geological exploration, and lithology.

05 OCEANOGRAPHY AND MARINE RESOURCES 231
Includes sea-surface temperature, ocean bottom surveying imagery, drift rates, sea ice and icebergs, sea state, fish location.

06 HYDROLOGY AND WATER MANAGEMENT 243
Includes snow cover and water runoff in rivers and glaciers, saline intrusion, drainage analysis, geomorphology of river basins, land uses, and estuarine studies.

07 DATA PROCESSING AND DISTRIBUTION SYSTEMS 257
Includes film processing, computer technology, satellite and aircraft hardware, and imagery.

08 INSTRUMENTATION AND SENSORS 269
Includes data acquisition and camera systems and remote sensors.

09 GENERAL 277
Includes economic analysis.

CANADIAN CROP CALENDARS IN SUPPORT OF THE EARLY WARNING PROJECT

M. H. Trenchard and T. Hodges, Principal Investigators Aug. 1980 151 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of Interior, and Agency for International Development ERTS

(Contract NAS9-15800; Proj. AgRISTARS)

(E81-10001; NASA-CR-163558; SR-LO-00475; LEMSCO-14676; JSC-16376) Avail: NTIS HC A08/MF A01 CSCL 02C

The Canadian crop calendars for LACIE are presented. Long term monthly averages of daily maximum and daily minimum temperatures for subregions of provinces were used to simulate normal daily maximum and minimum temperatures. The Robertson (1968) spring wheat and Williams (1974) spring barley phenology models were run using the simulated daily temperatures and daylengths for appropriate latitudes. Simulated daily temperatures and phenology model outputs for spring wheat and spring barley are given.

A81-13376 * # **Experiments in infrared multispectral mapping of earth resources.** J. B. Wellman and A. F. H. Goetz (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.). In: Sensor Systems for the 80's Conference, Colorado Springs, Colo., December 2-4, 1980, Technical Papers New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 163-174. 12 refs. Contract No. NAS7-100. (AIAA 80-1930)

Two evolutionary infrared remote sensing experiments provide the basis for the development of an operational mapping capability for geology exploration. A 10-band radiometer scheduled for an early Shuttle flight has completed an aircraft flight program which demonstrated the utility of a number of narrow spectral channels. A multispectral mapper utilizing an infrared area array detector to acquire simultaneous images in multiple wavelengths is being assembled. A design concept for an operational sensor which employs area arrays for registered multispectral image data acquisition is under study. The sensor would utilize onboard spectral band selection, radiometric correction, and data compression to satisfy the demanding requirements of the user community. (Author)

A Continuing Bibliography (Issue 32)

JANUARY 1982

01

AGRICULTURE AND FORESTRY

Include crop forecasts, crop signature analysis, soil identification, disease detection, harvest estimates, range resources, timber inventory, forest fire detection, and wildlife migration patterns.

A81-41485 # **Results of ground surveys, carried out in conjunction with satellite and aerial studies, of the state of winter wheat on the Kursk test polygon (Rezul'taty nazemnykh podsputnikovykh i podsamoletnykh issledovanii sostoianiia ozimoi pshenitsy na testovom uchastke Kurskogo poligona).** N. V. Beliaeva and T. M. Vasiukhina. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 51-63. 12 refs. In Russian.

A81-41486 # **Determination of the types and state of crops from multispectral aerial photographs (Opredelenie vidov i sostoianiia sel'skokhoziaistvennykh kul'tur po materialam mnogozonal'noi aerofotos'emki).** T. M. Vasiukhina and N. K. Vinnichenko. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 64-72. 5 refs. In Russian.

A81-41487 # **Evaluation of the possibility of using spectral-band and multispectral aerial photographs for the large-scale survey of natural pastures (Otsenka vozmozhnosti ispol'zovaniia spektrozonal'nykh i mnogozonal'nykh aerofotosnimkov dlia krupnomasshtabnogo obsledovaniia prirodnykh kormovykh ugodii).** N. V. Beliaeva, V. B. Golub, and E. V. Tsvetaeva. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 73-79. 7 refs. In Russian.

A81-41488 # **The possibilities of the automated classification of agricultural objects on the basis of their multispectral aerial-spaceborne images (Vozmozhnosti avtomatizirovannoi klassifikatsii sel'skokhoziaistvennykh ob'ektov po ikh mnogozonal'nym aerokosmicheskim izobrazheniiam).** G. G. Andreev. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 80-85. 5 refs. In Russian.

The paper examines software aspects of the automated processing of aerial and spaceborne images of agricultural regions; the purpose of the processing is to classify agricultural objects on the basis of their photometric features and to identify these objects with crops. Particular attention is given to a method that involves the use of a chain of recognition algorithms. Applications of this method are considered. B.J.

A81-41489 # **Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects (Prakticheskoe primenenie metoda pustykh blokov dlia vydeleniia granits sel'skokhoziaistvennykh ob'ektov s pomoshch'iu EVM).** G. G. Andreev and L. N. Choban. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 86-92. In Russian.

An important problem in the machine analysis of multispectral images of agricultural objects is the determination of the boundaries of these objects. The criterion of empty blocks (a method for verifying nonparametric statistical hypotheses) is proposed as a method for determining these boundaries. Algorithms of the main program and the learning program are presented along with examples of computation on the EC-1022 computer. B.J.

A81-43181 **Agricultures's needs related to satellite hydrology.** E. T. Engman (U.S. Department of Agriculture, Hydrology Laboratory, Beltsville, MD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 19-25. 10 refs.

A81-43221 * **Survey of in-situ and remote sensing methods for soil moisture determination.** T. J. Schmugge (NASA, Goddard Space Flight Center, Laboratory for Atmospheric Sciences, Greenbelt, MD), T. J. Jackson (U.S. Department of Agriculture, Hydrology Laboratory, Beltsville, MD), and H. L. McKim (U.S. Army, Cold Regions Research Engineering Laboratory, Hanover, NH). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 333-352. 152 refs.

General methods for determining the moisture content in the surface layers of the soil based on in situ or point measurements, soil water models and remote sensing observations are surveyed. In situ methods described include gravimetric techniques, nuclear techniques based on neutron scattering or gamma-ray attenuation, electromagnetic techniques, tensiometric techniques and hygrometric techniques. Soil water models based on column mass balance treat soil moisture contents as a result of meteorological inputs (precipitation, runoff, subsurface flow) and demands (evaporation, transpiration, percolation). The remote sensing approaches are based on measurements of the diurnal range of surface temperature and the crop canopy temperature in the thermal infrared, measurements of the radar backscattering coefficient in the microwave region, and measurements of microwave emission or brightness temperature. Advantages and disadvantages of the various methods are pointed out, and it is concluded that a successful monitoring system must incorporate all of the approaches considered. A.L.W.

A81-43224 * **Soil moisture applications of the heat capacity mapping mission.** J. L. Heilman (Texas A&M University, College Station, TX) and D. G. Moore (South Dakota State University, Brookings, SD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 371-376. 5 refs. Contract No. NAS5-2406.

Results are presented of ground, aircraft and satellite investigations conducted to evaluate the potential of the Heat Capacity Mapping Mission (HCMM) to monitor soil moisture and the depth of shallow ground water. The investigations were carried out over eastern South Dakota to evaluate the relation between directly measured soil temperatures and water content at various stages of canopy development, aircraft thermal scanner measurements of apparent canopy temperature and the reliability of actual HCMM data. The results demonstrate the possibility of evaluating soil moisture on the basis of HCMM apparent canopy temperature and day-night soil temperature difference measurements. Limitations on the use of thermal data posed by environmental factors which influence energy balance interactions, including phase transformations, wind patterns, topographic variations and atmospheric constituents are pointed out. A.L.W.

A81-43262 **A multistage mapping approach for an irrigated croplands inventory.** L. Tinney, J. Holloway, J. Baggett, and J. Estes (California, University, Santa Barbara, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 694-696.

A81-43264 **Selected irrigation acreage estimates in northern Florida from Landsat data.** K. B. Webster, R. J. Musgrove (Suwannee River Water Management District, White Springs, FL), J. R. Lucas (Technicolor Graphic Services, Inc.; U.S. Geological Survey, EROS Data Center, Sioux Falls, SD), and A. L. Higer (U.S. Geological Survey, Miami, FL). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 701-705. Research supported by the U.S. Geological Survey.

A81-43265 * **Mapping irrigated lands in Western Kansas from Landsat.** T. H. L. Williams and J. Poracsky (Kansas, University, Lawrence, KS). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 707-714. 19 refs. Grant No. NGL-17-004-024.

A description is presented of a multidate visual interpretation technique for identifying and mapping irrigated lands in Western Kansas based on gray tone interpretation of Landsat imagery. The technique provides detailed maps of irrigated lands that can be updated yearly (from 1972 onwards) and used as the basis for calculations of water use and its temporal trends. A review of remote sensing work on irrigated lands indicates that three different types of study have evolved, involving various combinations of desired final data and the means of arriving at it. Attention is given to crop characteristics, the development of an interpretation technique, the interpretation procedure, the computer assisted output, and aspects of verification and accuracy. It is pointed out that the considered technique is likely to be applicable to similar situations of a semi-arid area dominated by a small number of crops. G.R.

A81-43266 **Mapping irrigated cropland on the High Plains using Landsat.** G. P. Thelin, T. L. Johnson, and R. A. Johnson (U.S. Geological Survey, Reston, VA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 715-721.

A program has been recently undertaken to determine water use in the High Plains. The High Plains aquifer, the focus of the study, covers approximately 450,000 square kilometers. The study, called the High Plains Regional Aquifer-System Analysis is developing a computer model designed to simulate the ground water system throughout the High Plains aquifer. Three difference methods for mapping irrigated cropland were evaluated. The first method employed visual interpretation of classified source materials. The second method employs interpretation of Landsat multispectral images, and the third the digital analysis of Landsat data. It was found that digital analysis of Landsat multispectral data provides an efficient method of mapping irrigated cropland. After evaluating the three different methods for mapping the areal extent of irrigated cropland, plans are being made to complete the task of mapping for the entire extent of the High Plains Regional aquifer. G.R.

A81-43536 **Rainforest species on large-scale color photos.** B. J. Myers and M. L. Benson (Commonwealth Scientific and Industrial Research Organization, Div. of Forest Research, Canberra, Australia). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Apr. 1981, p. 505-513. 16 refs.

The extreme variability and complexity of tropical rainforests preclude any detailed floristic classification from conventional small-scale black-and-white aerial photographs. This paper describes a study conducted in north Queensland of the use of large-scale color, color infrared, and black-and-white aerial photographs for the identification of tree species as a basis for rainforest classification. Normal color transparency film at 1:2000 scale was the best combination of film and scale for species identification. Six forest areas studied by five interpreters had a total of 111 different dominant and codominant species. In the test stands, 55 different rainforest species were correctly identified at least once. Twenty-four species were identified with more than 75 percent accuracy and 11 of these were correctly identified in every case examined by the five interpreters. Directions for future research are suggested. (Author)

A81-43537 **Extravisual damage detection - Defining the standard normal tree.** P. A. Murtha and J. A. McLean (British Columbia, University, Vancouver, Canada). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Apr. 1981, p. 515-522. 9 refs. Research supported by the Natural Sciences and Engineering Research Council of Canada.

Large-scale color-infrared aerial photographs of an interior British Columbia Douglas-fir stand are examined by optical visual analysis techniques for evidence of tree damage. Red-, green-, and blue-filter optical densitometric measurements were taken from developed film dye-layers, and the red:green-, red:blue-, and green:blue-filter density ratios were calculated. Damages were classified according to type, and the trees were field-checked for accuracy of species designation, height, age, and other pathological conditions. Results of a diameter increment analysis indicated that diameter increments were related to damage classification, with damage type III Ob having a reduced radial increment of less than 0.05. Damage types III Oa and III Ob had darker or lighter magenta hues than neighboring normal trees, although they could not be separated visually by crown characteristics. Selective logging makes desirable the removal of slow growing trees, and this technique makes possible the thinning of damage type III Ob and III Ob/II E trees for selective logging programs. D.L.G.

A81-43540 * **Vegetable crop management with remote sensing.** C. H. Blazquez (NASA, Kennedy Space Center, Cocoa Beach, FL), R. A. Elliott (Systems Control, Inc. /VT/, Champlain Technology Industries, West Palm Beach, FL), and G. J. Edwards (Florida, University, Lake Alfred, FL). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Apr. 1981, p. 543-547. 12 refs.

Repetitive aerial photography with color infrared (ACIR) and black-and-white infrared (B and WIR) films was taken of potato and tomato fields in southwest Florida during the spring season of 1975. Color differences observed in the photographs revealed different levels of soil moisture in the fields, improper ditch arrangements, poor stands of plants, and areas where late blight (Phytophthora infestans) (Mont.)d.By and early blight (Alternaria solani) (Ell. and Mart.) Jones and Grout. were defoliating potato plants. Photographs of fields before planting also indicated areas where excessive rock formations existed which would make field preparation costly. Preplanting photographs also pinpointed areas with different water table levels. (Author)

A81-43727 **Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers.** Meeting sponsored by the American Society of Photogrammetry and American Congress on Surveying and Mapping. Falls Church VA, American Society of Photogrammetry, 1981. 358 p.

Topics discussed include new uses of photogrammetric techniques, current digital processing for interfacing cartography, and photogrammetry and land remote sensing and data acquisition. Particular consideration is given to remote sensing plant science applications, such as the use of remote sensing data in predicting vegetative variables, detecting crop stress, and interpreting landscape patterns. Imaging radar used in geology, hydrospherics, and environmental impact assessment are also discussed. J.F.

A81-43732 **Mountain pine beetle damage surveys with high-altitude panoramic photography.** B. B. Eav, R. D. Dillman, J. C. Prill, and R. E. Hinkle (Lockheed Engineering and Management Services Co., Inc., Houston, TX). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. DA-1-D-1 to DA-1-D-14. 10 refs. U.S. Department of Agriculture Contract No. 53-3187-8-25.

An investigation of the potential of high altitude panoramic photography obtained with Itek KA-80A optical bar camera, compared with conventional surveys, for improving the efficiency of statewide mountain pine beetle (Dendroctonus ponderosa Hopkins) damage assessment involved the development of an appropriate survey design. The survey design initially developed for a small scale test using data from the Black Hills National Forest in South Dakota was a two-stage sampling with probability proportional to size in each stage. This design was refined and modified to include a third stage for application on a large scale in the Colorado Front Range comprising 5.5 million acres. Results indicate that optical bar surveys are a realistic alternative to conventional survey techniques and potentially more cost effective. (Author)

A81-43737 **The effect of sensor bandpass and spectral response in crop stress detection.** M. J. Duggin (New York, State University, Syracuse, NY) and P. N. Slater (Arizona, University, Tucson, AZ). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-2-C-1 to RS-2-C-12. 8 refs. Research supported by the U.S. Department of Agriculture and New York State Department of Environmental Conservation.

In order to map and to quantify vegetative disease using remote sensing it is necessary to be able to analyze the data to discern contrasts between healthy and diseased vegetative canopies, or between canopies affected by disease to different levels of severity. In order to perform such quantitative analysis, it is necessary to consider the interaction between the spectral reflectance of the target and the spectral response of the remote sensing device. While such interaction will be small for spectrally flat targets (e.g. white sand), they have been found to be larger for vegetation. Calculations are made to compare the contrasts obtained by using the outputs of each channel within each band of the Landsat multispectral scanners (MSS's) when looking at identical pairs of vegetative targets. Similar calculations are performed for Kodak color-infrared film (EK 2448) and for Kodak black-and-white infrared film (EK 2424). (Author)

A81-43738 * **Waveband evaluation of proposed thematic mapper in forest cover classification.** R. S. Latty and R. M. Hoffer (Purdue University, West Lafayette, IN). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-2-D-1 to RS-2-D-12. 31 refs. Contract No. NAS9-15889.

This study involved the evaluation of the characteristics of multispectral scanner data relative to forest cover type mapping, using NASA's NS-001 multispectral scanner to simulate the proposed Thematic Mapper (TM). The objectives were to determine: (1) the optimum number of wavebands to utilize in computer classifications of TM data; (2) which channel combinations provide the highest expected classification accuracy; and (3) the relative merit of each channel in the context of the cover classes examined. Transformed divergence was used as a measure of statistical distance between spectral class densities associated with each of twelve cover classes. The maximum overall mean pair-wise transformed divergence was used as the basis for evaluating all possible waveband combinations available for use in computer-assisted forest cover classifications. (Author)

A81-43740 * **Remote sensing aided procedure for conifer growth modeling in the northeastern Sierra Nevada.** H. G. Smith and S. Khorram (California, University, Berkeley, CA). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-2-F-1 to RS-2-F-13. 10 refs. Grant No. NGL-05-003-404.

The objective of this study was to use remotely-sensed data with ground-acquired data for preparing inputs to a mathematical model for generation of a potential conifer growth map of a wildland area. The study area, jointly selected by the resource managers of the U.S. Forest Service at the Plumas National Forest and researchers, covers approximately 500 sq km in the northeastern scrapment of Sierra Nevada. The approach involved a computerized databank based on both remotely-sensed and ground-acquired data. The remotely-sensed data included Landsat Multispectral Scanner (MSS) data, NOAA-5 Very High Resolution Radiometer (VHRR) data and U-2 Color infrared photography. The ground data included U.S. Geological Survey (USGS) topographic maps, Defense Mapping Agency (DMA)/USGS digital terrain data, soil maps, and vegetation data. The results included a series of maps for the final product as well as the intermediate products. The intermediate products were potential evapotranspiration, aspect, and soil plant available water. (Author)

A81-43741 * **Look direction dependence of radar backscattering cross section for agricultural fields.** W. P. Waite, H. C. MacDonald, J. S. Demarcke, and B. H. Corbell (Arkansas, University, Fayetteville, AR). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-2-G-1 to RS-2-G-14. 9 refs. Contracts No. NAS9-14251; No. JPL-954940.

Analysis of multifrequency-multipolarization scatterometer data acquired by NASA Johnson Space Center during the 1978 Colby Agricultural Soil Moisture Experiment provides evidence that the effects of row orientation remain quite severe for relatively bare fields over a wide range of radar frequencies. In addition, Seasat satellite radar imagery from areas in Louisiana shows dominant row orientation effects even beneath substantial amounts of vegetation cover. The multiparameter nature of the Colby data set, and the continuous angular change in field patterns observed in the Louisiana test area provide much finer definition of microwave sensitivity to row orientation than has been possible in the past. (Author)

A81-43743 * **Use of Seasat satellite radar imagery for the detection of standing water beneath forest vegetation.** H. C. MacDonald, W. P. Waite, and J. S. Demarcke (Arkansas, University, Fayetteville, AR). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-3-B-1 to RS-3-B-13. 13 refs. Contract No. JPL-954940.

The Seasat synthetic aperture radar, operating at a 23-cm, L-band wavelength, detected anomalous tonal patterns in areas having relatively uniform vegetable canopy. These anomalously high radar returns were shown to be related more to the underlying terrain (areas of standing water) than to the vegetation canopy. These results show that L-band radars, imaging forested terrain in a Seasat configuration, are sensitive to gross changes in vegetation, and may even penetrate the vegetation canopy, providing an unmistakable radar signature. Properly designed space imaging radar shuttle experiments, using multiple frequency and polarization radars of various depression angles, may provide documentation for a flood-monitoring capability. Height, configuration, and density of the biomass in conjunction with frequency and incidence angle of the imaging system are shown to be important factors in formulating a backscatter model, but the relative significance of each is yet to be determined. J.F.

A81-43744 * **Active microwave measurements for estimating soil moisture in Oklahoma.** T. J. Jackson (U.S. Department of Agriculture, Hydrology Laboratory, Beltsville, MD), A. Chang, and T. J. Schmugge (NASA, Goddard Space Flight Center, Greenbelt, MD). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-3-C-1 to RS-3-C-10. 8 refs.

Previous research has shown that active and passive microwave sensors can be used to estimate near surface soil moisture. An advantage of the active systems is that they have the capability of high spatial resolution from satellite platforms. Most of the previous research has been conducted on agricultural fields. This study examined the use of active microwave data for estimating the average surface soil moisture for several watersheds located near Chicasha, Oklahoma. Data were collected using P, L, and C band scatterometers, mounted on the National Aeronautics and Space Administration C130B aircraft flying at an altitude of 300 m. Soil moisture data were collected in conjunction with three flights during May 1978. Our results indicated that relationships between the scatterometer data and soil moisture do exist and agree with the results obtained at the University of Kansas. (Author)

A81-44637 **Crop reporting from space - Problems, promises, potential.** D. Paarlberg. In: Commercial operations in space - 1980-2000; Proceedings of the Eighteenth Goddard Memorial Symposium, Washington, DC, March 27, 28, 1980. San Diego, CA, American Astronautical Society; Univelt, Inc., 1981, p. 111-115. (AAS 80-062)

Crop reporting from space is in a transitional stage, gradually becoming operational. Research, experimentation and development continue. A three-year experimental program marginally met its target for accuracy with regard to wheat production in the USSR, 90 percent accurate 90 percent of the time. Remote sensing is being used by the Department of Agriculture to improve the accuracy of its crop reports in the United States. It has not been possible to estimate costs and benefits with acceptable accuracy. The best method of releasing remote-sensed crop report data seems to be wide simultaneous distribution to the general public, free of direct cost. (Author)

A81-45428 **A photo interpretation approach to forest regrowth monitoring using side-looking airborne radar - Grant County, Oregon.** N. E. Hardy (Toronto, University, Mississauga, Ontario, Canada). *International Journal of Remote Sensing*, vol. 2, Apr.-June 1981, p. 135-144. 11 refs.

A preliminary project was devised to study the forest monitoring potential of side-looking airborne radar. A group of ten photo interpreters was assembled to evaluate the forest regrowth content of a radar image. A series of 20 cutting locations was selected from U.S. Forest Service data. Categories and category associations were tabulated from each participant's results. Some success was achieved in distinguishing between five major forest categories. Little success was achieved in attempting to subdivide the image content into highly specific categories. It was concluded that the radar has the potential to segregate categories, but interpreters must possess as much radar interpretation expertise as forestry expertise. (Author)

A81-45432 * **Infrared-temperature variability in a large agricultural field.** J. P. Millard (NASA, Ames Research Center, Moffett Field, CA), R. C. Goettelman (EAL Corp., Richmond, CA), and M. J. LeRoy (DCA Corp., Palo Alto, CA). *International Journal of Remote Sensing*, vol. 2, July-Sept. 1981, p. 201-211.

Dunnigan Agro-Meteorological Experiment airborne thermal scanner images of a large varying-terrain barley field are acquired and analyzed. Temperature variability that may occur within instantaneous fields of view (IFOV) is defined (coefficient of variation: standard deviation/mean temperature in degrees C), and the percentage of the area within various IFOV's within + or - 1, 2, 3, and 5 degrees of the mean is determined. With the exception of very rugged terrain, over 80% of the area within 4, 16, 65 and 258 ha cells was at temperatures within + or - 3 C of the mean cell temperature. Remote measurements of field temperature appeared to be slightly influenced by pixel size in the range 4 ha to 259 ha, and the area percentage within any pixel which contributes within + or - 1, 2, 3, and 5 degrees C of the mean, is nominally the same. In conclusion, no great advantage is found in utilizing a small IFOV instead of a large one for remote sensing of crop temperature. D.L.G.

A81-46026 **Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, Purdue University, West Lafayette, IN, June 3-6, 1980.** Symposium sponsored by the International Society of Soil Science, American Society of Agronomy, IEEE, et al. Edited by P. G. Burroff and D. B. Morrison. New York, Institute of Electrical and Electronics Engineers, Inc., 1980. 397 p. Members, $22.50; nonmembers, $30.

Papers included in this volume cover the general areas of data processing and analysis, data processing systems, crop inventory, forestry, land use, soil survey, and soil information. The following topics are discussed: the current and future need for land resource information, future earth resource data acquisition systems, current soil information systems, remote sensing and soil survey, and the future requirements of resource data storage, retrieval, analysis, and utilization. Plans for the U.S. operational land satellite program, soil information needs, nonfederal information requirements, and research priorities for the 1980's are outlined. V.L.

A81-46031 **Application of multispectral reflectance studies of soils - Pre-Landsat.** S. J. Kristof, M. F. Baumgardner, R. A. Weismiller, and S. Davis (Purdue University, West Lafayette, IN). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 52-62. 12 refs.

Results of preliminary studies on the reflectance properties of soils as related to their other physical and chemical properties are presented. Laboratory studies of the spectral properties of 250 soil samples representing 22 soil series, ten textures, and four drainage profiles were carried out to determine the visible and infrared spectral bands most suitable for observing soil variations. The application of the digital analysis of multispectral data to soil mapping was then studied on the basis of double-beam spectrophotometer and airborne multispectral scanner data taken of ten areas characterized by vegetation, bare soil and water features. Analysis of the field data confirmed the relationships found between soil reflectance and color, organic matter content, moisture content and texture, and indicated the usefulness of multispectral mapping in soil surveys. A.L.W.

A81-46032 * **An assessment of Landsat data acquisition history on identification and area estimation of corn and soybeans.** M. M. Hixson, M. E. Bauer (Purdue University, West Lafayette, IN), and D. K. Scholz (U.S. Geological Survey, EROS Data Center, Sioux Falls, SD). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 72-77. 9 refs. Contract No. NAS9-15466.

During the past decade, numerous studies have demonstrated the potential of satellite remote sensing for providing accurate and timely crop area information. This study assessed the impact of Landsat data acquisition history on classification and area estimation accuracy of corn and soybeans. Multitemporally registered Landsat MSS data from four acquisitions during the 1978 growing season were used in classification of eight sample segments in the U.S. Corn Belt. The results illustrate the importance of selecting Landsat acquisitions based on spectral differences in crops at certain growth stages. (Author)

A81-46033 * **Crop classification with a Landsat/radar sensor combination.** R. Y. Li, F. T. Ulaby (University of Kansas Center for Research, Inc., Lawrence, KS), and J. R. Eyton (South Carolina, University, Columbia, SC). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 78-87. 9 refs. Contract No. NAS9-15421.

A combined Landsat/radar approach to classification of remotely sensed data, with emphasis on crops, was undertaken. Radar data were obtained by microwave radar spectrometers over fields near Eudora, Kansas and Landsat image data were obtained for the same test site. After Landsat digital images were registered and test-cells extracted, a comparable set of radar image pixels were simulated to match the Landsat pixels. The combined data set is then used for classification, and the results are examined with the best combination of sensor variables identified. Finally, the usefulness of radar in a simulated cloud-cover situation is demonstrated. The major conclusion derived from this study is that the combination of radar/optical sensors is superior to either one alone. (Author)

A81-46034 # **Comparison of Landsat-2 and field spectrometer reflectance signatures of south Texas rangeland plant communities.** A. J. Richardson, D. E. Escobar, H. W. Gausman, and J. H. Everitt (U.S. Science and Education Administration, Weslaco, TX). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 88-97. 27 refs.

A81-46035 * **A model of plant canopy polarization response.** V. C. Vanderbilt (Purdue University, West Lafayette, IN). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 98-108. 30 refs. Contract No. NAS9-15466.

Sensors to remotely measure the linear polarization of ground scenes have been proposed for the Multispectral Resource Sampler (MRS), a satellite sensor system proposed to complement the Thematic Mapper. At present justification for a sensor on MRS to measure scene polarization is limited. This paper discusses a model for the amount of linearly polarized light reflected by the shiny leaves of such crops as wheat, corn, and sorghum. The theory demonstrates that, potentially, measurements of the linearly polarized light from a crop canopy may be used as an additional feature to discriminate between crops. Examination of the model suggests that, potentially, satellite polarization measurements may be used to monitor crop development stage, leaf water content, leaf area index, hail damage, and certain plant diseases. The model adds to the understanding of the potential information content of scene polarization measurements acquired by future satellite sensor systems such as MRS. (Author)

A81-46036 * **Procedure M - A framework for stratified area estimation.** R. J. Kauth, R. C. Cicone, and W. A. Malila (Michigan, Environmental Research Institute, Ann Arbor, MI). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 109-119. 20 refs. Contract No. NAS9-15476.

This paper describes Procedure M, a systematic approach to processing multispectral scanner data for classification and acreage estimation. A general discussion of the rationale and development of the procedure is given in the context of large-area agricultural applications. Specific examples are given in the form of test results on acreage estimation of spring small grains. (Author)

A81-46047 **Use of Landsat digital data to assist in mapping soils on Arizona rangelands.** E. H. Horvath, D. F. Post (Arizona, University, Tucson, AZ), W. M. Lucas (Santa Fe National Forest, Santa Fe, NM), and R. A. Weismiller (Purdue University, West Lafayette, IN). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 235-240. 17 refs. Research supported by the U.S. Bureau of Land Management and Coronado National Forest.

The outline and results of more than three years of field and laboratory studies are presented. Spectral maps generated from Landsat satellite data were used to aid in soil and vegetation surveys of five sites in southeastern Arizona. The sites are rangeland with varied physiography and relief, but generally sparse vegetation. It was found that spectral maps show a very positive correlation with grey tones or color patterns on photographs, and can be an excellent auxiliary tool for locating boundaries of mapping units. They can also aid in the location of representative sites for pedon descriptions, and could be used as an aid to quality control and map correlation studies in the field. The type and/or color of the geologic parent material was the dominant factor affecting the response recorded by the satellite. (Author)

A81-46050 **A case study of soil erosion detection by digital analysis of the remotely sensed multispectral Landsat scanner data of a semi-arid land in southern India.** V. Guruswamy, S. J. Kristof, and M. Baumgardner (Purdue University, West Lafayette, IN). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 266-272. 9 refs.

A81-46051 * **Development of a digital data base for reflectance-related soil information.** E. R. Stoner (NASA, Earth Resources Laboratory, Bay St. Louis, MS) and L. L. Biehl (Purdue University, West Lafayette, IN). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 273-279. 5 refs. Contract No. NAS9-15466.

A digital soils data base established for inclusion of soil reflectance data, physical, chemical, and engineering measurements, and site information is discussed. Initial data are taken from 500 soil samples covering the spectral range of 0.5 to 2.3 microns. Information obtained from each observation includes spectral data, and identification records with the soil and spectral observation parameters. The LARSPEC software system is available to retrieve and manipulate information, and scattergrams of identification and spectral data allow the initiation of statistical analyses of soil data. In addition, soil characteristics, graphical displays of reflectance spectra, and identification information examples are given. D.L.G.

A81-46054 * # **Bulk processing techniques for very large areas - Landsat classification of California.** W. Newland (Technicolor Graphic Services, Inc., Moffett Field, CA), D. Peterson, and S. Norman (NASA, Ames Research Center, Moffett Field, CA). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 306-318. 6 refs.

In 1977, California Law AB452 was passed to provide a mandate for the California Department of Forestry (CDF) to design and implement an information system to assess the forest land base for multiple uses and values. In connection with this mandate, a land-cover map of the entire state, emphasizing forest types, was produced. In producing this map, the latest techniques in digital image mosaicking were combined with the highspeed processing capability available on the ILLIAC IV parallel processor and other computer systems at the Ames Research Center (ARC). An operational and very responsive analysis method was developed at ARC that permitted on-time response to weekly workshops conducted with CDF field personnel to identify all 1,200 spectral classes and to produce final products. Over 100,000,000 acres were classified in the period between December 1, 1978, and April 15, 1979. All analyses were conducted using existing software. G.R.

A81-46055 * # **Procedure 1 and forestland classification using Landsat data.** R. F. Nelson (NASA, Goddard Space Flight Center, Greenbelt, MD) and R. M. Hoffer (Purdue University, West Lafayette, IN). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 319-325. 10 refs.

Procedure 1 (P-1) was developed for the Large Area Crop Inventory Experiment (LACIE) and has been used extensively to develop land-use classification of agricultural areas. The P-1 approach requires that pixels (also called dots) of known identity must be located in the study scene. The entire area is clustered and the spectral classes formed are identified using the dots. The analyst need only locate and identify the dots. The rest of the work is done by the computer. The objective of the reported study was to evaluate the effectiveness of P-1's automated approach in a complex forest-land situation. The study site was located in the eastern half of the San

Juan National Forest in southwestern Colorado. The study showed that P-1 performed as well as the Multicluster Blocks approach on the rugged study area.
G.R.

A81-46056 **Change vector analysis - An approach for detecting forest changes with Landsat.** W. A. Malila (Michigan, Environmental Research Institute, Ann Arbor, MI). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 326-336. 9 refs. U.S. Department of Agriculture Contract No. 53-3197-8-19.

Periodic multiresource surveys and effective management of forest resources would be facilitated by capabilities for accurate detection of disturbances and other changes in land cover. Current techniques are not as effective and efficient as desired. This paper describes a recently developed digital method for change detection using multidate Landsat data. The method employs calculation of spectral change vectors from two different dates, prompting its name - Change Vector Analysis. The concept and a stratification procedure are described and their features are compared to other approaches. An implementation was tested that utilizes a linear transformation of Landsat data channels and spatial-spectral clustering of multidate data for the definition of spectrally homogeneous stand-like 'blobs'. Maps of two types of change, harvesting and regrowth, were produced and analyzed for a test site in Northern Idaho. (Author)

A81-46404 * **Sampling Landsat classifications for crop area estimation.** M. M. Hixson, B. J. Davis, and M. E. Bauer (Purdue University, West Lafayette, IN). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Sept. 1981, p. 1343-1348. 8 refs. Contract No. NAS9-14970.

An investigation was conducted to evaluate the effect of several sampling alternatives on the accuracy of crop area estimates made from classification of Landsat Multispectral Scanner (MSS) data. The specific objective was to assess the precision and the bias associated with alternative sampling schemes involving different numbers of several sampling unit sizes. The estimates achieved using the 5 by 6 nm segments were found to have the least precision of any sampling scheme tested. The estimates become more precise as the segment size decreases and more segments are taken. The precision of the 5 by 6 nm segments was significantly less than that of the pixel samples. None of the sampling schemes was significantly biased on the average, and none of the average estimates differed significantly from the population parameter. The maximum absolute deviation, however, was directly related to sampling unit size and should be considered in selection of a sampling unit.
G.R.

A81-46406 * **Microdensitometry to identify saline rangelands on 70-mm color-infrared aerial film.** J. H. Everitt, A. H. Gerbermann, and M. A. Alaniz (U.S. Department of Agriculture, Weslaco, TX). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Sept. 1981, p. 1357-1362. 15 refs. NASA Order S-58376-G.

Many of the world's rangelands are affected by salinity. The detection of these areas is important to range and resource managers who are concerned with productivity, condition, and animal carrying capacity. The reported study was conducted along a north-to-south flight line 24 km long and 1.6 wide in Starr County, TX. Everitt et al. (1977) described seven different native range sites (four nonsaline and three saline) along this flight line. The study showed that photointerpretation by microdensitometry could be used to identify saline range sites quantitatively on CIR (0.50 to 0.90 micrometers) aerial film (scales 1:19,000, 1:42,000, and 1:80,000) exposed in May 1976, June 1976, and June 1979. Microdensitometer readings made on CIR film using white or blue light generally gave the best separation between saline and nonsaline range sites. The differences in microdensitometry readings among saline and nonsaline range sites were caused by less plant cover on the saline sites.

A81-46895 * **Remote sensing of thermal radiation from an aircraft - An analysis and evaluation of crop-freeze protection methods.** R. A. Sutherland, H. E. Hannah, A. F. Cook, and J. D. Martsolf (Florida, University, Gainesville, FL). *Journal of Applied Meteorology,* vol. 20, July 1981, p. 813-820. 17 refs. Research supported by the University of Florida; Contract No. NAS10-8920.

Thermal images from an aircraft-mounted scanner are used to evaluate the effectiveness of crop-freeze protection devices. Data from flights made while using fuel oil heaters, a wind machine and an undercanopy irrigation system are compared. Results show that the overall protection provided by irrigation (at approximately 2 C) is comparable to the less energy-efficient heater-wind machine combination. Protection provided by the wind machine alone (at approximately 1 C) was found to decrease linearly with distance from the machine by approximately 1 C/100 m. The flights were made over a 1.5 hectare citrus grove at an altitude of 450 m with an 8-14 micron detector. General meteorological conditions during the experiments, conducted during the nighttime, were cold (at approximately -6 C) and calm with clear skies. (Author)

A81-47354 **The space engineering use efficiency for forest study.** P. I. Moroz and V. S. Kudriavtsev (Vsesoiuznoe Ob'edinenie Lesproekt, Moscow, USSR). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-108.* 7 p.

The principal factors determining the economic effect of space information use are given. They include an increase in labor productivity, a cut in expenditure and a shortening of periods of work by traditional means of replacement, an improvement in the nature-protective functions of forests, and a release of funds and their use in other industrial spheres. The use of space information for forestry purposes is seen as giving a considerable economic effect and as making it possible to solve tasks on a new qualitative level. The formula used in computing the economic effect is given.

A81-49344 **Assessing winter wheat dry matter production via spectral reflectance measurements.** J. K. Aase and F. H. Siddoway (U.S. Department of Agriculture, Northern Plains Soil and Water Research Center, Sidney, MT). *Remote Sensing of Environment,* vol. 11, Sept. 1981, p. 267-277. 27 refs.

A field experiment was located on a Williams loam soil, 11 km northwest of Sydney, MT. 'Roughrider', a winterhardy hard red winter wheat (Triticum aestivum L.) cultivar, was seeded to seven strands of from 0 to 100% (100% = 1,570,000 plants per hectare). On clear mornings, a hand-held radiometer was used to measure reflectances, corresponding to the Landsat multispectral scanner bands. Relationships between the normalized difference vegetation index as determined from late tillering until the beginning of flowering growth stages, and end-of-season straw and total dry matter clearly established the potential of remote sensing for predicting straw and total dry-matter yield. The prediction of dry-matter production is useful in providing an estimate of residue production for erosion control and as a potential source for feed and energy.

A81-49347 **Thermal vegetation canopy model studies.** J. A. Smith, K. J. Ranson, D. Nguyen, L. Balick (Colorado State University, Fort Collins, CO), L. E. Link (U.S. Army, Environmental Laboratory, Vicksburg, MS), L. Fritschen (Washington, University, Seattle, WA), and B. Hutchison (NOAA, Atmospheric Turbulence and Diffusion Laboratory, Oak Ridge, TN). *Remote Sensing of Environment,* vol. 11, Sept. 1981, p. 311-326. 29 refs. Grants No. DACW39-77-C-0073; No. DAAG29-79-C-0199.

An iterative-type thermal model applicable to forest canopies was tested with data from two diverse forest types. The model framework consists of a system of steady-state energy budget equations describing the interactions of short- and long-wave radiation within three horizontally infinite canopy layers. A state-space formulation of the energy dynamics within the canopy is used which permits a factorization of canopy geometrical parameters from canopy optical and thermal coefficients as well as environmental driving variables. Two sets of data characterizing a coniferous (Douglas-fir) and deciduous (oak-hickory) canopy were collected to evaluate the thermal model. The results show that the model approximates measured mean canopy temperatures to within 2 C for relatively clear weather conditions and deviates by a maximum of 3 C for very hazy or foggy conditions.

In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 37-42. 20 refs.

The evaluation of crop growth and field crop acreage from aerial imagery was begun by Agriculture Canada in the mid 1960's. By 1970, the studies were enlarged to include spectral data on crops and soils using a wide range of photographic and electronic measuring systems carried over the fields by both aircraft and satellites. During the last 15 years, these studies have repeatedly shown that certain groups of crops, types of crop losses, and crop growing conditions could be readily determined and their areal distribution in a crop district, region, or province accurately measured (e.g., corn, oil seeds, cereal crops, and fallowland). Growing conditions have been evaluated in recent years from Landsat imagery in dryland cereal growing areas for spring wheat and winter wheat.

A81-49760 # **Application of temporal Landsat forest digital data for updating the Yukon RRAMS data base using Aries.** Y. J. Lee (Pacific Forest Research Centre, Victoria, British Columbia, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 73-80. 9 refs.

The paper examines the effectiveness of temporal Landsat forest digital data as input to update the Yukon information retrieval system for renewable resources and management statistics (Yukon RRAMS). The temporal Landsat MSS data for a portion of the Lake Laberge Ecoregion were enhanced to emphasize softwood and hardwood stands. These enhanced images were used to locate training areas for supervised maximum likelihood classification. The results of the supervised classification were geometrically corrected and referenced to UTM grid cells. A summary of percentage occupancy in each 1/4-UTM grid cell by forest land classes was available for direct input to update the Yukon RRAMS data base.

A81-49766 # **Integration and comparison of SAR and MSS data for potato crop area estimation.** D. G. Goodenough, P. M. Teillet, and B. Guindon (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 127-142. 9 refs. Research supported by the Department of Agriculture of Canada and New Brunswick Department of Agriculture and Rural Development.

Airborne SAR and Landsat MSS imagery was obtained in the summer of 1978 for an agricultural site located near Grand Falls, New Brunswick. In order to compare the performances of these two sensors, it was necessary to overlay the imagery on a common map (UTM) grid. Landsat imagery was corrected on the DICS system at CCRS. For the high-resolution airborne SAR data, a new rectification procedure was developed which models the aircraft flight parameters and uses terrain information in the form of a digital terrain model to remove image distortions introduced by topographic relief. In addition, using a feature selection technique, it was determined which combination of MSS and radar channels provided the greatest separability among the major target types in the Grand Falls area (i.e., potatoes, grains, pasture, fallow, and forest). B.J.

A81-49770 # **SAR image response over a conifer regeneration site.** E. Wedler, S. Pala, and A. Jano (Ministry of Natural Resources, Ontario Centre for Remote Sensing, Toronto, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 179-186. 5 refs.

A81-49782 # **Principal components enhancements versus classifications of Landsat images for forestry applications (Les accentuations numériques d'images Landsat contre les classifications automatisees pour la cartographie vegetale).** J. Beaubien (Ministère de l'Environnement, Centre de Recherches Forestières des Laurentides, Sainte-Foy, Quebec, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 301-305. In French.

Studies on the potential of Landsat data applied to forest vegetation inventory are becoming numerous; most are based on automated classifications, mainly supervised classification. As a result of two projects in Quebec, on the Laurentian Plateau and on the North Shore, the usefulness of two algorithms, i.e., classifications and principal component digital enhancements, is compared and discussed. Good color enhancement seems to give more information on forest vegetation cover than automated classifications. Color enhancement can be used in the field and interpreted as a color aerial photograph. The interpreter's knowledge and experience in forestry are used to produce a vegetation map based on field sampling. Classifications offer the advantages of automatically producing a map and of rapidly yielding the area occupied by each class; but depending on the complexity of the forest territory concerned and on the training sets, precision of results can be variable, especially when dealing with many classes.

A81-49784 # **Rapeseed - Guidelines for operational monitoring.** R. J. Brown, F. J. Ahern, R. A. Ryerson, K. P. B. Thomson, D. G. Goodenough, J. A. McCormick, and P. M. Teillet (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute. 1981, p. 321-330. 8 refs.

Ground spectral measurements, airborne multispectral scanner (MSS) and Landsat MSS data were used to determine the phenological window during which rapeseed can be separated from its confusion crops on Landsat imagery. Ground spectroscopy measurements were used to predict the probability of correct classification of rapeseed and the results were confirmed using Landsat imagery acquired on three dates throughout the growing season. It was found that there are two phenological windows during which rapeseed can be reliably distinguished. One window corresponds to the period when the rapeseed is in bloom and the other when peas and the small grains are ripening.

A81-49785 # **Research on assessment of the recreational value of forests using Landsat digital data.** H. Amano. In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 331-337. 6 refs.

The process of assessing the recreational values of forests and benefits thereof to the urban society by utilizing Landsat and complementary Japanese National Statistics is described. The study area selected (about 800,000 ha) was the Northern Kanto districts of Japan, located within 100 km north of Tokyo. Landsat data tapes were used to produce a digital map which consisted of seven land use classes. From this digital map, the forest distribution pattern and the degree of separability between forested and urban areas were expressed as Morisita's and Gini's index, respectively. The results show that the Landsat digital map is valuable for the estimation of quantitative recreation values of forest in relation to the urban area. In addition, Landsat data are in digital form, so that such maps can easily be processed.

A81-49786 # **Colour - The critical photointerpretation element in the identification of rangeland plant communities on colour and colour-infrared aerial photography.** E. K. Watson and A. L. van Ryswyk. In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 339-349. 11 refs. Research supported by the Department of the Agriculture of Canada.

Although a review of the literature shows that color-infrared is preferred over ordinary color film for range vegetation identification, the identification of variably colored grasses, forbs and shrubs becomes difficult due to the following properties of color-infrared film: (1) blue and green plants appear as similar magenta hues; (2) senescent yellow and white grasses both appear white; (3) purples, reds and red-browns appear as hues of yellow; and (4) the interaction of non-green flowers or stems with the color of the plant to yield a color shift. The elements of photointerpretation for the identification of some dominant range plant species are presented, with emphasis on the interactions of plant colors with multidate-multiscale color and color-infrared photography. Among the elements of photointerpretation treated are growth form distribution, habitat, pattern and texture. O.C.

A81-49787 # **Photointerpretation of fire damage to trees in a ponderosa pine/bunchgrass community.** P. A. Murtha, A. H. Johnson, and R. M. Strang (British Columbia, University, Vancouver, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute 1981, p. 351-359. 16 refs. Research supported by the Natural Sciences and Engineering Research Council, British Columbia Ministry of Agriculture, and Environment Canada.

This paper reports on the application of a new technique for photointerpretation of fire damage to trees in a ponderosa pine/bunchgrass community in British Columbia, reviews pertinent details of a 1978 fire-ecology study, and discusses aspects of photointerpretation of vegetation damage. Photointerpreted damage classes and optical densitometry to determine spectral-ratio deviations are suggested for photointerpretation of fire-related tree damage. The approach was tested on large-scale color-infrared aerial photographs of the fire-ecology plots. The results indicate that a combination of visual photointerpretation and calculated spectral ratio deviations provide a reliable photointerpretation technique for determination of fire impact on trees in the rangeland plant community. The remote sensing results are supported by independently-derived ground-based fire data. (Author)

A81-49789 # **The application of thermography for locating potential frost pockets in forest cutovers.** G. R. Lawrence (Ministry of Natural Resources, Ontario Centre for Remote Sensing, Toronto, Canada) and A. Banner (Intertech Remote Sensing, Ltd., Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 369-376. 14 refs.

Cutover areas in three study sites were imaged in May with the aid of an airborne thermal scanner. Profiles of ground temperature, air temperature at 10 cm, and radiant temperature using a PRT-10 were prepared on two nights in November under similar weather conditions at a selected ground truth site. The data were compared with air temperature measurements done at the time of the overflight. The effects of nocturnal air drainage and pooling are successfully shown by the imagery. The study suggests that thermography holds promise for delineating relative frost hazards across forest cutovers. C.R.

A81-49791 # **The application of remote sensing techniques for an ecological land survey of the snow goose colony at Cape Henrietta Maria, Hudson Bay.** G. H. Wickware, D. W. Cowell (Environment Canada, Lands Directorate, Burlington, Ontario, Canada), R. A. Sims (Environment Canada, Canadian Forestry Service, Sault Ste. Marie, Ontario, Canada), and R. K. Ross (Canadian Wildlife Service, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 387-395. 10 refs.

A large expanding snow goose colony in the Cape Henrietta Maria area of Hudson Bay was studied with the aid of a multilevel remote sensing program. Training sites for each habitat were selected using 1:2000 scale 70 mm color and color infrared photography, while land systems were delineated using 1:60,000 scale black and white photography. Population estimates were made by means of a modified technique employed by Kerbes (1975), and a stratified random sample of all negatives within the colony's boundaries was selected to give overall areal coverage of 10%. Results of nesting density counts show a large increase in breeding pairs with only a small increase in the areal extent of the colony itself, and highest nest concentrations occur in the thicket meadow marsh and the graminoid brackish meadow marsh which are nearest to fluvially dominated areas and areas with a high density of brackish coastal lakes and ponds. D.L.G.

A81-49794 # **The discrimination of cereal crops and legumes using reflectance data in the Landsat bandpasses.** M. J. Duggin (New York, State University, Syracuse, NY) and G. C. Cooney (McQuarie University, Sydney, Australia). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 421-426. 5 refs. Research supported by the U.S. Department of Agriculture.

An example of the type of feasibility study which could usefully precede remote sensing surveys of, for example, different crop types or forest stands consisting of different tree types, is examined. The ground-level reflectance properties of several cereal crops and legumes are measured radiometrically for the Landsat satellite multispectral scanner (MSS) bandpasses on two occasions during the growth season. Multivariate analysis of the variance of the reflectance factor variables for the scanner bandpasses MSS 4 (500-600 nm), MSS 5 (600-700 nm), MSS 6 (700-800 nm), MSS 7 (800-1100 nm) and for log (base 10) MSS 7/5 shows that on each date the nine plant types are separable on the basis of reflectance properties. C.R.

A81-49799 # **Thermal inertia mapping of some areas of Quebec based on aerial and HCMM satellite data (Cartographie de l'inertie thermique de certains secteurs du Québec à partir de données aériennes et du satellite H.C.M.M.).** M. Bernier, R. Brochu, and F. Bonn (Sherbrooke, Université, Sherbrooke, Quebec, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 473-482. 17 refs. In French.

An example of the application of aerial and HCMM data to the construction of thermal inertia maps indicating soil moisture contents in regions of eastern Canada is presented. The aerial data was obtained in two flights at 1800 m over agricultural lands in the vicinity of Sherbrooke by means of thermography during day and night flights and multispectral photography during the day flight; preliminary treatment involved the division of the 5 x 1.25 km area into 400 pixels 125 m on a side and the acquisition of soil type, soil drainage, soil utilization and slope data for each pixel. Soil temperatures estimated from the thermographic data and albedos computed from an average of the reflectivities in the yellow-green, red and infrared spectral bands are used to derive the thermal inertia of each pixel. Examination of the thermal inertia distribution in comparison with soil drainage data indicates that the values of thermal inertia may be used to determine soil moisture in agricultural areas only if the complex relation between soil and vegetation temperature has been determined. In the case of HCMM data, obtained in the wavelength bands 0.5-1.1 and 10.5-12.0 microns with a pixel size of 481.5 m covering the entire southeast of Quebec, it is found that the resolution is too low to allow the use of the concept of thermal inertia in differentiating between regions of differing soil water content. A.L.W.

A81-49810 # **A simulation of Thematic Mapper performance in an agricultural application.** F. J. Ahern, R. J. Brown, D. G. Goodenough, and K. P.-B. Thomson (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 585-596. 13 refs.

The Thematic Mapper (TM) to be flown on Landsat-D is expected to furnish significantly improved agricultural classification over the present Landsat multispectral scanner (MSS) because of its improved spectral bands and greater spatial, spectral, and radiometric resolution. It is noted that the expected performance of the TM in an agricultural application has been simulated from airborne MSS data as part of a CCRS project entitled The Saskatchewan Rangeland/Rapeseed Study. The performance of the TM is compared with the simulated and actual performance of the present Landsat multispectral scanner. It is pointed out that the TM bands can be combined in a number of familiar and unfamiliar color composites. Some of these are created and displayed to demonstrate their value for agricultural applications. Using restricted versions of the simulated TM data set, the improvements in spectral classification with varying band combinations and varying radiometric and spatial resolution are determined. C.R.

A81-49615 # **Evaluation of Thematic Mapper bands - A first step in feature selection.** K. Staenz, F. J. Ahern, and R. J. Brown (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 625-634. 16 refs.

It is pointed out that the Thematic Mapper (TM) on Landsat-D will produce more than 10 times the data than the present Landsat Multispectral Scanner (MSS) because of its increased dimensionality (7 bands) and improved ground resolution (30 m). However, the impact upon image analysis can be reduced by analyzing a subset of the data and thus reducing the dimensionality. A study is made to identify these possible subsets. The correlation between the reflectance factors of nine common crop types and one soil type in the first six TM spectral bands is determined. In similar fashion, the correlations between the Landsat MSS bands are calculated as a test of the available data set and procedure. C.R.

In order to better understand the physical processes involved in defoliation assessment from remotely sensed data, a field study was designed to investigate the effect of forest canopy closure and other environmental variables on incoming solar radiation. Diffuse radiation measurements were recorded in red, infrared, and middle infrared wavelengths using the Mark 2 three band field radiometer. Results to date indicate that the percent canopy closure is the single most important variable affecting incoming solar radiation. In the visible and near infrared regions, interaction between time of day and date (defined later as solar zenith angle) also affect radiometric response. Aspect has only limited influence on radiance response. These same variables do not influence middle infrared response, however. Uniformity of the forest canopy appears to be more important. These results are compared to LANDSAT MSS classification results of gypsy moth defoliation. A.R.H.

Soil moisture data acquired to support the development of algorithms for estimating surface soil moisture from remotely sensed backscattering of microwaves from ground surfaces are presented. Aspects of field uniformity and variability of gravimetric soil moisture measurements are discussed. Moisture distribution patterns are illustrated by frequency distributions and contour plots. Standard deviations and coefficients of variation relative to degree of wetness and agronomic features of the fields are examined. Influence of sampling depth on observed moisture content an variability are indicated. For the various sets of measurements, soil moisture values that appear as outliers are flagged. The distribution and legal descriptions of the test fields are included along with examinations of soil types, agronomic features, and sampling plan. Bulk density data for experimental fields are appended, should analyses involving volumetric moisture content be of interest to the users of data in this report. A.R.H.

SOIL MOISTURE INFERENCES FROM THERMAL INFRARED MEASUREMENTS OF VEGETATION TEMPERATURES

R. D. Jackson, Principal Investigator Mar. 1981 14 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of Interior, and Agency for International Development ERTS
(Proj. AgRISTARS)
(E81-10184; NASA-CR-160954; EW-U1-04068; JSC-17125) Avail: NTIS HC A02/MF A01 CSCL 08M

Thermal infrared measurements of wheat (Triticum durum) canopy temperatures were used in a crop water stress index to infer root zone soil moisture. Results indicated that one time plant temperature measurement cannot produce precise estimates of root zone soil moisture due to complicating plant factors. Plant temperature measurements do yield useful qualitative information concerning soil moisture and plant condition. Author

ERIM-152400-1-X) Avail: NTIS HC A12/MF A01 CSCL 02C

A user's manual for the classification component of the FY-81 U.S. Corn and Soybean Pilot Experiment in the Foreign Commodity Production Forecasting Project of AgRISTARS is presented. This experiment is one of several major experiments in AgRISTARS designed to measure and advance the remote sensing technologies for cropland inventory. The classification procedure discussed is designed to produce segment proportion estimates for corn and soybeans in the U.S. Corn Belt (Iowa, Indiana, and Illinois) using LANDSAT data. The estimates are produced by an integrated Analyst/Machine procedure. The Analyst selects acquisitions, participates in stratification, and assigns crop labels to selected samples. In concert with the Analyst, the machine digitally preprocesses LANDSAT data to remove external effects, stratifies the data into field like units and into spectrally similar groups, statistically samples the data for Analyst labeling, and combines the labeled samples into a final estimate. THE ENVIRONMENTAL VEGETATION INDEX: A TOOL POTENTIALLY USEFUL FOR ARID LAND MANAGEMENT

T. I. Gray, Jr. and D. G. McCrary, Principal Investigators Mar. 1981 6 p refs Repr. from Vol. of Extended Abstr.: 15th Conf. on Agr. and Forest Meteorol. and 5th Conf. on Biometeorol., 1981 p 205-207 Presented at the 15th Conf. on Agr. and Forest Meteorol. and 5th Conf. on Biometeorol., Anaheim, Calif., 1-3 Apr. 1981 Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Proj. AgRISTARS)
(E81-10191; NASA-CR-160978; EW-NI-04076; JSC-17132) Avail: NTIS HC A02/MF A01 CSCL 02C

The NOAA-6 AVHRR data sets acquired over South Texas and Mexico during the spring of 1980 and after Hurricane Allen passed inland are analyzed. These data were processed to produce the Gray-McCrary Index (GMI's) for each pixel location over the selected area, which area contained rangeland and cropland, both irrigated and nonirrigated. The variations in the GMI's appear to reflect well the availability of water for vegetation. The GMI area maps are shown to delineate and to aid in defining the duration of drought; suggesting the possibility that time changes over a selected area could be useful for irrigation management. A soil water computer model that uses the IBM Continuous System Modeling Program III to solve the dynamic equations representing the soil, plant, and atmospheric physical or physiological processes considered is presented and discussed. Using values describing the soil-plant-atmosphere characteristics, the model predicts evaporation, transpiration, drainage, and soil water profile changes from an initial soil water profile and daily meteorological data. The model characteristics and simulations that were performed to determine the nature of the response to controlled variations in the input are described the results of the simulations are included and a change that makes the response of the model more closely represent the observed characteristics of evapotranspiration and profile changes for dry soil conditions is examined. LEMSCO-15936; JSC-16850) Avail: NTIS HC A03/MF A01 CSCL 02C

During the Large Area Crop Inventory Experiment, spring wheat planting date and crop development stage estimates based on historical normals were improved by the use of the Feyerherm planting date and Robertson spring wheat crop calendar models. The Supporting Research Crop Calendar Project element modified the Robertson model to reduce bias at cardinal growth stages within the growing season. These models were tested in 1980 along with a state-of-the-art barley model (Williams) against a ground-truth data set from 49 calendar year 1979 segments in the U.S. Great Plains spring wheat and barley region. The results of the Domestic Crops and Land Cover Classification and Clustering study on large area crop estimation using LANDSAT and ground truth data are reported. The current crop area estimation approach of the Economics and Statistics Service of the U.S. Department of Agriculture was evaluated in terms of the factors that are likely to influence the bias and variance of the estimator. Also, alternative procedures involving replacements for the clustering algorithm, the classifier, or the regression model used in the original U.S. Department of Agriculture procedures were investigated. CROP AREA ESTIMATION USING GROUND-GATHERED AND SAMPLED LANDSAT DATA
James Weldon Mergerson May 1981 23 p refs
(PB81-192783; AGESS-810408) Avail: NTIS HC A02/MF A01 CSCL 02C

A comparative study in which a procedure using ground gathered data and classified LANDSAT data for estimating crop area were compared to procedures using ground gathered data and sampled LANDSAT data is described. Data from parts of Iowa and Missouri were used. Unitemporal data were used in Iowa and multitemporal data were used in Missouri. Results indicate that some sampling schemes can be used without any significant difference in the crop area estimates, but with a large reduction in cost for corn, soybeans, and winter wheat. GRA

AGRICULTURAL WATER DEMAND PREDICTION USING REMOTE SENSING TECHNOLOGY FOR GEORGIA RESOURCE MANAGEMENT
John R. Jensen and Donald L. Chery Dec. 1980 57 p refs Sponsored by Dept. of Interior Prepared in cooperation with Georgia Univ., Athens
(PB81-184137; W81-02428; ERC-07-80; OWRT-A-083-GA(1)) Avail: NTIS HC A04/MF A01 CSCL 02C

A method to assess the amount of water pumped from aquifers or the effect of intensive agriculture on watershed water balance (WWB) is discussed. Certain measurements are needed to model WWB. The major flow components are (1) rainfall input, and (2) out flows of evapotranspiration (ET) and surface and subsurface discharge. ET is determined by careful selection and analysis of LANDSAT digital data to determine an agriculture region's land cover; ET was used in a hydrologic water balance model. Digital image processing of LANDSAT-3 data discriminated major field crops and forests in Tift County, Georgia, for a water use assessment. GRA

SPECTRAL PROPERTIES OF ARIZONA SOILS AND RANGELANDS AND THEIR RELATIONSHIP TO LANDSAT DIGITAL DATA Ph.D. Thesis
Emilio Hubert Horvath 1981 196 p
Avail: Univ. Microfilms Order No. 8116702

The relationships between the spectral properties of Arizona soils and rangelands and their characteristics were studied. The per cent reflectance of soils was determined using a multispectral hand-held radiometer, and the spectral response of Arizona rangeland sites was measured by scanners aboard on orbiting satellite. These spectral properties were related, by means of stepwise multiple regressions, to various soil and site characteristics. It was shown that for central and southern Arizona rangelands, it is possible to define specific relationships between site characteristics and satellite measured spectral response. Less than ten site characteristics and their interactions explain considerable portions of the variability between mapping units for a given survey. These relationships are unique for specific locations, but they could easily be developed for a survey area and effectively used in the mapping process. Dissert. Abstr.

Local area coverage data acquired aboard the TIROS-N satellite family by the advanced very high resolution radiometer systems was examined to determine the agricultural information current. Albedo differences between channel 2 and channel 1 of the advanced very high resolution radiometer LAC (called EVI) are shown to be closely correlated to the Ashburn vegetative index produced from LANDSAT multispectral scanner data which have been shown to vary in response to 'greenness', soil moisture, and crop production. The statistical correlation between the EVI and the Ashburn Vegetative Index (+ or - 1 deg) is 0.86. Author

Procedures and techniques for providing analyses of meteorological conditions at segments during the growing season were developed for the U.S./Canada Wheat and Barley Exploratory Experiment. The main product and analysis tool is the segment-level climagraph which depicts temporally meteorological variables for the current year compared with climatological normals. The variable values for the segment are estimates derived through objective analysis of values obtained at first-order station in the region. The procedures and products documented represent a baseline for future Foreign Commodity Production Forecasting experiments. Author

PHOTOGRAPHIC TECHNOLOGY DEVELOPMENT PROJECT: TIMBER TYPING IN THE TAHOE BASIN USING HIGH ALTITUDE PANORAMIC PHOTOGRAPHY Final Report
J. F. Ward Jun. 1981 42 p refs Sponsored in part by Dept. of Agriculture Original Contains Color Illustrations
(Grant NGR-53-3182-0-29)
(NASA-CR-161082; LEMSCO-15691) Avail: NTIS
HC A03/MF A01 CSCL 14E

Procedures were developed and tested for using KA-80A optical bar camera panoramic photography for timber typing forest land and classifying nonforest land. The study area was the south half of the Lake Tahoe Basin Management Unit. Final products from this study include four timber type map overlays on 1:24,000 orthophoto maps. The following conclusions can be drawn from this study: (1) established conventional timber typing procedures can be used on panoramic photography if the necessary equipment is available, (2) The classification and consistency results warrant further study in using panoramic photography for timber typing; and (3) timber type mapping can be done as fast or faster with panoramic photography than with resource photography while maintaining comparable accuracy. LANDFORM-VEGETATION RELATIONSHIPS IN THE NORTHERN CHIHUAHUAN DESERT
Melvin B. Satterwhite and Judy Ehlen 29 Mar. 1981 21 p refs
(AD-A102896; ETL-R020) Avail: NTIS HC A02/MF A01 CSCL 08/6

The description and monitoring of environmental resources in arid regions can be a formidable undertaking requiring substantial resources. These efforts can be expedited by using remote sensing techniques. There remains, however, a need for correlating features that are readily extracted from the imagery with anticipated soil and vegetation conditions on the ground. Landform features provide a basis for the assessment of soil and vegetation conditions and these features can be readily identified from aerial photography and, to a certain extent, from LANDSAT imagery. The purpose of this study was to evaluate landform features as a basis for the assessment of soil and vegetation conditions. The study was conducted on 650,000 hectares in the northern Chihuahuan Desert (south-central New Mexico and western Texas). Landform conditions and plant communities were identified from an analysis of stereo panchromatic aerial photography, and were evaluated in detail by intensive field investigations. Soil conditions of the various landforms identified from the imagery were established by the laboratory analysis of field samples. The distribution of the plant communities was closely correlated to landform conditions and the edaphic factors affecting plant-available soil-water, soil texture, soil depth, infiltration, and slope. GRA

SCATTEROMETER MEASUREMENTS ON CROP AND SOIL SURFACES
Thuy LeToan *In* ESA Coherent and Incoherent Radar Scattering from Rough Surfaces and Vegetated Areas May 1981 p 99-110 refs
Avail: NTIS HC A08/MF A01

Scatterometer experiments on soil moisture detection and crop monitoring are summarized. Radar backscatter is found to be correlated to and sensitive to the soil moisture of the upper layer 0 to 5 cm at frequencies of 4 to 5 GHz and at an angle of incidence of 0 to 20 deg. The influence of soil texture on dielectric properties of moist soils led to defining a moisture parameter that accounts for this dependence. Research on crop identification and monitoring pointed out the large fluctuations of backscattering coefficient with time during the growing season, thus the need of multidate data for crop identification potentialities of radar for crop parameter detection and growth stage determination. Daily antecedant precipitation indexes (API) values were calculated from precipitation amounts at each rain gage on the Washita River watershed; daytime thermal IR data from the watershed on July 24 was compared to July 13 daytime IR data covering the same area. Surface moisture conditions on the 13th were drier. A good relationship is apparent between thermal temperature difference around each rain gage site and the corresponding API value on July 24, 1978. Thirty-six hour day/night registered IR data at each rain gage on October 16/17 was compared to the corresponding daily API. Thermal patterns associated with an October 8 storm were still detectable but not as strongly as day/day differences between July 24 and 13. Analysis began on the IR data from the 10 HCMM CCT's tapes, received as well as on GOES visible and IR data for July 21 and 28, 1978. The spatial and thermal resolution in the latter were too gross to detect minor soil moisture differences which were detectable during the same period on HCMM thermal data. A.R.H.

A PROJECT TO EVALUATE MOISTURE STRESS AND PHENOLOGICAL FACTORS IN CORN AND SOYBEAN AREAS OF SOUTHWESTERN AND SOUTH-CENTRAL MINNESOTA
R. H. Rust and Pierre Robert, Principal Investigators *In its* A Study of Minn. Land and Water Resources Using Remote Sensing, Vol. 14 1 Jan. 1981 18 p refs Original contains color imagery. Original photography may be purchased from the EROS Data Center, Souix Falls, S.D. 57198. ERTS

Avail: NTIS HC A05/MF A01 CSCL 02C

The capability of aerial color infrared photography for identifying and locating soilscapes most susceptible to drought development or those having different soil drainages was evaluated. Although west central and southwestern Minnesota had a significant precipitation deficit during the 1980 crop season, indications of plant stress were not observed either from ground observation or through interpretation of imagery at the selected sampling sites. Well-drained soil was more depleted during the 'maximium green peak' period than the poorly drained soil. The recharge was more evident on the poorly drained site in the fall. Measurements of leaf water potential and leaf temperature for corn and soybean leaves were made by multispectral band scanner and recorded for analysis. A.R.H.

Avail: NTIS HC A06/MF A01 CSCL 02C

Accomplishments made since March 1980 in developing and testing procedures to provide more objective and reliable crop production forecasts several times during the growing season as well as improved preharvest estimates for a range of countries and crops are summarized. Results of classification procedures verification and simulated aggregation tests are included as well as evaluations of crop stage model performance. The status of wheat/barley and corn/soybean experiments is examined and the extension of the methods used in the experiments to multicrop sampling and aggregation is considered. The foreign similarity region approach, objectives and scopes for FY-81, and major changes in the FY81/82 plan are examined. A.R.H.

CROP PHENOLOGY AND LANDSAT-BASED IRRIGATED LANDS INVENTORY IN THE HIGH PLAINS: APPENDICES
Final Report

[1981] 201 p refs ERTS
(Grant NAG2-57)
(E81-10172; NASA-CR-164565) Avail: NTIS
HC A10/MF A01 CSCL 02C

Data collected in an effort to produce a master crop calendar in map and tabular format for the High Plains Aquifer are presented. Contents include: a key to the counties in the High Plains Aquifer; USDA Economics and Statistic Service data for 1979; Agricultural Stabilization and Conservation Service data for 1979 and 1980; Cooperative Extension Service data for 1979 and 1980; recording methods from questionnaire; scatterplots portraying ASCS, Extension and ESS data; crop irrigation maps; and weekly summary based optimal LANDSAT dates. A bibliography is included. A.R.H.

HC A07/MF A01 CSCL 02C

The need to determine the volume of ground water being pumped from the High Plains region aquifer (HPRA) for irrigation can be met using a LANDSAT based remote sensing system. Crop calendar differences in such a large area (most of Nebraska, half of Kansas, the Texas and Oklahoma Panhandle areas, a portion of South Dakota, and the eastern parts of Wyoming, Colorado, and New Mexico) can introduce local influences on the interpretation of the algorithms employed. A method is described for determining the optimal dates for inventorying various crops grown on these irrigated lands in support of an effort to identify irrigated and develop a computer model for predicting aquifer response to changes in ground water development. A crop calendar for the crops grown in the HPRA is presented. A.R.H.

EVALUATION OF LANDSAT DATA ANALYSIS FOR FOREST SURVEY **Final Report**

R. P. Mroczynski, R. M. Hoffer, and R. F. Nelson, Principal Investigators 1980 47 p refs Sponsored by NASA and US Forest Service Original contains imagery. Original photography may be purchased from the EROS Data Center, Sioux Falls, S.D. 57198. ERTS
(E81-10175; NASA-CR-164754 LARS-TR-101880) Avail: NTIS HC A03/MF A01 CSCL 02F

LANDSAT classification results are compared to current survey statistics for forest/non-forest classes in the northeastern aspen-birch survey unit in Minnesota. The results help to provide: the first step in a land change monitoring system; estimates of cost of local and regional land use statistics obtained from LANDSAT; and information regarding the degree of information that can be extracted from LANDSAT. The possibility of detecting disturbance on survey plots was determined. This possible application of forest survey ground plots as training material for computer-aided LANDSAT classification is discussed. T.M.

CSCL 12A

The maximum likelihood estimation of parameters in mixture model is discussed, the use of ancillary information in the maximum likelihood process is shown, and the strong consistency of the maximum likelihood estimator is proven. A study of these three areas leads to a threshold maximum estimator which estimates the number of classes in a mixture model. This estimator, along with the iteration procedure by which it is calculated, is described. Local and global results for the procedure are given. A.R.H.

CSCL 02C

The processing of Australian data during LACIE transition year resulted in identification of the major issues in classification, sampling/aggregation, yield, and production. Classification issues which were identified and/or partially resolved are those concerned with early-season and late-season wheat varieties, abandonment, confusion crops, and ancillary data problems, especially crop calendar problems. Labeling accuracy results and ground-truth data from a New South Wales sample segment are included with results, conclusions, and recommendations for crop labeling and labeling-related issues. A CROP MOISTURE STRESS INDEX FOR LARGE AREAS AND ITS APPLICATION IN THE PREDICTION OF SPRING WHEAT PHENOLOGY

P. C. Doraiswamy and D. R. Thompson, Principal Investigtors Mar. 1981 28 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior and Agency for International Development Prepared in cooperation with Lockheed Engineering and Management Services Co., Inc., Houston, Tex. ERTS
(Contract NAS9-15800; Proj. AgRISTARS)
(E81-10202; NASA-TM-84035; SR-L1-04064; JSC-17121;
LEMSCO-16216) Avail: NTIS HC A03/MF A01 CSCL 02C

An agrometeorological crop phenology model for spring wheat is presented which incorporates the photothermal concept suggested by the Robertson crop calendar model for spring grains. This model differs from the Robertson model in that it incorporates a crop moisture stress index as a model parameter. The data used to assess the effects of moisture stress on phenological development were derived from the literature. In certain parts of the model, it is suggested that remotely sensed spectral data may be used as inputs. The model is applicable to large area forecasting and incorporates the influence of soil moisture deficit on phenological development. Model outputs representing a moisture-stressed condition and an adequate moisture condition are discussed for growth observations in North Dakota and Montana. A.R.H.

EXPERIMENT PLAN: ROW AND ROUGHNESS EFFECTS ON DEPENDENCE OF ACTIVE MICROWAVE MEASUREMENTS OF SOIL MOISTURE

J. F. Paris and L. M. Arya, Principal Investigators Oct. 1980 38 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development Prepared in cooperation with Lockheed Engineering and Management Services Co., Inc., Houston, Tex. ERTS
(Proj. AgRISTARS)
(E81-10209; NASA-TM-84048; SM-J0-00613; JSC-16822; LEMSCO-15181) Avail: NTIS HC A03/MF A01 CSCL 08M

To increase understanding of the effects of agricultural tillage practices and aspect angle on the interpretation of active microwave data over bare agricultural fields, an experiment is planned for determining the effects of different combinations of row spacings and heights at L-band, C-band, and Ku-band for viewing angles of 10 deg, 20 deg, 30 deg, 40 deg, and 50 deg and for HH polarization. The objectives give scope, approach, test site description, and data requirements for the experiment. The data is to be gathered at the Prairie View A&M University, Texas test site and at Jornada, New Mexico. A data analysis plan is proposed including error analysis for estimating the modulation function. A.R.H.

EXPERIMENTAL INVESTIGATION OF THE PHYSICAL FUNDAMENTALS FOR REMOTE SENSING OF SOIL AND VEGETATION MOISTURE BY ACTIVE INFRARED REFLECTANCE SPECTROSCOPY USING CO2 LASER TECHNIQUE
Final Report

Joerg Boscher and Frank Lehman (Zentralstelle fuer Geo-Photogrammetrie und Fernerkundung) Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 39 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-80-037; BF-R-64-028-01; ISSN-0170-1339) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 8.20

The application of active infrared spectroscopy to remote sensing of soil moisture was examined. The reflectance of water and dry and moist soil samples, including selected minerals and natural soils, was measured with the emission lines of the CO2 laser. The reflectance spectra of the samples change in a characteristic way with increasing moisture. Spectral differences of the dry materials are reduced with increasing water content, enabling the use of the ratio of the reflected intensities of two CO2 laser lines to determine the moisture content of surfaces. The airborne remote sensing system (DIALEX) developed for differential absorption spectroscopy of gases can be employed for two channel reflectance spectroscopy. Applications of this moisture sensing method in the fields of mineral deposits prospecting, agriculture and forestry are discussed. Author (ESA)

A SELECTED BIBLIOGRAPHY: REMOTE SENSING APPLICATIONS IN WILDLIFE MANAGEMENT

David M. Carneggie, Donald O. Ohlen, and Lawrence R. Pettinger 23 Feb. 1981 24 p
(Contract DI-14-08-0001-16439)
(PB81-215881) Avail: NTIS HC A02/MF A01 CSCL 13B

This bibliography cites 165 selected technical reports, journal articles, and other publications on remote sensing applications for wildlife management. Developments in the use of remotely sensed data for wildlife habitat mapping, habitat inventory, habitat evaluation, and wildlife census are covered. The works cited were published between 1947 and 1979. GRA

02

ENVIRONMENTAL CHANGES AND CULTURAL RESOURCES

Includes land use analysis, urban and metropolitan studies, environmental impact, air and water pollution, geographic information systems, and geographic analysis.

A81-41061 # **Hurricane 'Flossie' /September 1978/ observed in the north Atlantic, by the Meteosat satellite (L'uragano 'Flossie' /Settembre 1978/ visto dal Meteosat sul nord Atlantico).** S. Zanni (Centro Nazionale di Meteorologia e Climatologia Aeronautica, Rome, Italy). *Rivista di Meteorologia Aeronautica*, vol. 41, Jan.-Mar. 1981, p. 33-42. 14 refs. In Italian.

The behavior of hurricane Flossie (September 1978) in the north Atlantic in terms of the monthly mean September circulation is interpreted. Some brief remarks and meteosynoptic suggestions regarding Flossie's genesis and development are presented, also in analogy with other similar hurricanes in this segment of the Atlantic ocean mainly in fall, season of highest tropical storm activity. Finally some interpretations of two Meteosat infra-red and water vapour images which show the maximum stage of Flossie moving sharply northward to the Atlantic extra-tropical latitudes are presented. (Author)

A81-41404 **Stratospheric sulfate from the Gareloi eruption, 1980 - Contribution to the 'ambient' aerosol by a poorly documented volcanic eruption.** W. A. Sedlacek, E. J. Mroz, and G. Heiken (California, University, Los Alamos, NM). *Geophysical Research Letters*, vol. 8, July 1981, p. 761-764. 5 refs.

While sampling stratospheric aerosols during July-August 1980 a plume of 'fresh' volcanic debris was observed in the Northern Hemisphere. The origin of this material seems to be a poorly documented explosive eruption of Gareloi volcano in the Aleutian Islands. The debris was sampled at an altitude of 19.2 km - almost twice the height of observed eruption clouds. Such remote, unobserved or poorly documented eruptions may be a source that helps maintain the 'ambient' stratospheric aerosol background. (Author)

A81-42281 # **Remote sensing and mapping of pastures (Distantsionnaia indikatsiia i kartirovanie pastbishch).** B. V. Vinogradov. *Issledovanie Zemli iz Kosmosa*, May-June 1981, p. 35-45. 24 refs. In Russian.

Aerial and space surveys were used to study the composition, structure, phenology, and dynamics of pastures. The topography method of pastural survey is discussed at several levels, ranging from the detailed (population) and elementary (biogenetic) to the local and regional. The most up-to-date method involves the determination of pastural changes caused by overgrazing. This is done by comparing repeated aerial and space photographs of the same territory and recording the pastural modifications of land use by means of overgrazing and desertification indicators during a single flight. J.F.

A81-43261 * **Application of remote sensing for California irrigated lands assessment.** L. Tinney, J. Estes (California, University, Santa Barbara, CA), S. Wall, and R. Colwell (California, University, Berkeley, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 689-693. Grant No. NsG-2208.

Recognizing the need for land use data as an input to State water planning, the California Department of Water Resources (DWR) and its predecessor agencies have conducted land use surveys since the late 1940's. In 1957 the California Water Plan was established. A statewide assessment is compiled every four to five years to review overall water resource conditions. Satellite remote sensing imagery, such as available from Landsat, has been recognized by DWR as a potential source of land use data. Analysis of Landsat imagery in connection with 'calibrating' data from low altitude photography and/or field checks can provide an economical means for providing a large scale, single year base inventory of general land use. The purpose of the Applications Pilot Test is to develop and document the use of Landsat for such an inventory. Towards the overall goal of developing an operational methodology that DWR could cost effectively implement four tasks have been specified. G.R.

A81-43263 **Remote sensing of bank erosion along the Missouri River, South Dakota.** P. H. Rahn (South Dakota School of Mines and Technology, Rapid City, SD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 697-700.

In South Dakota, rapid erosion and deposition occurs below the main stem dams on the Missouri River. A description is presented of the use of Landsat imagery to quantify the amount of erosion in a reach below Gavins Point Dam. Landsat imagery of the entire reach below Gavins Point Dam was obtained and compared and images were chosen based on available cloud-free days, for the days of May 30, 1973 and February 23, 1976. It is pointed out that satellite imagery adds a new dimension to fluvial studies by allowing for repetitive (temporal) coverage of a stream reach. The considered study shows that it is possible to periodically assess areas of erosion and deposition for the Missouri River. G.R.

A81-43523 # **Remote methods and desert conservation (Distantsionnye metody i okhrana prirody pustyn').** N. G. Kharin. Moscow, Izdatel'stvo Nauka, 1980. 104 p. 124 refs. In Russian.

The application of remote sensing methods in the study of desert resources for the prevention of destructive processes and the planning of desert reclamation are examined. Problems in the monitoring of natural resources to which remote methods may successfully be applied are considered, including the study of vegetation damage, land use, soil erosion and salinization, water resources and pollution and natural disasters, and space-borne, aerial and ground-based methods used in resource monitoring are presented. The application of multispectral aerospace photography for the thematic mapping of desert areas is then examined, with attention given to the determination of optimum spectral regions, the characteristics of the photographs obtained, map correction, and the feasibility of using the maps in the planning of conservation measures. Attention is also given to the application of remote methods in the mapping of conservation zones in desert regions and the study of natural preserves in arid regions. A.L.W.

A81-43533 **Comparison of sampling procedures and data analysis for a land-use and land-cover map.** K. Fitzpatrick-Lins (U.S. Geological Survey, Reston, VA). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Mar. 1981, p. 343-351. 9 refs.

The accuracy of the Tampa, Florida Land-Use and Land-Cover Map produced by the U.S. Geological Survey at a scale of 1:250,000 was estimated by the use of two separate sample selections, a manual sample selection, and a computer automated sample selection. A comparison of these two methods favors the second. The manual sample selection used a stratified systematic unaligned sampling technique. The computer-based automated sample selection first used a stratified systematic unaligned sampling technique followed by a random selection stratified by category to assure that all categories were adequately sampled. With the manual sample selection only six of the 26 categories were adequately represented, and nine were not represented at all. Using the computer-based sample selection, all 26 categories were represented. B.J.

A81-43534 **Spatial correlation effects upon accuracy of supervised classification of land cover.** J. B. Campbell (Virginia Polytechnic Institute and State University, Blacksburg, VA). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Mar. 1981, p. 355-363. 19 refs.

The Landsat 1 multispectral scanner imaged south central Virginia at six dates during the 1974 growing season. The examination of selected parcels of forest reveals the presence of positive continuity between MSS values at adjacent pixels, the degree of continuity varies from date to date, and according to MSS bands at a

given date. In at least some cases, it can be shown that estimates of category variances based on values at contiguous pixels yield low values relative to those based on random samples of the same area. These biased estimates can lead to overestimation of contrast between categories and to errors in supervised classification. Erroneously classified pixels may tend to cluster, thus increasing the opportunity for misinterpretation of errors as genuine land-cover parcels.
B.J.

A81-43733 * **Urban area update procedures using Landsat data.** D. L. Toll (NASA, Goddard Space Flight Center, Greenbelt, MD), J. A. Royal (General Electric Co., Space Systems Div., Beltsville, MD), and J. B. Davis (U.S. Bureau of Census, Geography Div., Washington, DC). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-1-E-1 to RS-1-E-17. 18 refs.

Landsat digital enhancements and classification maps are shown to be useful for updating the urban expansion of standard metropolitan statistical areas on a macro scale. Automated procedures for detecting nonurban to urban land coverage change using multitemporal Landsat data are investigated for five metropolitan areas, showing an overall delineation similar to that obtained from large scale aerial photography. The evaluated change detection procedures include image differencing, principal component transformation prior to differencing, and post classification comparison. Results show that image differencing techniques in MSS band 5 provide the most accurate land cover change detections.
J.F.

A81-43739 **From landforms to avian habitat - A look at topology.** J. E. Skaley (Cornell University, Ithaca, NY). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-2-E-1 to RS-2-E-8. 8 refs.

A landscape approach, in which basic topological relationships among shapes and patterns in the terrain are identified, has been used to predict local climate and potential songbird habitat. Geometric models and topological relationships among basic patterns are shown to provide a focus for quantifying and understanding relationships between terrain features. Three case studies are presented, exemplifying nature's tendency to repeat basic shapes and patterns which can be used to predict landscape properties. Illustrations are provided, showing topological shapes related to landform features, forest canopy characteristics, air flow patterns, and heating and cooling patterns. Associations between avian groups and different topological features and canopy structures are given. It is suggested that these relationships be examined in greater detail as a way of quantifying the interpretation process and improving landscape analysis.
J.F.

A81-43748 **Use of remote sensing in landscape stratification for environmental impact assessment.** J. A. Stanturf (Cornell University, Ithaca, NY) and D. G. Heimbuch (Heimbuch-Stanturf, Inc., Ithaca, NY). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. PS-2-A-1 to PS-2-A-11. 22 refs.

Landscape units, used in environmental impact assessment, are delineated by integrating remotely sensed data and available single-factor data. A remote sensing approach to landscape stratification is described, and shown to be superior to other approach that require single-factor maps under certain conditions. Flow charts show the steps necessary for developing classification criteria, delineating units and a map legend, and using the landscape units in impact assessment. The approach is then applied to assess impacts of a transmission line to illustrate the method.
J.F.

A81-43749 * **Texture measurements from Seasat - SAR images for urban land use interpretation.** F. Fasler (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Rainbow 80, Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. PS-2-B-1 to PS-2-B-10. 9 refs. Contract No. NAS7-100.

Different grey tones in Seasat Synthetic Aperture Radar (SAR) images for the same type of urban land cover considerably impair the possibilities of establishing automatic classification procedures for these types of data. Since the orientation of the main features like street patterns and buildings with respect to the azimuth angle of the radar antenna is the crucial factor for the observed differences in grey tone, prior information on these elements and special processing of the data would be required to eliminate this effect. Another approach suggested in this paper is to make use of the textural information in the image rather than of its grey tone. For different study sites within the Los Angeles urbanized area texture measures could be derived which result in characteristic values for specific types of land cover and are largely independent of the azimuth angle effect. At the same time the results for the study area indicate an improvement of the overall separability for the different land cover types included in the analysis.

A81-44515 * # **Measurements of CF2Cl2, CFCl3, and N2O in the lower stratosphere between 2 deg S and 73 deg N latitude.** J. F. Vedder, E. C. Y. Inn, B. J. Tyson, C. A. Boitnott (NASA, Ames Research Center, Atmospheric Experiments Branch, Moffett Field, CA), and D. O'Hara (EAL Corp., Richmond, CA). *Journal of Geophysical Research*, vol. 86, Aug. 20, 1981, p. 7363-7368. 20 refs.

Mixing ratios are presented for CF2Cl2, CFCl3, and N2O in the lower stratosphere. They are derived from measurements made on samples collected by a high-altitude aircraft during a survey in the northern hemisphere in the summer of 1977. The vertical distributions of the mixing ratios of these species show a decrease with increasing altitude and a marked decrease at a given altitude with increasing latitude from 2 deg S to 73 deg N latitude. These results agree with measurements at similar latitudes in the fall of 1976 and with results of other experiments. The experimental apparatus and procedures are described in greater detail than in previous papers.
(Author)

A81-44526 # **Aerosol formation, transformation, and effects in Denver's emissions plume.** C. C. Van Valin, R. F. Pueschel, and D. L. Wellman (NOAA, Environmental Research Laboratories, Boulder, CO). *(International Association of Meteorology and Atmospheric Physics, International Conference on Budget and Cycles of Trace Gases and Aerosols, 4th, Boulder, CO, Aug. 12-18, 1979.) Journal of Geophysical Research*, vol. 86, Aug. 20, 1981, p. 7463-7470. 22 refs.

During November and December 1978, a field study was conducted with the primary objective to identify the factors and substances that cause the reduction of visibility and the gray-brown color of the polluted air mass, the 'brown cloud', during winter pollution episodes. Gases and aerosols over the Denver metropolitan area and at varying distances downwind were measured with a research aircraft. Near the principal emissions source area, the particle number distribution was found to be dominated by nucleus mode aerosols, the O3 concentration was much lower than background, and the NO concentration was greater than that of NO2. After a few hours reaction during sunlight, the O3 concentrations were greater than background, most of the NO had been converted to NO2, and the accumulation mode particles were comparatively more numerous than in the young pollution cloud. A mechanism has been identified for the removal of NO2 from the atmosphere during periods of high relative humidity.
G.R.

A81-44684 **Texture analysis and urban land use classification.** C. A. Harlow, R. W. Conners, M. M. Trivedi, D. A. DiRosa, and R. E. Vasquez-Espinosa (Louisiana State University, Baton Rouge, LA). In: SOUTHEASTCON '81; Proceedings of the Region 3 Conference and Exhibit, Huntsville, AL, April 5-8, 1981. Piscataway, NJ, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 115-119. 10 refs.

Image processing techniques have been applied to the analysis of urban scenes. Many characteristics of land use patterns are given by the spatial variations of the gray shades in the image. Texture analysis is an image processing technique developed to analyze spatial variations in gray shades. A texture analysis technique based upon the Spatial Gray Level Dependence Method (SGLDM) has been developed. This method utilizes statistical and structural analysis and is therefore called a statistical and structural texture analysis procedure (SSA). The SSA texture analysis procedure has been applied to the analysis and classification of a digitized photograph of a complex urban scene. (Author)

A81-44701 **A comparison of automatic classification algorithms for land use map by remotely sensed data.** S. Fujimura and H. Toyota (Tokyo, University, Tokyo, Japan). In: SOUTHEASTCON '81; Proceedings of the Region 3 Conference and Exhibit, Huntsville, AL, April 5-8, 1981. Piscataway, NJ, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 299-303.

The results of various supervised classification algorithms for the preparation of land use maps based on remotely sensed multispectral data are compared in order to illustrate some of the problems in the selection of the most suitable algorithm. Multispectral data obtained in the Fukuyama district of Japan was classified by the maximum likelihood method, the linear discriminant function method, the minimum Euclidean distance method and the correlation method with and without normalization of the mean, and the correct classification rates of the various methods were analyzed. The relative accuracies of the methods are found not to be in the order predicted under the assumption of a normal data distribution. Further analysis reveals this to be due to the lack of generality of the training data. It is thus recommended that when the statistical properties of the training data vary greatly from one category to another, the minimum Euclidean distance method or the linear discriminant function method be used rather than the more common maximum likelihood method. A.L.W.

A81-44862 **ISS-b experimental results on global distributions of ionospheric parameters and thunderstorm activity.** N. Matuura (Ministry of Posts and Telecommunications, Radio Research Laboratories, Nakaminato, Ibaraki, Japan), M. Kotaki, S. Miyazaki, E. Sagawa, and I. Iwamoto (Ministry of Posts and Telecommunications, Radio Research Laboratories, Koganei, Tokyo, Japan). *(International Astronautical Federation, International Astronautical Congress, 31st, Tokyo, Japan, Sept. 22-27, 1980.) Acta Astronautica,* vol. 8, May-June 1981, p. 527-548. 19 refs.

Experimental results from the Ionosphere Sounding Satellite-b (ISS-b) are presented, with emphasis on the global distribution of such ionospheric parameters as (1) critical frequency (foF2); (2) the probability of occurrence of spread echoes; (3) nighttime electron temperature and ionic constituents of the ambient plasma; and (4) thunderstorms detected by means of radio technique. Detailed maps are presented for all four missions of the satellite, for a period lasting from August 1978 to June 1979. O.C.

A81-45406 # **Investigation of the efficiency of the optical sounding of aerosol by the use of spectral photometers (Issledovanie effektivnosti opticheskogo zondirovaniia aerozolia s ispol'zovaniem spektral'nykh fotometrov).** B. S. Kostin. In: Investigation of atmospheric aerosol by means of laser sounding.
Novosibirsk, Izdatel'stvo Nauka, 1980, p. 70-83. 12 refs. In Russian.

A method is developed for the analysis of the efficiency of the optical sounding of atmospheric aerosol by spectral photometers; the method is based on the comparison of results obtained from the inversion of optical measurements with data from direct measurements of the microstructure of atmospheric aerosol. This approach makes it possible to compare the absolute values of particle concentrations. It is shown that, within the limits of measurement error, the inversion results agree well with direct-measurement data. F.G.M.

A81-45434 **Land use mapping of Hong Kong from Landsat images - An evaluation.** C. P. Lo (University of Hong Kong, Hong Kong). *International Journal of Remote Sensing,* vol. 2, July-Sept. 1981, p. 231-252. 15 refs.

Landsat 70 mm film images are evaluated for planimetric accuracy and the accuracy of land use interpretation for the production of land use maps of Hong Kong. Maps are produced for a 1061 sq km area at a scale of 1:250,000 using a Fairey additive viewer, and at a scale of 1:88,500 using manual interpretation, demonstrating that information can be improved with further enlargement of the Landsat segment despite resolution limitations. An urban land use map at a scale of 1:25,000 is also generated with a computer assisted method of Landsat data analysis, demonstrating lower accuracy due to the intensity of urban land use. Although the maps do not reach the accuracy of aerial photography, they are of an acceptable planimetric and semantic accuracy, and are relatively cheap while allowing frequent revisions. D.L.G.

A81-45437 **Procedures for change detection using Landsat digital data.** P. J. Howarth (McMaster University, Hamilton, Ontario, Canada) and G. M. Wickware (Environment Canada, Canada Centre for Inland Waters, Burlington, Ontario, Canada). *International Journal of Remote Sensing,* vol. 2, July-Sept. 1981, p. 277-291. 17 refs. Research supported by the Natural Sciences and Engineering Research Council of Canada, Prairie Regional Office of Parks.

Procedures in applying complementary methods of band ratioing and post-classification change detection to monitor a large remote area are presented. Work by Wickware and Howarth (1980) demonstrating the use of band ratioing and post-classification detection is also presented, including methods for detecting, displaying and measuring environment change. Band ratioing, classification, change matrices, binary theme prints and conflict character assignment maps are found to provide a practical sequence for analyzing hydrologic and vegetation changes. In addition, the amount of information required is found to depend on the complexity of the problem and the level and type of resource management decision to be made. D.L.G.

A81-45862 **A differential inversion method for high resolution atmospheric remote sensing.** M. M. Abbas (Drexel University, Philadelphia, PA). In: Remote sensing of atmospheres and oceans; Proceedings of the Interactive Workshop on Interpretation of Remotely Sensed Data, Williamsburg, VA, May 23-25, 1979. New York, Academic Press, Inc., 1980, p. 1-14; Discussion, p. 15-18. 7 refs.

The spectral lines of atmospheric gases may be fully resolved with high resolution observations by techniques, such as infrared heterodyne spectrometers. An inversion method suitable for such observations is discussed and is found to have several advantages over conventional methods. The method is based on matching the derivatives of the observed radiances or transmittances with the calculated values for the modeled atmosphere. The proposed method provides a significant narrowing of the weighting functions and improvement in the overall accuracy of the retrieved profiles. The method is applied to inversion of ozone absorption lines in the earth's atmosphere and the results are compared with those obtained with a conventional method. (Author)

A81-45870 * **Role of multiple scattering in ozone profile retrieval from satellite measurements in the ultraviolet.** S. L. Taylor, P. K. Bhartia, V. G. Kaveeshwar, K. F. Klenk (Systems and Applied Sciences Corp., Riverdale, MD), A. J. Fleig (NASA, Goddard Space Flight Center, Greenbelt, MD), and C. L. Mateer (Department of the Environment, Atmospheric Environment Service, Downsview, Ontario, Canada). In: Remote sensing of atmospheres and oceans; Proceedings of the Interactive Workshop on Interpretation of Remotely Sensed Data, Williamsburg, VA, May 23-25, 1979. New York, Academic Press, Inc., 1980, p. 219-229; Discussion, p. 230, 231. 6 refs.

The retrieval of the ozone profile from satellite ultraviolet measurements can be extended to greater depths when multiple scattering is taken into account. The sensitivity of the multiple-scattered wavelength radiances to geophysical variables are discussed and results of profile inversions of Nimbus 4 backscatter ultraviolet data for coincident ground-truth measurements with and without multiple scattering are presented. (Author)

A81-46044 **The use of CIR and airborne multispectral scanner techniques for wetland soils mapping of highway corridors.** A. E. Redfield (Dames and Moore, Washington, DC) and K. S. Thom (General Electric Co., Space Div., Lanham, MD). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980.
New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 205-213. 9 refs. Research sponsored by the U.S. Department of Transportation.

This paper summarizes the results of an investigation aimed at evaluating the potential advantages of state-of-the-art airborne remote sensing for highway siting and planning tasks, specifically in wetland areas. The basic objectives of the study were to develop methodologies using remotely sensed data for mapping wetlands soils and drainage, to evaluate the relative merits and usefulness of the various methods developed, to generate a selection of output products from the remote sensor data for display to highway planners and photointerpreters, and to provide recommendations for implementation of remote sensing techniques in the highway planning and siting process. To accomplish these objectives, remote sensor and ground truth data were acquired for selected test sites in Florida, Michigan, and Minnesota. One of several test sites in Michigan has been selected as representative of the study objectives and methodology. (Author)

A81-46046 **The methodology of CIAT's land resource study of tropical America.** T. T. Cochrane (International Centre for Tropical Agriculture, Cali, Columbia). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 227-234. 23 refs.

A description is given of an agricultural land resource evaluation program aimed at the effective development and transfer of germplasma-oriented technology to Central and South America. The study reduces land information to a common base in terms of land systems that are defined as repetitive patterns of climate, soils and landscape, delineated directly onto satellite and side-looking radar imagery. The system facilitates the analysis of the land resource data with other information, including economic parameters, and is playing an increasingly important role as a dynamic land resource data bank for the region's crop, pasture and agro-forestry production. O.C.

A81-46407 * **Analysis of landfills with historic airphotos.** T. L. Erb, W. R. Philipson, W. L. Teng, and T. Liang (Cornell University, Ithaca, NY). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Sept. 1981, p. 1363-1369. Research supported by the New York State Dept. of Health; Grant No. NGL-33-010-071.

An investigation is conducted regarding the value of existing aerial photographs for waste management, including landfill monitoring. The value of historic aerial photographs for documenting landfill boundaries is shown in a graph in which the expansion of an active landfill is traced over a 40-year period. Historic aerial photographs can also be analyzed to obtain general or detailed land-use and land-cover information. In addition, the photographs provide information regarding other elements of the physical environment, including geology, soils, and surface and subsurface drainage. The value of historic photos is discussed, taking into account applications for inventory, assessing contamination/health hazards, planning corrective measures, planning waste collection and facilities, developing inactive landfills, and research concerning improved land-filling operations. G.R.

A81-47001 **Radiation studies in the atmosphere (Radiatsionnye issledovaniia v atmosfere).** Edited by K. Ia. Kondrat'ev and N. E. Ter-Markariants. Leningrad, Gidrometeoizdat (Glavnaia Geofizicheskaia Observatoriia, Trudy, No. 434), 1980. 151 p. In Russian.

Attention is given to such topics as the basic problems of the physics and chemistry of contemporary changes of climate, the Global Aerosol-Radiation Experiment (GAREX) of 1977, determination of effective values of the refractive index of atmospheric aerosol, algorithms for the effective evaluation of atmospheric transparence from lidar sounding, and angular anisotropy of reflection from snow cover and desert. Also considered are a method for the aerial measurement of integral fluxes of long-wave and short-wave radiation, statistical characteristics of the albedo of the earth-atmosphere system over the Atlantic, the effect of diffraction on the accuracy of absolute measurements of direct solar radiation, and an evaluation of the presence of aerosol in the atmosphere over the tropical Atlantic from measurements of direct solar radiation. F.G.M.

A81-47002 # **Basic problems of the physics and chemistry of contemporary changes of climate (Osnovnye problemy fiziki i khimii sovremennykh izmenenii klimata).** K. Ia. Kondrat'ev. In: Radiation studies in the atmosphere. Leningrad, Gidrometeoizdat, 1980, p. 3-14. 26 refs. In Russian.

The paper reviews various problems of the physics and chemistry of contemporary changes of global climate, associated with the influence of changes of atmospheric composition on radiation conditions and climate. Particular attention is given to the analysis of anthropogenic changes in the greenhouse effect. The possibilities of investigating climate parameters and the factors determining climate by means of space observations are briefly examined. F.G.M.

A81-47359 **An atmospheric study by 'Spectrum-15' onboard of the Salyut-6 orbital station.** D. Mishev (B'lgarska Akademiia na Naukite, Tsentralna Laboratoriia po Kosmicheski Izsledvaniia, Sofia, Bulgaria). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome Italy, Sept. 6-12, 1981, Paper 81-120.* 10 p. 8 refs.

The multichannel spectrometer system, Spectrum-15, on board the Salyut-6 orbital station, is used to investigate the air pollution over large cities and industrial centers. The Spectrum-15 instrument has 15 channels, each bandwidth of which is not greater than 20 nm. It uses an objective width focus distance of 300 mm, a relative aperture of 1:4, and an angle-of-sight of 8 deg. The instrument is used in several study programs to define atmospheric transparency, determine aerosol indices of atmospheric scatter, and study the dependence of frequency on the atmospheric transfer function. The preliminary data processing of results from these investigations are presented in graphic form and interpreted. A list of the various program investigations carried out thus far is given, along with their corresponding dates and orbits as well as the cosmonaut who performed the study. J.F.

A81-47430 **Potential for detection of natural disasters via Meteosat.** A. Robson, J. Morgan (ESA, European Space Operations Centre, Darmstadt, West Germany), R. W. Herschy (Department of Transport/Department of the Environment, Water Data Unit, Reading, England), and J. Zschau (Kiel, Neue Universität, Kiel, West Germany). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-262.* 19 p. 11 refs.

The use of Meteosat satellite capabilities in the detection of natural disasters is discussed. The satellites, which are positioned in geosynchronous orbit above the prime meridian, carry on imaging radiometer with coverage of a 65 deg great circle arc about the subsatellite point in one visible and two infrared channels every half hour. Disasters which may be observed by the radiometer system include hurricanes, extratropical depressions, drought situations and flooding; the resulting ground-processed images may then be distributed by the satellite to over 200 digital and analog receiving stations to be used in ameliorating the effects of the disasters. The Meteosat satellites are also part of a data collection system in which environmental sensors known as data collection platforms transmit data to the satellite on one of 66 reporting channels in the 402 MHz band and the satellite retransmits the data to the ground following conversion to the 1675 MHz band. The data collection platforms can be used to gather data in real time for purposes of water management and for applications in earth motion studies such as storm surge prediction and earthquake prediction. A.L.W.

A81-47433 **Analysis of the November 23, 1980 earthquake as a design basis for satellite emergency communication.** G. Berretta (ESA, Paris, France), P. Daly, H. Fromm, D. Tits (ESA, European Space Research and Technology Centre, Noordwijk, Netherlands), and S. Rossignoli (Fabbrica Italiana Apparecchiature Radioelettriche, Milan, Italy). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-269.* 23 p. 12 refs.

The earthquake that occurred in Italy in November 1980 is discussed in order to show how satellites can be used for communication during emergencies. Five functions are identified where human intervention could reduce the consequences of earthquakes; these are predicting the occurrence of the earthquake, locating the earthquake focus, evaluating the damage and identifying life lines, localizing the survivors in need, and providing communications. Satellites are shown to be applicable in all these functions. It is proposed that a

Direct Television Broadcasting satellite be used for emergency communication. The features offered by this satellite are listed, among them the fact that the communications link to the area of the disaster is immediately available and that no installation with specialized personnel is required. It is also noted that the TV receiving antenna that would be used for emergency communication is already pointed toward the satellite. C.R.

A81-48682 # **Dynamic ecosystem of the Aral Basin studied from satellite imagery (Dinamika ekosistem basseina Arala po materialam kosmofotos'emok).** A. V. Sadov (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Gidrogeologii i Inzhenernoi Geologii, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 18-26. 12 refs. In Russian.

The possibilities and methods of studying changes in the environment of the Aral Basin and adjacent territories based on an analysis of satellite imagery are presented. The analysis is carried out by means of ecological interpretations, including the identification of the spatial boundaries of the ecosystem, an estimation of their stability to technogenetic effects, and the determination of their resulting changes. Satellite imagery is shown to be valuable for the construction of prognosis maps: an economic assessment of the territories involved is made and the probable lines of development of the anthropogenic process are plotted; this is used to construct prognosis maps of the evolution of the territory. J.F.

A81-49174 **Satellite observations of England and northwestern Europe.** J. L. Foster, J. P. Ormsby, and R. J. Gurney. *Weather,* vol. 36, Sept. 1981, p. 252-259. 8 refs.

The Heat Capacity Mapping Mission (HCMM) satellite, launched in April 1978 into a sun-synchronous orbit at an altitude of 620 km, acquired high-quality thermal infrared data suitable for studying the thermal properties of the terrestrial surface. HCMM data taken over England, Wales, and northwestern Europe on May 30, 1978 illustrate the effect of large urban areas on the weather and climate of the area. The urban heat island effect is evident, the larger cities being 10 K hotter than surrounding areas in the early afternoon. Many of the urban areas appear as dark areas of lower albedo, and well defined heat islands show as white blotches due to the higher surface temperature. The heat islands are much more distinct on the daytime thermal infrared images than on the nighttime images. Areas having a low building density and little or no industry are also detected on HCMM daytime thermal infrared imagery, since even a single block of buildings can start the process of heat island formation (Landsberg, 1970). Central business areas of London and the West Midlands are about 8 K warmer than their surrounding rural areas, but there is some systematic variation within each urban area, corresponding to local land use. J.F.

A81-49346 **Determination of beach sand parameters using remotely sensed aircraft reflectance data.** R. A. Shuchman (Michigan, Environmental Research Institute, Ann Arbor, MI) and D. K. Rea (Michigan, University, Ann Arbor, MI). *Remote Sensing of Environment,* vol. 11, Sept. 1981, p. 295-310. 16 refs. Research supported by the University of Michigan; Contracts No. N0014-74-C-0273; No. N0014-78-C-0458.

A81-49407 # **The distribution of the trace gases H2O, NO2, and HNO3 in the middle atmosphere on the basis of LIMS measurements (Über die Verteilung der Spurengase H2O, NO2 und HNO3 in der mittleren Atmosphäre aus LIMS-Messungen).** H. Fischer, C. Lüdecke (München, Universität, Munich, West Germany), and J. C. Gille (National Center for Atmospheric Research, Boulder, CO). *(Deutsche Meteorologen-Tagung und Internationales Alfred-Wegener-Symposium, Berlin, West Germany, Feb. 25-29, 1980.) Annalen der Meteorologie,* no. 15, 1980, p. 29-32. 7 refs. In German.

The trace gases H2O, NO2, and HNO3 are important factors in the photochemical reactions of the stratosphere. The Limb Infrared Monitor of the Stratosphere (LIMS) experiment was started to obtain global data for a detailed study of the chemistry-radiation-dynamics system of the atmosphere, taking into account the atmospheric region extending from the upper troposphere to the lower mesosphere. The LIMS instrument was placed on board of the polar Satellite Nimbus 7. A horizon-scanning procedure is employed in the studies. The current status of data evaluation is considered, giving attention to comparisons with ground truth data and the computer program for the evaluation of the satellite data. The obtained profiles for H2O, HNO3, and NO2 are shown. G.R.

A81-49431 # **Aerosol sounding by means of aircraft-borne optical radar (Aerosolsondierung mittels Flugzeuglidar).** P. Mörl, M. E. Reinhardt, and W. Renger (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Physik der Atmosphäre, Oberpfaffenhofen, West Germany). *(Deutsche Meteorologen-Tagung und Internationales Alfred-Wegener-Symposium, Berlin, West Germany, Feb. 25-29, 1980.) Annalen der Meteorologie,* no. 15, 1980, p. 167, 168. 5 refs. In German.

Optical radar measurements conducted with the aid of aircraft provide the possibility to perform rapid surveys on a regional scale regarding the existence and location of atmospheric haze. Typical applications are related to the study of smog layers, and the survey of solid-particle pollutant emission in the case of great industrial complexes. Studies conducted by the German Meteorological Service make use of a Nd-YAG laser which provides 20-ns pulses at 1.064 and 0.532 micrometers. Operational data concerning the optical radar system are discussed, taking into account the backscattering profile produced by the laser pulse. Attention is also given to the auxiliary equipment, and aspects of data processing and evaluation. First results related to pilot missions are briefly considered. G.R.

A81-49433 # **Comparative measurements of stratospheric CH4 and CO concentrations with spectrograph and correlation radiometers (Vergleichende Messungen stratosphärischer CH4- und CO-Konzentrationen mit Spektrograph und Korrelationsradiometern).** D. Rabus and F. Fergg (München, Universität, Munich, West Germany). *(Deutsche Meteorologen-Tagung und Internationales Alfred-Wegener-Symposium, Berlin, West Germany, Feb. 25-29, 1980.) Annalen der Meteorologie,* no. 15, 1980, p. 171, 172. 5 refs. In German.

A81-49752 # **The integration of remote sensing in environmental decision making for the Maritimes.** A. C. Hamilton (New Brunswick, University, Fredericton, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 1-7.

An examination of the integration of remote sensing in decision-making for the Maritime environment shows that for basic land and ocean information the requirement is for sensors such as SAR that will reveal properties that hitherto were elusive or undetectable. For operational monitoring, the main requirement in addition to what is now routinely available is for dependable, frequent, weather-independent imagery. For management and policy decision-making there is an institutional requirement and a technical requirement. The institutional requirement is for better facilities to convert data to information and for decision-makers to learn the use of information interactively. The technical requirement is for finer and more dependable spectral resolution particularly for forestry, agriculture, and land classification. B.J.

A81-49759 # **Multistage remote sensing in exploratory ecodistrict land classification.** E. B. Wiken, T. W. Pierce, and G. R. Ironside (Environment Canada, Lands Directorate, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 63-71. 5 refs.

The Northern Land Use Information Series attempts to provide broad and consistent coverage of land resources in the Northwest Territories at a scale of 1:250,000. The map series includes an ecological overview of terrestrial ecosystems, the focus being the mapping and description of ecodistricts. The combined use of Landsat, aerial photographs, and 35 mm color slides has proved to be effective in the prefield, field, and postfield activities of the ecological land classification. The benefits have included improved map boundary definition and ecodistrict descriptions; reduced time, material, and manpower inputs; and improved field reconnaissance work through better direction to the various ecodistricts as well as to representative locales within each district. B.J.

A81-49773 # **Interpreter evaluations of airborne radar imagery for ecological and land/use cover classification in southern Manitoba.** C. D. A. Rubec (Environment Canada, Lands Directorate, Ottawa, Canada) and J. Cihlar (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings.
Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 203-215. 6 refs.

Synthetic aperture radar images flown over two test areas in southwestern Manitoba were used successfully for classification and mapping of land cover, land use and general vegetation types. The criteria affecting interpretation success are similar to those commonly used with aerial photography. Radar images have specific patterns, shapes and associations that can be related to ground features. However, radar image tone and texture can present problems to interpreters. Experience with other types of images, and personal knowledge of the study area, all increase interpreter success with radar images. Summer X band, HH polarized images are the optimal source of synthetic aperture radar data for ecological and land use mapping applications in prairie regions of Canada. (Author)

A81-49781 # **Applications of remote sensing to construction impact assessment at the Roberts Bank Port, British Columbia.** G. F. Tomlins and K. P. B. Thomson (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings.
Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 289-299. 18 refs.

A81-49783 # **Land use/cover mapping for Halifax County - Remote sensing alternatives.** N. A. Prout (Intera Environmental Consultants, Ltd., Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 307-320. 12 refs.

A81-49788 # **Interpretation techniques applied to mixed terrains (Techniques d'interprétation appliquées aux terrains mixtes).** E. J. Langham (Environment Canada, National Hydrology Research Institute, Hull, Quebec, Canada), Y. Heymann (Société Française des Etudes et de La Recherche Economique et Statistique, France), and A. I. Rivard. In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings.
Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 361-367. In French.

Results of the application of the supervised classification technique in conjunction with image color enhancement to land-use classification based on Landsat data obtained over a region previously studied by aerial photography and ground observations are presented. Data was obtained of the French department of Lot, a region composed of woods, pasture land, agricultural fields and vineyards. Due to the smallness of the fields and the mixture of vine and ground spectral signatures in a single area, it was found that nonsupervised classification of false-color images was unable to provide more than a general classification of land use. When principle component color enhancement is used together with the supervised classifier, it was possible not only to identify calcareous underbrush and other types of wooded terrains, but to distinguish vineyards from other crops. A.L.W.

A81-49790 # **Spectral measurement of rangeland.** K. P. B. Thomson, F. J. Ahern, R. J. Brown, K. Staenz (Canada Centre for Remote Sensing, Ottawa, Canada), D. H. McCartney, and J. Waddington (Department of Agriculture, Melfort, Saskatchewan, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 377-386. 6 refs.

A project carried out by the Canada Centre for Remote Sensing during the summer of 1979 at the Experimental Rangeland Site near Pathlow, Saskatchewan in which the biomass/spectral reflectance relationship was addressed is discussed. It is noted that this site is representative of the rangeland under current use in Saskatchewan. The remote sensing data comprised Landsat MSS data (July 27 and September 19) and airborne multispectral scanner data (July 27 and September 14). Analysis of the data was found to show good correlations between Landsat MSS parameters and green biomass in the July period but not in September. Similar results were obtained for the Thematic Mapper Bands, which were simulated from the airborne MSS data. C.R.

A81-49792 # **Remote sensing and land use planning.** P. S. T. Lee (U.S. Department of Agriculture, Remote Sensing Branch, Washington, DC). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings.
Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 397-403. 8 refs.

Changes in land use were measured in Central Arizona using sensing techniques, and a framework was developed to provide timely information on land use planning purposes. A land use classification system is presented, which defines major land use categories as agricultural land; urban or build-up land; range, forest and barren land; and water. Landsat data are registered and digitized to estimate acreages of changes for various land use classes. Total acreages or urban land have increased from 136 thousand acres in 1972, to 304 thousand acres in 1979, representing a 122% increase; 65% of which comes from range and other land, and 35% of which comes from formerly agricultural land. About 55,000 acres of rangeland have been converted to farmland due to more water irrigation; however, this does not offset the loss of agricultural land to urban expansion, and a net loss of 15,000 acres of farmland and 186,000 acres of rangeland is found in Maricopa county. D.L.G.

A81-49798 # **Landsat data as a basis for regional environmental assessment within the Columbia Plateau.** L. S. Leonhart (Rockwell International Corp., Richland, WA) and J. G. Stephan (Battelle Pacific Northwest Laboratories, Richland, WA). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 459-471.

It is pointed out that initial assessments of the area involved classification of four contiguous Landsat scenes recorded during the summer of 1975 and about 300 1978 high-altitude (U-2) photographs. The mosaic thus obtained was segregated into ten land-cover classes. The classified land-cover data were machine-integrated with digital irrigation well-location data obtained from the U.S. Geological Survey's Ground-Water Site Inventory. The resulting ground-water multisource data product was required by hydrologists in order to segregate potential artificial recharge areas from artificial groundwater discharge areas. It is noted that related studies have employed Landsat data and aerial imagery to identify linear structures and other geologic features which may have a significant bearing on the tectonic and/or hydrologic setting to the Columbia Plateau. C.R.

A81-49803 # **Resource inventory and terrain analysis in north western Manitoba from integrated remote sensing data.** V. H. Singhroy (J. D. Mollard and Associates, Ltd., Regine, Saskatchewan, Canada) and R. Dixon (Manitoba Remote Sensing Centre, Winnipeg, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 513-523. 10 refs.

It is noted that continued growth in northern Manitoba communities demands the acquisition and compilation of data pertaining to the regional resource potential of large areas. In the majority of cases, planners, resource managers, and environmental consultants are faced with the problem of limited and scattered data which inhibit comprehensive regional planning. A simple integrated approach and techniques involved in using multistage remote sensing data in the production of a regional resource base map are demonstrated. Enhanced Landsat data, black and white, color infrared and thermal infrared photographs are used to generate regional vegetation and terrain geology maps prior to field investigation. Field sampling verifies the accuracy of the units identified and produces a valuable data base for detailed analysis and planning. C.R.

A81-49806 # **Current resource mapping and environmental monitoring applications using Landsat MSS data in Scotland.** G. C. Stove (MacAuley Institute for Soil Research, Aberdeen, Scotland) and K. E. Bagot (Royal Aircraft Establishment, Farnborough, Hants., England). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 551-557.

Photogrammetric digital mapping facilities and the advanced, IDP3000 image analyzer are used to enhance and measure a variety of peatland and land cover types, leading to the compilation of a 1:100,000-scale Peat Resource and Land Cover Map of the Isle of Lewis. Further development of multispectral classification techniques based on stretched band ratios for selective terrain features has resulted in the compilation of a land use/land cover map of the Buchan area of northeast Scotland. In addition, optimizing the stretched band intensity differences by means of principal components analysis has made it possible to distinguish between phytoplankton blooms, coastal sediment re-circulation patterns and submerged coastal and river-mouth bars. A similar enhancement technique outlines mountain snow cover and distinguishes between cloud and snow. O.C.

N81-29496*# National Aeronautics and Space Administration. Earth Resources Labs., Bay St. Louis, Miss.
EVALUATION OF MULTIBAND, MULTITEMPORAL, AND TRANSFORMED LANDSAT MSS DATA FOR LAND COVER AREA ESTIMATION
E. R. Stoner, G. A. May (Dept. of Agriculture, Houston, Tex.), and M. T. Kalcic, Principal Investigators Apr. 1981 25 p refs
Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Proj. AgRISTARS)
(E81-10161; NASA-TM-82289; DC-Y1-04089; NSTL/ERL-196) Avail: NTIS HC A02/MF A01 CSCL 02C

Sample segments of ground-verified land cover data collected in conjunction with the USDA/ESS June Enumerative Survey were merged with LANDSAT data and served as a focus for unsupervised spectral class development and accuracy assessment. Multitemporal data sets were created from single-date LANDSAT MSS acquisitions from a nominal scene covering an eleven-county area in north central Missouri. Classification accuracies for the four land cover types predominant in the test site showed significant improvement in going from unitemporal to multitemporal data sets. Transformed LANDSAT data sets did not significantly improve classification accuracies. Regression estimators yielded mixed results for different land covers. Misregistration of two LANDSAT data sets by as much and one half pixels did not significantly alter overall classification accuracies. Existing algorithms for scene-to scene overlay proved adequate for multitemporal data analysis as long as statistical class development and accuracy assessment were restricted to field interior pixels. REMOTE SENSING OF SOIL RADIONUCLIDE FLUXES IN A TROPICAL ECOSYSTEM
B. Clegg, J. Koranda, W. Robinson, and G. Holladay 6 Nov. 1980 7 p refs Submitted for publication
(Contract W-7405-eng-48)
(UCRL-84501) Avail: NTIS HC A02/MF A01

A transponding geostationary satellite is being used to collect surface environmental data to describe the fate of soil-borne radionuclides. The remote, former atomic testing grounds at the Eniwetok and Bikini Atolls present a difficult environment in which to collect continuous field data. Land-based, solar-powered microprocessor and environmental data systems remotely acquire measurements of net and total solar radiation, rain, humidity, temperature, and soil-water potentials. For the past year, the water flux model predicts wet season plant transpiration rates nearly equal to the 6 to 7 mm/d evaporation pan rate, which decreases to 2 to 3 mm/d for the dry season. Radioisotopic analysis confirms the microclimate-estimated 1:3 to 1:20 soil to plant dry matter concentration ratio. This ratio exacerbates the dose to man from intake of food plants. Nephelometer measurements of airborne particulates presently indicate a minimum respiratory radiological dose. DOE

ATMOSPHERIC NITRIC ACID AND CHLOROFLUOROMETHANE 11 FROM INTERFEROMETRIC SPECTRA OBTAINED AT THE OBSERVATOIRE DU PIC DU MIDI
C. Lippens and C. Muller 1980 31 p refs Submitted for publication
(Aeronomica-Acta-A-227-1980) Avail: Issuing Activity

A modified interferometer was used to obtain absorption spectra and emission spectra (reduced from the difference between the reference spectrum and transformed emission data). The data obtained lead to a value of 12 billion mol/cu cm nitric acid at an altitude of 22km; chlorofluoromethane 11 is found in the troposphere at 148 + or - 12ppt. No evidence of peroxy nitric acid, nitrous acid or ammonia was observed. The difficulties in observing hydrogen peroxide and obtaining accurate values for ozone and chlorofluoromethane 12 are discussed. The integrated peroxynitric acid column is found to be smaller than 10 to the 15th power mol/sq cm. Author (ESA)

ENVIRONMENTAL MEASUREMENTS OF POWER PLANT COOLING TOWER AND STACK PLUMES Final Report
D. W. Thomson, ed., R. G. dePena, ed., and J. A. Pena, ed. 1981 180 p refs
(Contracts DE-AS02-76EV-02463; AT(11-1)-2463; E(11-1)-2463)
(DOE/EV-02463/6) Avail: NTIS HC A09/MF A01

The focus of this program was to establish the reality and magnitude of any environmental changes caused by the plumes from large evaporative cooling towers through a comprehensive set of measurements taken from a research aircraft. Results are divided into three sections: structure and dynamics of cooling tower plumes; chemical transformation of SO2 to sulfates in coal-fired power plant plumes; and drift deposition studies. SATELLITE MEASUREMENTS OF TROPOSPHERIC AEROSOLS Final Report
M. Griggs Aug. 1981 64 p refs
(NASA-CR-3459; SAI-131-80-578-LJ) Avail: NTIS HC A04/MF A01 CSCL 13B

This investigation uses LANDSAT 2 radiance data and ground-truth measurements of the aerosol optical thickness, obtained previously from five inland sites, to study the usefulness and limitations of the near infrared radiance over inland bodies of water. The linear relationship between LANDSAT 2 MSS7 and aerosol content found in this study can be used to estimate the aerosol content with a standard deviation of 0.42N. Analysis of the data for MSS6 and MSS7 suggest that the larger uncertainty is mostly due to water turbidity, with little contribution from the adjacency effect. The relationship found is best applied to determine an average aerosol content over a period of time at a given target, or an area average at a given time over several targets close together. Author

REMOTE SENSING FOR ENGINEERING SITE SELECTION
Jack N. Rinker and Robert E. Frost 13 May 1981 15 p refs
(AD-A102810; ETL-R018) Avail: NTIS HC A02/MF A01 CSCL 14/5

For any significant construction, e.g., airstrip, bridge, dam, powerplant, industrial park, canal, etc., there is the first phase of site selection and evaluation. One goal of this phase is to obtain information about surficial materials (granular, cohesive, permeable, nonuniform, etc.), thickness of the soil mantle, nature of the bedrock, drainage, presence of unstable materials and conditions, presence of subsurface solution cavities, fractures, joints, faults, etc. Remote sensing techniques in the form of manual analysis of photo index sheets and LANDSAT for regional information, and of stereo aerial photography for local details.

provides an economical and rapid means of obtaining this first assessment. An experienced team can quickly produce surficial geology/soils maps, drainage maps, land use/land cover maps, etc., highlight potential problem areas, select preferred sites and alternates, and indicate probable impacts on the environment of any given action. This image-derived information sets the basis for establishing a logical ground sampling program, and provides the framework for correlating a large variety of information. As yet, it is not possible to provide very much of this needed terrain information by digital, or automatic, image analysis procedures.

A field experiment designed to further understand the formation and transport of visibility reducing aerosols and to characterize regional scale air masses and urban plumes is described. Measurements were made primarily in the Ohio River Valley region. The NASA participation included obtaining measurements for the determination of mixing layer height and ozone profiles by using airborne remote sensor systems such as the ultraviolet differential absorption lidar, the high spectral resolution lidar, and the laser absorption spectrometer. Other NASA systems included the microwave atmospheric remote sensor, tethered balloons, an in situ measurements aircraft, and several photometer/transmissiometer systems. T.M.

GEODESY AND CARTOGRAPHY

Includes mapping and topography.

A81-42554 # Analysis of the geometry of a frame photograph (K analizu geometrii kadrovogo fotosnimka). V. G. Tarakanov (Leningradskoe Vysshee Voenno-Topograficheskoe Komandnoe Uchilishche, Leningrad, USSR). *Geodeziia i Aerofotos'emka,* vol. 1, 1981, p. 82-86. In Russian.

A principle of surface mapping is developed for describing the basic geometric relationships of frame photographs. In particular, the principle can be used to obtain relationships between the coordinate points of a region and image coordinate points on aerial photographs in addition to scale formulas for aerial photographs. The proposed mapping principle (and methods for the description of single photos and stereopairs that derive from this principle) is characterized by relative simplicity, universality, and efficiency. B.J.

A81-42556 # The use of spaceborne photography for topographic mapping (Ispol'zovanie kosmicheskikh snimkov pri topograficheskom kartografirovanii). T. V. Vereshchaka (Moskovskii Institut Inzhenerov Geodezii, Aerofotos'emki i Kartografii, Moscow, USSR). *Geodeziia i Aerofotos'emka,* vol. 1, 1981, p. 95-102. In Russian.

Various aspects of the application of spaceborne photography to topographic mapping are considered. Spaceborne photography is found to be useful in such tasks as the systematic analysis of terrain changes, the interpretation of aerial photographs for the compilation and modification of topographic maps, and the editing of topographic maps. Spaceborne photography is also considered in relation to the formation of systems of conditional markings, and the geographic principles underlying combinations of conditional markings. B.J.

A81-42846 # Measurement of lengths, angles, and areas on the earth's spheroid (Izmerenie dlin, uglov i ploshchadei na zemnom sferoide). V. I. Khizhnichenko. *Geodeziia i Kartografiia,* May 1981, p. 6-8. In Russian.

In order to evaluate geometrical distortions of images obtained by satellite television systems, it is necessary to know the lengths, areas, and angles of triangles specified by three points on the surfaces of the spheroidal earth. This paper presents approximate formulas for calculating the lengths, angles, and areas of spheroidal triangles, whose vertices are specified by geographic coordinates. The analysis is carried out relative to auxiliary angular coordinates on a single sphere; the resulting formulas are obtained with allowance for the ellipsoidality of the spheroid. This method was successfully used to evaluate geometrical distortions of images of the earth's surface obtained by the Meteor-Priroda space system. B.J.

A81-42847 # Topographic and cartographic applications of photogrammetry (O topograficheskom i kartograficheskom primenenii fotogrammetrii). N. V. Sukhot'ko. *Geodeziia i Kartografiia,* May 1981, p. 52-55. In Russian.

Papers concerning the topographic and cartographic applications of photogrammetry presented at the 16th congress of the International Photogrammetry Society (July 1980) are briefly reviewed. Particular consideration is given to the compilation of detailed digital maps and the cartographic processing of digital data; the improvement and refinement of topographic maps; general large-scale mapping with the aim of urban and rural planning; mapping using satellite remote sensing systems; orthophototransformation and photomapping; pollution mapping; and the general mapping of earth resources. Basic directions in the development of photogrammetry are described. P.T.H.

A81-43524 # Gravimetric studies of the earth's crust in the oceans (Gravimetricheskie issledovaniia zemnoi kory okeanov). A. G. Gainanov. Moscow, Izdatel'stvo Moskovskogo Universiteta, 1980. 240 p. 271 refs. In Russian.

Methods of marine gravimetry are described, and maps of the gravity anomalies in the Pacific, Atlantic, and Indian Oceans are presented and described. Gravimetric and seismic data were used to construct density models of the oceanic crust, as well as of the lithosphere of mid-oceanic ridges, trenches, and continental margins. In addition, the use of gravimetry to survey for petroleum resources in the ocean is considered. B.J.

A81-45427 * An examination of spectral band ratioing to reduce the topographic effect on remotely sensed data. B. Holben and C. Justice (NASA, Goddard Space Flight Center, Earth Resources Branch, Greenbelt, MD). *International Journal of Remote Sensing,* vol. 2, Apr.-June 1981, p. 115-133. 33 refs.

Spectral-band ratioing of radiance data is examined as a means of reducing the topographic effect in multispectral data. A ground-based nadir-pointing two-channel radiometer filtered for the red and photographic IR portions of the spectrum was used to measure the topographic effect associated with a uniform surface inclined from horizontal to 60 deg at 16 compass points and for several solar elevations. It is found that ratioing reduced the topographic effect in the field-measured radiance data by an average of 83%, that the remaining topographic effect could be further reduced by subtracting the scattered-light component of the global irradiance before ratioing, and that ratioing was not effective in reducing the topographic effect on shaded surfaces illuminated solely by scattered light. It is concluded that additional variations in ratios can be expected for Landsat data owing to sensor calibration and quantization. F.G.M.

A81-45828 * # Orbit determination requirements for TOPEX. B. D. Tapley, B. E. Schutz, J. Ries, G. Rosborough (Texas, University, Austin, TX), and G. H. Born (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *American Astronautical Society and American Institute of Aeronautics and Astronautics, Astrodynamics Specialist Conference, Lake Tahoe, NV, Aug. 3-5, 1981, AAS Paper 81-158.* 30 p. 15 refs.

The error sensitivity of orbit calculations in support of the NASA Ocean Surface Topography Mapping Experiment (TOPEX), which require an accuracy on the order of 5 cm, is investigated. The contributions of errors in the gravitational, atmospheric drag and solar radiation pressure models to the computed orbit are analyzed for the cases of an ideal data distribution and realistic laser ranging data coverage. It is found that the major contributor to radial orbital error is the error in the geopotential model, accounting for orbital errors of 30 to 70 cm, with the effects of solar radiation pressure, drag modeling, tracking station coordinate errors making lesser contributions. It is concluded that TOPEX accuracy goals cannot be met using ground-based laser ranging data without improving the geopotential model. A.L.W.

A81-46678 Stereoorthophotos as aids in the mapping of high mountain regions (Stereoorthophotos als Hilfsmittel der Hochgebirgskartierung). R. Finsterwalder (München, Technische Universität, Munich, West Germany). *Bildmessung und Luftbildwesen,* vol. 49, Sept. 1, 1981, p. 161-164. 7 refs. In German.

The appropriate representation of the characteristics of high mountain regions is very difficult. Contour lines, for instance, cannot adequately show sharp edges and discontinuities present in mountainous terrain. The difficulties can be reduced by making use of orthophotos. Finsterwalder (1972) and Pillewizer (1976) have conducted studies in this direction, taking into account orthophotos which could not be viewed stereoscopically. However, the third dimension is in mountainous areas especially important for the interpretation of aerial photographs. The use of a second orthophoto makes it now possible to view orthophotos also stereoscopically, and to obtain, thereby, additional information for the map-plotting procedure. Attention is given to the production of stereoorthophotos, the study of the two orthophotos and the contour line image in the stereoscope, and the drawing procedure. The implementation of the considered method is illustrated with the aid of three examples involving stereo models. G.R.

A81-47938 # Differential Doppler experiment /DIDEX/ for geodetic applications. J. Kazmierski (Instytut Lotnictwa, Warsaw, Poland), J. Latka, and J. B. Zielinski (Polska Akademia Nauk, Centrum Badan Kosmicznych, Warsaw, Poland). In: Scientific and engineering uses of satellite radio beacons; Proceedings of the

Symposium, Warsaw, Poland, May 19-23, 1980. (A81-47901 23-46) Warsaw, Panstwowe Wydawnictwo Naukowe, 1981, p. 443-448.

The proposed DIDEX (Differential Doppler Experiment) of the Intercosmos program uses a mother spacecraft and two subsatellites to measure the Doppler shift of a two-way microwave radio signal. The space vehicles have an altitude of about 300 km and an orbital plane inclination of 85 deg. The two-way Doppler shift is measured by transmitting a known signal to the two subsatellites from the mother spacecraft and coherently transponding the observed signal back to the reference system. The reference oscillator generates a 10 MHz signal stable to one part in 10 to the 11th over a 1-100 sec interval. The receivers are of the phase-locked type; the phase-locked loops have 5 Hz noise bandwidths which are broadened to 50 Hz during signal acquisition. An accuracy of 0.05 mm/sec for velocity measurements is required, and a signal frequency of 3-5 GHz is used. The influence of the ionosphere on measurement accuracy is considered when (1) the mother spacecraft moves in a homogeneous ionosphere with a velocity difference between the two subsatellites and (2) the mother satellite moves in an ionosphere with a horizontal gradient electron concentration. The DIDEX procedure is shown to correct measurement errors, taking into account only the first term containing the influence of the ionosphere. J.F.

A81-48678 # **Optimization of Doppler measurements in the satellite network of Eastern Europe (Optimizatsiia Dopplerovskikh izmerenii v kosmicheskoi seti Vostochnoi Evropy).** Ts. Gergov and N. Georgiev (B'lgarska Akademiia na Naukite, Tsentralna Laboratoriia po Vissha Geodeziia, Sofia, Bulgaria). *Vissha Geodeziia,* no. 7, 1981, p. 13-19. 5 refs. In Russian.

Photographic observations and optimal Doppler observations from the Intercosmos program were used in a modeling study to determine the feasibility of constructing a three-dimensional geodetic network. Optimal Doppler measurements were assessed in an effort to obtain the highest accuracy in the determination of station coordinates. It is found that a three-dimensional network of satisfactory geodetic accuracy cannot be established on the basis of only Doppler measurements of earth chord length. Network accuracy is increased by the inclusion of the orienting elements Lambda and Phi of the earth chords, defined by available photographic observations in conjunction with Doppler measurements. B.J.

A81-48679 # **A 'meteorological' method for calculating vertical refraction (O 'meteorologicheskom' metode ucheta vertikal'noi refraktsii).** O. A. Mozzhukhin (Gor'kovskii Inzhenerno-Stroitel'nyi Institut, Gorki, USSR). *Vissha Geodeziia,* no. 7, 1981, p. 57-63. 8 refs. In Russian.

Attention is given to the so-called meteorological method for assessing the influence of refraction in geodetic leveling. The theoretical background and experimental verification of the method are discussed along with its limits of application. Empirical ratios of systematic and random errors due to refraction are obtained for geodetic measurements as a function of distances to the observation points. B.J.

A81-48696 # **Lineaments - Problems and directions of studies by means of aerial and space tools and methods (Lineamenty - Problemy i napravleniia issledovanii s pomoshch'iu aerokosmicheskikh sredstv i metodov).** V. I. Makarov. *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 109-115. 35 refs. In Russian.

Divergences of opinion existing among investigators of lineaments are examined. Problems involving the definition, origin, age, classification, and depth of lineaments, and their relationship to planetary fracture systems are examined. Emphasis is placed on the use of remote sensing methods to study lineaments. B.J.

A81-49811 # **Generation and use of digital elevation data for large areas.** P. J. Letts (DIPIX Systems, Ltd., Ottawa, Canada) and G. Rochon (Université Laval, Quebec, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 597-602.

It is noted that while the integration of topographical data in the analysis of remotely sensed images has several advantages, technical difficulties often make this operation impracticable. On the basis of contours digitized from standard cartographic maps, a new approach to the generation of a digital terrain model is presented, along with the use of these data in the transformations of satellite-measured radiances. It is thus possible to modify the radiances either as a function of the ground solar illumination or of the look angles of the satellite, or even of the reflection characteristics of the observed surfaces. SPACE BASED TOPOGRAPHIC MAPPING EXPERIMENT USING SEASAT SYNTHETIC APERTURE RADAR AND LANDSAT 3 RETURN BEAM VIDICON IMAGERY Final Report
Gerald L. Mader 20 Jul. 1981 35 p refs Prepared for JPL
(Contract JPL-955998)
(NASA-CR-164675; JPL-9950582) Avail: NTIS HC A03/MF A01 CSCL 08B

A technique for producing topographic information is described which is based on same side/same time viewing using a dissimilar combination of radar imagery and photographic images. Common geographic areas viewed from similar space reference locations produce scene elevation displacements in opposite direction and proper use of this characteristic can yield the perspective information necessary for determination of base to height ratios. These base to height ratios can in turn be used to produce a topographic map. A test area covering the Harrisburg, Pennsylvania region was observed by synthetic aperture radar on the Seasat satellite and by return beam vidicon on by the LANDSAT - 3 satellite. The techniques developed for the scaling re-orientation and common registration of the two images are presented along with the topographic determination data. Topographic determination based exclusively on the images content is compared to the map information which is used as a performance calibration base. A.R.H.

SEASAT SATELLITE INVESTIGATION OF THE STRUCTURE OF WESTERN NEBRASKA AND ITS APPLICATION TO THE EVALUATION OF GEOTHERMAL RESOURCES
J. Stix 1981 20 p refs Presented at the Intern. Symp. of Remote Sensing of Environ., Ann Arbor, Mich., 11-15 May 1981
(Contract W-7405-eng-36)
(LA-UR-81-1454; CONF-810557-1) Avail: NTIS HC A02/MF A01

Seasat synthetic aperture radar (SAR) satellite imagery was used to interpret the structural framework and the geothermal potential of an area in western Nebraska. Lineaments were mapped from the imagery and then compared to known structure. It was found that Seasat does record surface manifestations of subtle basement structures, particularly faulting. Four areas with geothermal potential were delineated using Seasat and other data. It is concluded that Seasat imagery is a useful reconnaissance exploration tool in the interpretation of regional structure within areas of little topographic relief. DOE

SATELLITE TO SATELLITE DOPPLER TRACKING (SSDT) FOR MAPPING OF THE EARTH'S GRAVITY FIELD Final Report, 1 Apr. 1980 - 31 Mar. 1981
G. Colombo, E. M. Gaposchkin, and M. Grossi Sep. 1981 107 p refs
(Grant NAG5-36)
(NASA-CR-164722) Avail: NTIS HF A06/MF A01 CSCL 08G

Two SSDT schemes were evaluated: a standard, low-low, SSDT configuration, which both satellites are in basically the same low altitude nearly circular orbit and the pair is characterized by small angular separation; and a more general configuration in which the two satellites are in arbitrary orbits, so that different configurations can be comparatively analyed. The standard low-low SSDT configuration is capable of recovering 1 deg X 1 deg surface anomalies with a strength as low as 1 milligal, located on the projected satellite path, when observing from a height as large as 300 km. The Colombo scheme provides an important complement of SSDT observations, inasmuch as it is sensitive to radial velocity components, while keeping at the same performance level both measuring sensitivity and measurement resolution. TERRAIN PROFILING FROM SEASAT ALTIMETRY
R. L. Brooks Mar. 1981 59 p refs Sponsored by NASA, National Geodetic Survey and USGS
(NASA-CR-156878) Avail: NTIS HC A03/MF A01 CSCL 08B

To determine their applicability for terrain profiling, Seasat altimeter measurements were analyzed for the following geographic areas: (1) Andean salars of southern Bolivia; (2) Alaska; (3) south-central Arizona; (4) imperial Valley of California; (5) Yuma Valley of Arizona; and (6) Great Salt Lake Desert. Analysis of the data over all of these geographic areas shows that the satellite altimeter servo did not respond quickly enough to changing terrainn features. However, it is demonstrated that retracking of the archived surface return waveforms yields surface elevations over smooth terrain accurate to + or - 1 m when correlated with large scale maps. The retracking algorithm used and its verification over the salars of southern Bolivia are described. Results are presented for each of the six geographic areas. A.R.H.

(AD-A103378; AFIT/GCS/EE/80-14) Avail: NTIS HC A06/MF A01 CSCL 09/2

This report has its basis in the Airborne Electronic Terrain Mapping System (AETMS), an aircraft mapping system based on an idea proposed by L.A. Tamburino and developed by the Air Force Avionics Laboratory. A constantly changing background provides the basis for an interesting investigation on the hypothesis that a dynamic background will distract the operator's attention away from important details on the display. The software developed provides an overlay of symbols onto the terrain map generated by the AETMS and is contained in this report. A symbol and color set is suggested for the AETMS. An experiment to determine a master symbol and color set is suggested. The experiment suggests using both simple vector symbols and Fourier transformed symbols to help define the master set. MILITARY GEODESY AND GEOSPACE SCIENCE, UNIT ONE
Warren G. Heller and A. Richard LeSchack Feb. 1981 191 p refs
(Contract F19628-77-C-0152; AF Proj. 3204)
(AD-A104038; SCIENTIFIC-5; AFGL-TR-81-0028) Avail: NTIS HC A09/MF A01 CSCL 08/5

Unit One introduces the student to Mapping, Charting, and Geodesy. Basic concepts and principles are presented that will be applied during the remainder of the course. The subjects to be covered include: Earth modeling; Coordinate systems; and Techniques of mapping, charting, and geodesy. All of these areas are part of the science of geodesy, which is defined by the three principal subjects with which it is concerned: The size and shape of the earth; The relative location of points on or near the surface of the earth; and The earth's gravity field. The first two areas are referred to as geometric geodesy; the third is physical geodesy. The geometric and physical (or gravitational) aspects of geodesy are closely related to one another, since the physical surface of the earth does not deviate greatly from an equipotential surface of the gravity field. The material of Unit One is organized into three chapters, each examining geodesy from a different point of view: Geometric geodesy (Chapter Two) -- including material on relevant aspects of cartography and surveying; Physical geodesy (Chapter Three); and Satellite geodesy (Chapter Four) -- emphasizing the unique contributions to geodesy resulting from the use of Earth satellites. TOPOGRAPHIC SLOPE CORRECTION FOR ANALYSIS OF THERMAL INFRARED IMAGES Interim Report

Kenneth Watson Mar. 1981 14 p refs
(Contract NASA Order-S-40256-B)
(PB81-211781; USGS-GD-81-002) Avail: NTIS HC A02/MF A01 CSCL 08B

A simple topographic slope correction was developed using a linearized thermal model and assuming slopes less than about twenty degrees. The correction can be used to analyze individual thermal images or composite products such as temperature difference or thermal inertia. Simple curves are provided for latitudes of 30 and 50 degrees. The form is easily adapted for analysis of HCMM images using the Defense Mapping Agency digital terrain data. GRA

GULF OF MEXICO SATELLITE RADAR ALTIMETRY Final Report

C. G. Parra, R. G. Forsythe, and C. L. Parsons Aug. 1981 231 p refs
(NASA-TM-73295) Avail: NTIS HC A11/MF A01 CSCL 08C

The dynamic topography of the sea surface was measured. The radar altimeter measurements yield average ocean topographic data which are mapped. Seasonal deviations from a 3 year mean topography are presented. The altimeters are also instrumented with sample and hold gates which provide information about the shape and amplitude of the return waveform. Parameters including ocean surface wind speed and the significant wave height are determined. One hundred eighty six wind speed and significant wave height histograms are presented. E.A.K.

GEOLOGY AND MINERAL RESOURCES

Includes mineral deposits, petroleum deposits, spectral properties of rocks, geological exploration, and lithology.

A81-41908 **Tiwi geothermal project - The Philippines.** R. Aquino (De La Salle University, Manila, Philippines), S. Aquino (Philippine National Oil Co., Manila, Philippines), and A. Alcaraz. In: Geothermal energy projects: Planning and management. New York and Oxford, Pergamon Press, 1980, p. 168-205. 5 refs.

An account is given of the Philippines' Tiwi geothermal field development and related research projects. Among the topics covered are: (1) preliminary research studies throughout the Philippine archipelago, considering such potential sites as direct volcanic exhalations, shallow volcanic sources, deep-seated plutonic sources, and deep faulting in regions of high geothermal gradient; (2) fault systems detected by aerial photographic surveys, such as the plug-dome fault systems, radial fault systems, and arcuate fault systems; (3) performance figures on test drill holes at six different locations; (4) mechanical details of the Tiwi steam-gathering system; (5) the National Power Corporation's organization of responsibilities; and (6) detailed comparisons of energy demand, sources and their costs in the Philippines as seen by the Ten-Year Energy Program for the period 1979-88. O.C.

A81-42276 # **The use of imagery of the earth to study the structure of degassing zones within oil and gas basins (Ispol'zovanie kosmicheskikh snimkov zemli pri izuchenii stroeniia zon degazatsii neftegazonosnykh basseinov).** G. I. Amurskii and M. S. Bondureva (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Prirodnykh Gazov, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 5-10. 6 refs. In Russian.

Space imagery is used to identify and trace the local faults and fracture zones of several anticlinal structures in Central Asia. These zones, favorable to the vertical migration of stratified fluids, exhibit an increased permeability, and are therefore subject to degassing and the accumulation of gaseous sulfur. J.F.

A81-42277 # **Concerning the hydrogeological significance of faults on platform regions, as revealed by space imagery (O gidrogeologicheskoi roli razryvnykh narushenii platformennykh oblastei, vyiavliaemykh na kosmicheskikh snimkakh).** M. I. Burleshin and A. V. Sadov (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Gidrogeologii i Inzhenernoi Geologii, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 11-17. 9 refs. In Russian.

The characteristics of faults revealed by space imagery are compared with those observed by traditional methods. A hydrogeological interpretation of several faults in the Turanian plate is given, along with the fundamental methods of this interpretation. It is concluded that space imagery may be used to recognize developing faults which would influence the thickness, composition, and plicated structure of the platform rock. Space imagery may also reveal areas of extended rock overlap, influencing rock permeability, and may thus be used to find underground mineral water. Finally, space imagery is important for the accurate definition of hydrogeological region boundaries and the development and revision of hydrogeological maps. J.F.

A81-42278 # **Ring structures of Precambrian shields, based on the interpretation of space imagery (Kol'tsevye struktury Dokembriiskikh shchitov po dannym deshifrirovaniia kosmicheskikh snimkov).** V. M. Moralev (Akademiia Nauk SSSR, Institut Litosfery, Moscow, USSR) and M. Z. Glukhovskii (Proizvodstvennoe Geologicheskoe Ob'edinenie Aerologiia, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 18-22. 5 refs. In Russian.

Space imagery interpretations were used to identify two types of ring structures found in Precambrian shields. Large ring structures, reaching a diameter of 900-1200 km, are considered relicts of ancient sedimentary-volcanic basins, corresponding to structures of primary lithospheric cleavage. The second type of ring structures, having a 50-400 km diameter, mainly represent granite-gneiss domes and magmatic diapirs, surrounded by zones of ultrabasite-basic granulite. J.F.

A81-42279 # **Fitoexomorphogenic analysis of geological environment changes in the South Aral Sea, based on aerial and space imagery (Fitoekzomorfogennyi analiz izmenenii geologicheskoi sredy Iuzhnogo Priaral'ia po aero- i kosmicheskim snimkam).** A. L. Revzon (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Gidrogeologii i Inzhenernoi Geologii, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 23-27. 6 refs. In Russian.

A81-42280 # **Space research on seismic regions (Kosmicheskie issledovaniia v seismoaktivnykh regionakh).** B. N. Khovanskii (Gosudarstvennyi Nauchno-Issledovatel'skii i Proizvodstvennyi Tsentr Priroda, USSR). *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 28-34. 10 refs. In Russian.

Space images have been used to identify fracture zones of high seismic and tectonic activity, where a relatively high percentage of seismic dislocations and earthquake epicenters are located. The combination of space imagery interpretation with the analysis of foreshock data, obtained by geodetic and geophysical methods, is shown to provide an accurate means of long range prediction of earthquake time, location, and intensity. J.F.

A81-42289 # **Geological interpretation in an interactive mode in automated systems of digital image processing (Geologicheskoe deshifrirovanie v dialogovom rezhime v avtomatizirovannykh sistemakh tsifrovoi obrabotki izobrazhenii).** T. P. Belikova, V. E. Gendler, and L. P. Iaroslavskii (Akademiia Nauk SSSR, Institut Problem Peredachi Informatsii; Proizvodstvennoe Geologicheskoe Ob'edinenie Aerologiia, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 102-112. 6 refs. In Russian.

The geological interpretation of aerial and space images in automated systems is discussed. Examples are presented using the method of adaptive amplitude transformation for image preparation in interactive mode processing. Brightness characteristics of geological objects and the peculiarities of their interpretation during space photography are discussed. Regions of plicated land masses, formed by Ordovician deposition, are shown at several levels, using the adaptive mode quantization method, and corresponding geological maps are presented with explanations of their symbols. The method of contrast-degree intensification is discussed, whereby the original phototone values are transformed on the basis of a distribution curve of tonal image points. Interactive processing of aerial and space images is shown to dramatically increase the number of objects distinguished, as well as to improve the reliability of the interpretation. J.F.

A81-43215 **Optical and digital analyses of Landsat data depicting hydrogeological features of the Daryacheh-Ye-Namak area, Iran.** M. S. Akhavi (Nova Scotia Land Survey Institute, Lawrencetown, Canada). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 278-283. 13 refs.

Optical and digital processing techniques were used to detect and map hydrogeological and water resources features at the Daryacheh-Ye-Namak (salt lake) area, north-central Iran. Analyses of optically and digitally enhanced Landsat images, aided by field information, made it possible to depict the changing areal extent and depth of a shallow salt lake occurring in the western section of this internal lacustrine basin. Also, salt surfaces having possible economic value were classified and other pertinent hydrogeologic observations were made using enhanced Landsat data. (Author)

A81-43227 **Correlation of geologic structure inferred from computer enhanced Landsat imagery with underground water supplies in Arizona.** R. Schowengerdt, C. E. Glass (Arizona, University, Tucson, AZ), L. Ethridge (Phillips Petroleum Co., Bartlesville, OK), and E. M. Babcock. In: Satellite hydrology; Proceedings of the Fifth

Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 387-397. 12 refs. U.S. Department of the Interior Grant No. B-066-ARIZ.

Photolineaments of the entire northeast quadrant of Arizona were mapped from standard EROS Data Center false color Landsat composites. Photolineaments were also mapped using computer-enhanced Landsat imagery of two intensive study sites. A third source of geological-structure data was existing large-scale lineament maps derived from aerial photography of the study sites. A spatially distributed parameter obtained from these maps, lineament density, was mathematically correlated with water well survey data (specific capacity, specific conductance, transmissivity, and water temperature) to establish the most useful combination of data for extension of lineament signatures through the entire northeast quadrant. Results from this initial study indicate that Landsat imagery may be used to survey large areas for lineaments, and to cue the hydrogeologist to promising regions, which can then be mapped at aerial photography scales. B.J.

A81-43228 **Landsat data for locating shallow glacial aquifers in eastern South Dakota.** P. H. Rahn (South Dakota School of Mines and Technology, Rapid City, SD) and D. G. Moore (South Dakota State University, Brookings, SD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 398-406. 11 refs. U.S. Geological Survey Contract No. 14-08-0001-13576.

A81-43230 **Ground water exploration programs in Africa.** L. Zall and O. Russell (Earth Satellite Corp., Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Fall, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 416-425. 12 refs.

As part of regional ground water exploration programs in Tanzania, Upper Volta, Benin, and Ghana, ground water exploration guide maps were prepared using digitally processed and photographically enlarged Landsat imagery. Digital processing of Landsat data permits the enhancement of spectral gray levels or subtle tonal variations, such as those caused by lithologic changes, geological structure, or the variation of soil moisture. Such imagery also emphasizes linear features, fractures, or faults that can be missing or difficult to interpret from unprocessed imagery. These guide maps substantially increased the efficiency of operation and decreased the time and expense necessary to complete these programs. B.J.

A81-43232 **Applications of aerospace data for detection of submarine springs in Jamaica.** F. A. Kohout (U.S. Geological Survey, Woods Hole, MA), D. R. Wiesnet (NOAA, National Earth Satellite Service, Washington, DC), M. Deutsch, J. A. Shanton (U.S. Geological Survey, Reston, VA), and M. C. Kolipinski (U.S. National Park Service, San Francisco, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.

Minneapolis, MN, American Water Resources Association, 1981, p. 437-445. 8 refs. Research sponsored by the United Nations.

A project carried out in Jamaica in 1971 by the United Nations Development Programme, the Jamaica Geological Survey, and NASA is discussed. The findings of the underwater SCUBA investigations are correlated with anomalies shown in the aircraft data and with Apollo IX spacecraft photography and TIROS-N satellite imagery. Remote sensing of submarine springs is seen as having the potential of performing at least two useful functions: (1) the discovery of submarine discharge may help to identify geologic or geomorphic structures on the mainland where there would be high probability of drilling successful wells, and (2) periodic observation of the thermal or turbidity anomalies associated with a submarine spring can serve as an outpost system for monitoring hydrologic changes brought about by future expolitation of the aquifer. C.R.

A81-43730 * **Use of imaging radar for geology and archeology.** M. Daily (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. DA-1-B-1 to DA-1-B-13.

Imaging radar is shown to be a useful sensor for geological analysis as a standal one sensor in clouded regions or as a complementary data source with visible NIR systems. Radar image tone is a function of the radar system parameters (imaging geometry, frequency, polarization) and a function of the target (local slope, electrical properties, and surface roughness). Substantial topographic texture enhancement can be achieved for large scale features by using specular returns associated with steep-incidence radars or shadows associated with grazing-incidence systems. Texture enhancement also allows radar to image lineaments and archeological features, such as canals and causeways. Future multispectral radars may achieve better discrimination of subresolution structures. Seasat radar images of several geographic locations are provided. J.F.

A81-44061 # **The possibility of using an aerial thermal survey for studying the structure of the salt bed in the Gulf of Kara-Bogaz-Gol (O vozmozhnosti primeneniia teplovoi aeros'emki dlia izucheniia stroeniia solianogo plasta Zaliva Kara-Bogaz-Gol).** V. I. Gornyi (Vsesoiuznoe Aerogeologicheskoe Nauchno-Proizvodstvennoe Ob'edinenie Aerogeologiia, Leningrad, USSR). *Akademiia Nauk SSSR, Doklady,* vol. 259, no. 2, 1981, p. 321-323. 5 refs. In Russian.

A81-45430 * **A radar image time series.** F. Leberl, H. Fuchs (Graz, Technische Universität, Graz, Austria), and J. P. Ford (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *International Journal of Remote Sensing,* vol. 2, Apr.-June 1981, p. 155-183. 13 refs. Contract No. NAS7-100.

A set of ten side-looking radar images of a mining area in Arizona that were aquired over a period of 14 yr are studied to demonstrate the photogrammetric differential-rectification technique applied to radar images and to examine changes that occurred in the area over time. Five of the images are rectified by using ground control points and a digital height model taken from a map. Residual coordinate errors in ground control are reduced from several hundred meters in all cases to + or - 19 to 70 m. The contents of the radar images are compared with a Landsat image and with aerial photographs. Effects of radar system parameters on radar images are briefly reviewed. F.G.M.

A81-46039 **Lineament mapping in northern Sweden from Landsat images using orthogonal image transforms.** L. C. Andersson and H. Hauska (Lulea, Hogskola, Lulea, Sweden). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980.
New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 147-157. Styrelsen for Teknisk Utveckling Contracts No. 76-6669; No. 77-6345.

A81-46194 **Geomorphic mapping from Landsat-3 Return Beam Vidicon /RBV/ imagery.** G. R. Cochrane and G. H. Browne (Auckland, University, Auckland, New Zealand). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Aug. 1981, p. 1205-1213. 17 refs.

Landsat-3 Return Beam Vidicon (RBV) imagery of eastern North Island of New Zealand is useful for regional geomorphic mapping. Three broad tectono-physiographic regions - Western Taupo volcanic plateau zone, Central blockfaulted Mesozoic greywacke zone, and Eastern Inland Hawke Bay zone of dissected Tertiary hill country - are recognized and their features discussed. Some previously unmapped lineaments are noted. Ten geomorphic categories - coastal dunes, raised marine terraces, alluvial terraces, volcanic cones, dip slopes, large landslides, undissected plateau, dissected plateau, undulating hill country, and steep hill country - have been successfully mapped from the RBV data. The principal advantages of RBV images for geomorphic mapping are their improved geometric accuracy and their relatively high spatial resolution (40 m). Limitations in differentiating land-water interfaces are present. Landsat RBV imagery can be used to supplement future studies in the earth sciences, especially in remote or poorly mapped areas. (Author)

A81-47353 **Ore-controlling space geological objects and their assessment techniques applied to mineral prediction.** A. L. Stavtsev (Ministerstvo Geologii SSSR, Ob'edinenie Aerogelogiia, Moscow, USSR). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-107.* 4 p.

The importance of rupture dislocations is assessed, and it is noted that faults and fault zones are commonly well exhibited on space images. The combined analysis of fault identification charts and maps of the distribution of known mineral deposits makes it possible to assess the role of rupture dislocations in the spatial distribution of minerals and to delineate, through analogy, promising areas for mineral extraction. Attention is also given to the analysis of the ore-controlling importance of ring structures and to the combined application of identified space images and geological and geophysical data to a computerized mineral prediction. It is concluded that the application of space images to mineral exploration provides geologists with ample opportunity for studying the spatial distribution of metallic and nonmetallic ores and predicting their potential occurrences. C.R.

A81-48683 # **The informational estimation of the effectiveness of using satellite imagery in hydrogeological research (Opyt informatsionnoi otsenki effektivnosti primeneniia kosmicheskikh snimkov v gidrogeologicheskikh issledovaniiakh).** M. I. Burleshin and V. N. Koloskova (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Gidrogeologii i Inzhenernoi Geologii, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 27-31. 6 refs. In Russian.

An informational approach is used to estimate the effectiveness of using satellite imagery in the hydrogeological mapping of the Ustiurt Plateau. Satellite imagery and intermediate and final schemes of the hydrogeological interpretation are represented as data channels. Based on information theory, a quantitative estimation and a comparison of the contents of hydrogeological maps, compiled by terrestrial mapping and space imagery interpretation, are made. J.F.

A81-48684 # **The use of satellite imagery for studying the structural features of the Caspian oil and gas region (Primenenie kosmicheskikh materialov dlia izucheniia strukturnykh osobennostei pri-Kaspiiskoi neftegazonosnoi provintsii).** L. F. Volchegurskii and V. G. Pronin (Vsesoiuznoe Aerogeologicheskoe Nauchno-Proizvodstvennoe Ob'edinenie Aerogeologiia, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 32-38. 8 refs. In Russian.

Based on a study of satellite imagery, the boundaries of the Caspian oil and gas region are defined, and the linear structures, interpreted as faults or zones of faults, are distinguished. Ring structures, corresponding to the structures of the different horizons of the sedimentary cover and bedplate, are discussed. Based on the data obtained by satellite imagery, a detailed scheme of the oil and gas geological regionalization is presented. Such a study is then used to define the individual oil and gas zones within the range of the Caspian region, to trace the extended faults which play a significant role in forming these oil and gas zones, to select regions of seismic research, and to reinterpret the structural maps. J.F.

A81-48685 # **The interrelation of linear and isometric objects on satellite imagery and the oil and gas structures of the Buzuluk Basin (O vzaimosviazi lineinykh i izometrichnykh ob'ektov na kosmicheskikh snimkakh i neftegazonosnykh struktur Buzulukskoi vpadiny).** D. M. Trofimov and B. I. Dmitrieva (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 39-44. 5 refs. In Russian.

A81-48690 # **Complex processing of satellite images and the geological interpretation (Kompleksnaia obrabotka kosmicheskikh snimkov i geologicheskaia interpretatsiia).** V. S. Iudin (Akademiia Nauk SSSR, Institut Geologii i Geofiziki, Novosibirsk, USSR). *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 70-75. 20 refs. In Russian.

A correlation between the appearance of natural formations in geological and geophysical measurements and their representation on satellite images is established, based on the data of standard survey regions. The contents of the images, subjected to computer processing, can provide much information on geological processes. A comprehensive analysis using the indicated correlated dependences is used to produce a preliminary classification of tectonic structures and can reveal several phenomena of deep-seated processes in the regions. The obtained results may be used to find valuable mineral deposits. J.F.

A81-48691 # **Interactive system for the regional prognosis of raw mineral resources, based on ground-based and satellite imagery data (Dialogovaia sistema regional'nogo prognozirovaniia mineral'no-syr'evykh resursov po dannym nazemnykh i kosmicheskikh s'emok).** B. A. Chumachenko, V. V. Marchenko, E. P. Vlasov, E. A. Nemirovskii, and V. A. Iakovlev (Mezhdunarodnyi Nauchno-Issledovatel'skii Institut Problem Upravleniia, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 76-82. 5 refs. In Russian.

The interactive system 'Region' is used for forecasting potential areas of raw mineral resources from ground and space survey data. Mathematical models which forecast and estimate the prospective ore content and heuristic models concerning the regularity of ore location are stored in one data bank. Data of aerospace, ground-based, geological, geophysical, and geochemical images as well as their descriptions are kept in a second regional bank. Data from both banks are processed by a logical-statistical program. An algorithm for distinguishing images with standard patterns is performed, and a program for the classification of nonstandard patterns is carried out, based on a taxonomy method. Algorithmic programs of simulated modeling are then performed, producing a variety of prognosis solutions. J.F.

A81-49767 # **Experimental use of real time SAR imagery in support of oil exploration in the Beaufort Sea.** J. B. Mercer (Dome Petroleum, Ltd., Calgary, Alberta, Canada), R. T. Lowry, and S. K. Leving (Intera Environmental Consultants, Ltd., Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 143-152. 8 refs. Research supported by Dome Petroleum, Ltd.

SAR imagery, generated in real-time, has been used for the first time to support an Arctic marine operation. During the latter portion of Dome Petroleum's late season drilling program (November 1979) in the Beaufort Sea, the SAR-580 flew daily missions to provide near real-time 'snap shots' of the ice conditions in the vicinity of the operations. The aim of the program was to assist both the icebreaker support of the drillship and the subsequent navigation back to harbor. To provide the context for this SAR application, a review of Beaufort Sea ice conditions is presented along with a brief discussion of the problems and techniques of the interpretation of the SAR imagery. The downlink and operational performance of the SAR are described along with an outline of an improved system. B.J.

A81-49769 # **Applicability of airborne SAR data to geological mapping.** S. Pala, R. Mussakonski, and E. Wedler (Ministry of Natural Resources, Ontario Center for Remote Sensing, Toronto, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 169-177.

Airborne SAR data, obtained over the Canadian Shield in the vicinity of Sudbury and Haliburton, is analyzed to establish its usefulness and its limitations as a geological mapping tool. Various inherent geological features in volcanic, igneous and metamorphic rock groups are examined on the radar imagery in an effort to determine what can and cannot be detected. An attempt has been made to recognize all the known geological features on the SAR imagery. The characteristics of radar data from X and L bands, both parallel and cross-polarized, were individually studied for the purpose of identifying the usefulness of each band. Successful use of SAR imagery as a geological mapping tool will depend upon the attributes and limitations of the data to distinguish those surface elements necessary for mapping. The techniques used and the results obtained are described. The radar and terrain characteristics which were useful, or which created limitations, are examined and discussed.
B.J.

A81-49802 # **Geological and terrain analysis of the Annapolis County region of Nova Scotia - An application of digital Landsat, radar and colour infrared data.** V. H. Singhroy (J. D. Mollard and Associates, Ltd., Regina, Saskatchewan, Canada), W. D. Bruce (Canada Centre for Remote Sensing, Ottawa, Canada), and G. R.

Stevens (Acadia University, Wolfville, Nova Scotia, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 501-511. 15 refs.

It is pointed out that in areas where detailed geological information is lacking and rock outcrops are covered by thick glacial drift, a comprehensive exploration program must involve both field geologists and remote sensing scientists. The contribution of remotely sensed data to the understanding of the structural and glacial geology of the Annapolis County region where exploration programs are active is assessed. Optical and digital processing of Landsat data, together with visual interpretation of radar and color imagery, are found to be valuable in delineating significant geological features. It is noted that multidate digital Landsat data have contributed to the delineation of glacial lineaments, major faults, and 'convectional cells'. Also discussed is the contribution of color infrared data in the verification of digital Landsat themes. C.R.

A81-49809 # **Detection of changes in a coal surface mining area by ratioing multidate Landsat digital data.** D. O. Ohlen (Technicolor Graphic Services, Inc., Sioux Falls, SD). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 581, 582.

Two procedures are compared for determining change in a coal surface mining area in southern Montana using ratioed multidate Landsat data. Subscenes of Landsat band 5 multispectral scanner data acquired in July 1976 and June 1977 are selected. Each subscene is geometrically corrected to a U.S. Geological Survey 7.5 minute topographic map based and resampled using a 100-meter square pixel. The first procedure used in determining the ranges of ratioed data associated with land cover change involves a comparison of a line printer output of pixel values of the ratioed data with the actual changes that occurred in land cover. The second procedure involves interactive manipulation of the minimum and maximum brightness values in a histogram of the ratioed data to determine which pixels become brighter or darker during the test period. Although the two procedures produce similar results, neither procedure gives results adequate for identifying changes produced by surface mining. C.R.

Forty two domestic investigators affiliated with U.S. universities, governmental agencies, or private concerns and 14 investigators from France, West Germany, the Netherlands, Switzerland, Spain, Sweden, Australia, New Zealand, Venezuela, and Canada were selected to use precise geodetic data obtained by laser ranging and very long base interferometry in a study of the Earth's tectonic plate movement, crustal deformation, and rotational dynamics. The studies to be made and the principal investigators for each are listed. A.R.H.

METHODS DEVELOPMENT AND APPLICATIONS EVALUATIONS OF NURE AERIAL RECONNAISSANCE SURVEY DATA FOR URANIUM RESOURCE EVALUATION: BEEVILLE/BAY CITY AND CRYSTAL CITY QUADRANGLES, TEXAS Final Report
John A. S. Adams, Sam F. Harrill, and J. E. Oddo Apr. 1981 115 p refs Prepared for Bendix Field Engineering Corp., Grand Junction, Colo.
(Contracts DE-AC08-76NV-01183; DE-AC13-76GJ-01664) (GJBX-69(81)) Avail: NTIS HC A06/MF A01

The NURE open-file reports on the aerial gamma spectrometric, hydrologic, and stream-sediment surveys of some 50,000 square kilometers of land area in south Texas were studied in regard to their utility in identifying regions of high or higher favorability for uranium deposits. Substantial agreement was found between the NURE aerial data and the ground and helicopter data as regards the general radioelement distributions in the stratigraphic units studied. The vehicle-mounted gamma-ray spectrometer used systematically gave some 30 percent higher thorium concentration estimates when compared with those from the NURE aerial data. The NURE aerial data are adequate in number to characterize the major stratigraphic units, but they may not be quantitative enough for detailed comparisons from one quadrangle to another, and the optimum sampling area for each formation is not known. ATMOSPHERIC CORRECTION TO LANDSAT DATA FOR LIMONITE DISCRIMINATION Ph.D. Thesis
William Stephen Kowalik 1981 400 p
Avail: Univ. Microfilms Order No. 8115805

A simple equation describing the radiance measured by the LANDSAT satellites over Lambertian surfaces was used to model the effects of the additive path-radiance and skylight irradiance terms when band ratios are used. The model results show that if the path-radiance and skylight are not corrected, than ratio values (longer wavelength in numerator) increase significantly when proceeding from poorly-illuminated to well-illuminated topographic slopes of the same surface material. After a modeled pathradiance correction, this tendency is reduced, for example, in the 5/4 ratio by a factor of 4X across moderately steep topography. LANDSAT data for 183 test sites (pixel size) in the Yerington District, Nevada were studied from each of 6 images to test the conclusions from the modeling in a mineral exploration framework. The 183 test sites represent three major rock types: (1) limonitically-altered Jurassic quartz monzonite: (2) nonlimonitically altered Jurassic granodiorite rocks; and (3) Teritary volcanic rocks. Field and lab work on each site have characterized the rock type, intensity of iron oxide mineral development, surface topographic orientation, percentage vegetation cover, and vegetation species present. Dissert. Abstr.

IDENTIFYING IGNEOUS ROCKS IN AN ARID ENVIRONMENT ON AERIAL PHOTOGRAPHY BY PHOTO TONE AND PHOTO TEXTURE
Judy Ehlen 15 May 1981 26 p refs
(AD-A102809; ETL-R019) Avail: NTIS HC A03/MF A01 CSCL 14/5

Work concerning identifying igneous rock types on aerial photography began in the late 1940's and early 1950's (Belcher, and others, 1951; Frost, and others, 1953). Even now, the only igneous rocks thought by many to be identifiable on aerial photography are granite, basalt, and some pyroclastic rocks (Military Geology, 1956; von Bandat, 1962; Way, 1973; and Lillesand and Kiefer, 1979). Recent work has shown, however, that other specific igneous lithologies, such as andesite and monzonite, can be identified successfully by air photo analysis (Ehlen, 1981). The purpose of this study was to determine how, and to what level of classification, igneous rocks can be identified by air photo interpretation procedures. Thus, the specific objectives were: (1) to further evaluate established igneous rock identification criteria for arid and semiarid environments, (2) to discover new photo pattern indicators for igneous rocks in these climates, and (3) to develop a classification for igneous rocks based on their photo patterns, similar to a petrologic classification. AIRBORNE GAMMA-RAY SPECTROMETER AND MAGNETOMETER SURVEY
1980 78 p
(Contract DE-AC13-79GJ-01692)
(DE81-027157; GJBX-211(81)) Avail: NTIS
HC A05/MF $11.00

An airborne combined radiometric and magnetic survey was performed over the area covered by the Toronto, Buffalo, Kingston, Rochester, and Elmira, 1:250,000 National Topographic Map Series (NTMS), quadrangle maps. The survey was part of DOE's National Uranium Resource Evaluation (NURE) program. Data were collected by a helicopter equipped with a gamma-ray spectrometer with a large crystal volume, and with a high sensitivity proton precession magnetometer. The radiometric system was calibrated at the Walker Field Calibration pads and the Lake Mead Dynamic Test Range. Data quality was ensured during the survey by daily test flights and equipment checks. Radiometric data were corrected for live time, aircraft and equipment background, cosmic background, atmospheric radon, Compton scatter, and altitude dependence. The corrected data were statistically evaluated, plotted, and contoured to produce anomaly maps based on the radiometric response of individual geological units. The anomalies were interpreted and an interpretation map produced. DOE

MINERALOGICAL, OPTICAL, AND GEOCHEMICAL PROPERTIES OF JOHN H. KERR RESERVOIR SEDIMENT SAMPLES FOR AgRISTARS POLLUTION RESEARCH
Karen L. Bice and Stephen C. Clement, Principal Investigators
Aug. 1981 18 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of Interior, and Agency for International Development ERTS
(Contract NAS1-16042; Proj. AgRISTARS)
(E81-10155; NASA-CR-165762) Avail: NTIS
HC A02/MF A01 CSCL 08F

X-ray diffraction and spectroscopy were used to investigate and compare the mineralogical and chemical properties of two Kerr Reservoirs sediment samples. The index of refractions of the kaolinite present in each sample was determined also. The sediments are composed primarily of illite, kaolinite, quartz, and minor amounts of chlorite. The most abundant elements in the sediment samples are silicon, aluminum, and iron. The kaolinite of sample K-10-80 has a higher index of refraction than that of sample K-3-81. Author

(Contract DE-AC13-79GJ-01692)
(DE81-028681; GJBX-240-81-Vol-2-(Salem)) Avail: NTIS
HC A07/MF A01

Five uranium anomalies which meet the minimum statistical requirements are tabulated and are shown on the uranium anomaly interpretation map. Potassium (%K), equivalent uranium (ppM eU), equivalent thorium (eT), eU/eT, eU/K, eT/K, and magnetic pseudo-contour maps are presented. Stacked profiles showing geologic strip maps along each flight-line, together with sensor data, and ancillary data are included. All maps and profiles were prepared on a scale of 1:250,000, but were reduced to 1:500,000 for presentation. Each of the anomalies occurs over the Eocene Tyee and Burpee formation (Teme), a rhythmically banded, feldspathic and micaceous, massive bedded sandstone, and siltstone. Anomalies 1, 2, 3, and 4 are in the northwest corner of the map. Anomalies 2 and 3 are near faults, so may be due to radon leaking from the faults. Anomaly No. 5 is in the southwest corner of the map. DOE

OCEANOGRAPHY AND MARINE RESOURCES

Includes sea-surface temperature, ocean bottom surveying imagery, drift rates, sea ice and icebergs, sea state, fish location.

A81-41350 **Method for estimation of ocean current velocity from satellite images.** E. Mollo-Christensen (MIT, Cambridge, MA), P. Cornillon, and A. D. S. Mascarenhas, Jr. *Science,* vol. 212, May 8, 1981, p. 661, 662. 6 refs. Contracts No. N00014-79-C-0413; No. N00014-75-C-0291.

Barotropic instability waves on a shear interface propagate at the average speed of the water on the two sides. Assuming the instability to be excited by tidal oscillations, the phase speed is the wavelength divided by the tidal period. If the water is at rest on one side of the shear layer the current speed on the other side can be calculated. This method, applied to the Gulf Stream beyond Cape Hatteras as seen in satellite images, gives estimates of current speed in general agreement with in situ observations. (Author)

A81-41490 # **Evaluation of the effect of sea-ice roughness on the microwave emission of the ice (Otsenka vliianiia sherokhovatosti morskogo l'da na ego radioteplovoe izluchenie).** P. A. Nikitin. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 93-97. In Russian.

Formulas of geometric optics are used to calculate the effect of the surface roughness of sea ice on its microwave emission. The ice was modeled as a homogeneous isothermal medium with a normal distribution of elementary-area inclinations. Available data on Arctic sea ice were used as input parameters. It is found that, in the case of horizontal polarization, emissivity increments due to roughness can exceed by 30% the amplitudes of possible variations of the microwave emissivity of Arctic water surfaces. B.J.

A81-41755 **Satellite aided coastal zone monitoring and vessel traffic system.** J. L. Baker (Baker Development Corp., Sherwood Forest, MD). *(Institute of Navigation, Annual Meeting, 36th, U.S. Naval Postgraduate School, Monterey, CA, June 23-26, 1980.) Navigation,* vol. 27, Winter 1980-1981, p. 290-304.

A technique used to continuously monitor the location of cooperating vessels within the 200-nautical-mile U.S. coastal zone is discussed. Using the ATS-3 satellite, the LORAN-C navigational system is based on the 'roll call' technique, and is similar to shore-based ship traffic advisory systems using radar. A description and demonstration of the operational system are given, including the onboard, satellite, communications, display, and control systems. Capabilities of the system include search and rescue, coastal zone management, avoidance of collisions and grounding, ships entering territorial waters, military, and research and exploration. In conclusion, the system is shown to be operational in any weather, relatively inexpensive, able to communicate with all commercial or government satellites, andd possessing unlimited range. D.L.G.

A81-41974 * **Seasat data applications by commercial users.** D. R. Montgomery (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *Marine Geodesy,* vol. 4, no. 4, 1980, p. 387-416. 9 refs. Contract No. NAS7-100.

The Seasat Program was initiated as a proof-of-concept mission to evaluate the effectiveness of a study of remotely sensed oceanographic phenomena from a satellite platform. From its inception the Seasat Program has been user-oriented. The user comprised three major segments of the ocean community, including academic users, users within various government agencies, and commercial users. Commercial users represent a broad spectrum of commercial marine industries. The commercial users proposed to NASA to carry out a pilot demonstration to assess the utility of Seasat data in the private sector. The commercial users' program is considered along with case studies that utilize Seasat data, and aspects of real-time system operation. Attention is given to the potential value of an employment of synthetic aperture radar, the altimeter, the scatterometer, and the scanning multichannel microwave radiometer. G.R.

A81-41996 * **Oceanic Satellite Data Distribution System.** D. R. Montgomery (NASA, Washington, DC). *Marine Technology Society Journal,* vol. 14, no. 6, 1980, p. 28-30.

The Satellite Data Distribution System (SDDS) serves to process satellite-derived ocean observations, generate ocean analysis and forecast products, and distribute the products to a limited set of commercial users. The SDDS functions in series with the U.S. Navy Fleet Numerical Oceanography Center (FNOC) to provide products on a near-real-time basis to commercial marine industries. Conventional meteorological and oceanographic observations provided to FNOC serve as the input set to the numerical analysis and forecast models. Large main-frame computers are used to analyze and forecast products on a routine, operational basis (at 6-hour and 12-hour synoptic times). The products, reformatted to meet commercial users needs, are transferred to a NASA-owned computer for storage and distribution. Access to the information is possible either by a commercial dial-up packet-switching network or by a direct computer-computer connection. J.F.

A81-41997 * **Future plans for NASA's Oceanic Processes Program.** W. S. Wilson (NASA, Office of Space and Terrestrial Applications, Oceanic Processes Branch, Washington, DC). *Marine Technology Society Journal,* vol. 14, no. 6, 1981, p. 26, 27.

NASA's Oceanic Processes Program has the objectives to develop a scientific basis for viewing the oceans from space and to demonstrate the utility of such an undertaking. There are currently four flight projects concerning the oceanic area. These projects are related to the National Oceanic Satellite System (NOSS), the Dynamic Ocean Topography Experiment (TOPEX), the Gravity Satellite (GRAVSAT), and a Synthetic Aperture Radar (SAR) mission. NOSS is being planned as a limited operational demonstration of viewing the oceans from space. It is to provide a capability to observe surface winds, waves, temperature, color, ice cover, and currents. It is scheduled for launch in 1986. TOPEX and GRAVSAT are being planned as research missions and are both scheduled for launch about 1986. The SAR mission is being planned to provide a spaceborne capability to observe the surface of the land and the oceans. G.R.

A81-42026 **Imaging ocean waves by synthetic aperture radars with long integration times.** C. L. Rufenach (NOAA, Wave Propagation Laboratory, Boulder, CO) and W. R. Alpers (Hamburg, Universität; Max-Planck-Institut für Meteorologie, Hamburg, West Germany). *IEEE Transactions on Antennas and Propagation,* vol. AP-29, May 1981, p. 422-428. 25 refs. NOAA-supported research; Grant No. NATO-SRG-10.

The effect of long integration time on synthetic aperture radar imagery of moving ocean waves is examined in view of the fact that Seasat images have resulted in a coherent integration time of 2.5 s (one-look processing) when processed to the full resolution of 6.25 m. First, the orbital motion on image formation is investigated, with results based on a Bessel series expansion of the phase term. Image patterns are evaluated numerically for a monochromatic wave traveling in the azimuthal direction. Then, the effect of the coherence time of the ocean wave field on the azimuthal resolution is examined. It is concluded that the scene coherence time for ocean wave imagery is usually several seconds, and therefore, for most radars and sea states, it is not the limiting factor in the imaging process; the orbital acceleration associated with long waves is usually more important for the degradation in the azimuthal resolution. K.S.

A81-42066 # **A comparison of Seasat 1 altimeter measurements of wave height with measurements made by a pitch-roll buoy.** D. J. Webb (Institute of Oceanographic Sciences, Wormley, Surrey, England). *Journal of Geophysical Research,* vol. 86, July 20, 1981, p. 6394-6398. 13 refs.

Measurements of significant wave-height, made by pitch-roll buoy on eight occasions taken during the Joint Air-Sea Interaction Experiment, were compared with the Seasat 1 radar altimeter measurements. Wave heights were estimated from the leading edge of the smoothed pulse, and the significant wave height was found to be between 0.8 and 2.3 m. The mean value for the ratio of the radar altimeter measurements to the buoy measurements was 0.96 + or - 0.04, and the standard deviation of each value was 0.10. The variance was found to be consistent with the spatial variations in the wave field and other known sources of error, on six occasions, whereas, on two occasions, the variance was found to be larger, thus indicating that some other factor may be involved. K.S.

A81-42067 * # **Microwave radiometer measurement of tidally induced salinity changes off the Georgia coast.** B. M. Kendall (NASA, Langley Research Center, Hampton, VA), and J. O. Blanton (Skidaway Institute of Oceanography, Savannah, GA). *Journal of Geophysical Research*, vol. 86, July 20, 1981, p. 6435-6441. 7 refs. NASA-supported research; Contract No. DE-AS09-80EV-1033.

A quasi-synoptic survey of tidally induced salinity changes off the Georgia coast was performed by using a L band microwave radiomater onboard a NASA aircraft. Salinity maps were obtained for ebb and flood conditions in order to define the salinity distributions near rivers and sounds and major changes that occur from ebb flow to flood flow. The Savannah River plume dominated the salinity regime and extended out from the Savannah River mouth about 12 km during ebb tidal conditions. The plume merged into a band of low salinity water extending along the Georgia-South Carolina coast which was produced by the many river sources of freshwater entering the coastal waters. The changes in salinity observed offshore of the river plume area were consistent with estimates of the changes that would occur over a typical tidal excursion perpendicular to the observed gradient. (Author)

A81-42102 # **Satellite scatterometer.** A. Kühnle. *Dornier-Post* (English Edition), no. 2, 1981, p. 9, 10.

Research in the use of microwave instruments to measure ocean wind-vector fields and wave spectra is briefly discussed. The principle of determining wind vectors is examined, and a mathematical model of radar backscattering by capillary waves on the ocean surface is described. The existence of a satellite scatterometer developed in Western Europe is noted. F.G.M.

A81-42131 **Sea ice detection using enhanced infrared satellite data.** G. L. Hufford (NOAA, Satellite Field Services Station, Anchorage, AK). *Mariners Weather Log*, vol. 25, Jan.-Feb. 1981, p. 1-6.

A81-42215 * **Remote sensing of oceanic phytoplankton - Present capabilities and future goals.** W. E. Esaias (NASA, Langley Research Center, Hampton, VA). In: Primary productivity in the sea. New York, Plenum Publishing Corp., 1980, p. 321-337. 29 refs.

A description is given of current work in the development of sensors, and their integration into increasingly powerful systems, for oceanic phytoplankton abundance estimation. Among the problems relevant to such work are phytoplankton ecology, the spatial and temporal domains, available sensor platforms, and sensor combinations. Among the platforms considered are satellites, aircraft, tethered balloons, helicopters, ships, and the Space Shuttle. Sensors discussed include microwave radiometers, laser fluorosensors, microwave scatterometers, multispectral scanners, Coastal Ocean Dynamics Radar (CODAR), and linear array detectors. Consideration is also given to the prospects for such future sensor systems as the National Oceanic Satellite System (NOSS) and the Airborne Integrated Mapping System (AIMS). O.C.

A81-42228 **Application of remote sensing to monitoring and studying dispersion in ocean dumping.** R. W. Johnson and C. W. Ohlhorst (NASA, Langley Research Center, Hampton, VA). In: Ocean dumping of industrial wastes. New York, Plenum Publishing Corp., 1981, p. 175-191. 19 refs.

Remotely sensed wide area synoptic data provides information on ocean dumping that is not readily available by other means. A qualitative approach has been used to map features, such as river plumes. Results of quantitative analyses have been used to develop maps showing quantitative distributions of one or more water quality parameters, such as suspended solids or chlorophyll a. Joint NASA/NOAA experiments have been conducted at designated dump areas in the U.S. coastal zones to determine the applicability of aircraft remote sensing systems to map plumes resulting from ocean dumping of sewage sludge and industrial wastes. A second objective is related to the evaluation of previously developed quantitative analysis techniques for studying dispersion of materials in these plumes. It was found that plumes resulting from dumping of four waste materials have distinctive spectral characteristics. The development of a technology for use in a routine monitoring system, based on remote sensing techniques, is discussed. G.R.

A81-42553 # **Investigation of illumination in the image plane of the receiving optical system for the aerial or spaceborne photography of the world ocean (Issledovanie osveshchennosti v ploskosti izobrazheniia priemnoi opticheskoi sistemy pri aerokosmicheskoi s'emke akvatorii mirovogo okeana).** V. V. Polovinko (Moskovskii Institut Inzhenerov Geodezii, Aerofotos'emki i Kartografii, Moscow, USSR). *Geodeziia i Aerofotos'emka*, vol. 1, 1981, p. 73-82. 10 refs. In Russian.

The illumination in the image plane of the receiving optical system for the aerial or spaceborne photography of the ocean is studied as a function of the optical properties of the cloudless atmosphere, the ocean, and the receiving system. Equations are obtained for the brightness of ocean areas whose emission is detected by the receiving system in the visible and IR ranges. Equations describing the aerial and spaceborne photography are presented. B.J.

A81-42622 * **Wave direction measured by four different systems.** M. G. Mattie (U.S. Army, Coastal Engineering Research Center, Ft. Belvoir, VA), S. V. Hsiao (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA), and D. D. Evans (Hughes Aircraft Co., Radar Systems Group, El Segundo, CA). *IEEE Journal of Oceanic Engineering*, vol. OE-6, July 1981, p. 87-93. 13 refs. Contract No. NAS7-100.

A March 1977 wave direction measurement experiment is reported in which four systems were used to provide offshore wave-direction information: (1) synthetic aperture radar (SAR), (2) a coastal imaging radar, (3) an offshore pressure-gage array, and (4) aerial photography. From the coastal radar images and aerial photographs, the direction and length of the principal wavetrains were measured by a manual analysis. The SAR images were processed using fast Fourier transform to give two-dimensional wave spectra. Scatter diagrams are presented which intercompare the measurements of all four systems, and show good agreement among all imaging systems. It is concluded that aerial photography and SAR will prove more useful when wave measurements are needed over a large area or when there are rapidly changing wave characteristics. O.C.

A81-43206 **Iceberg detectability problems using SAR and SLAR systems.** M. E. Kirby and R. T. Lowry (Intera Environmental Consultants, Ltd., Ottawa, Canada). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.

Minneapolis, MN, American Water Resources Association, 1981, p. 200-212. 10 refs. Research supported by the Intertech Remote Sensing, Ltd.

The application of synthetic aperture radar (SAR) and real aperture side-looking airborne radar (SLAR) systems for the identification of icebergs involves an understanding of the complicated interactions between the radar beams and the multi-faceted bergs. This paper summarizes the major problems that have been encountered in iceberg census research from selected portions of SLAR and SAR airborne experiments that were recently conducted. Since little radar iceberg data have been gathered from space satellites, the airborne systems offer attractive simulation possibilities. These systems have been used here to address such topics as iceberg detectability in relation to resolution, depression angle, sea clutter, and iceberg size and type. (Author)

A81-43244 **Multispectral kelp resource surveys.** J. R. Jensen (Georgia, University, Athens, GA), J. E. Estes (California, University, Santa Barbara, CA), and M. Mel (Geoscientific and Consulting, Playa Del Rey, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.

Minneapolis, MN, American Water Resources Association, 1981, p. 533-542. 23 refs.

A multispectral approach to monitoring kelp resources is reported. Four dates of high-altitude color-infrared aerial photography (1:125,000), four dates of Landsat digital imagery, and two dates of X-band radar imagery were analyzed yielding kelp acreage estimates for beds along the Southern California Bight. These estimates were compared with statistics compiled by a private photogrammetric engineering firm responsible for monitoring Southern California beds. The practicality of monitoring kelp using these remote sensing systems is discussed. (Author)

A81-43245 **Remote sensing of coastal pollutants using multispectral data.** W. Philpot and V. Klemas (Delaware, University, Newark, DE). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 543-549. 6 refs.

In this paper we describe an attempt to use Landsat multispectral imagery for detection and classification of pollutants in coastal waters. The analysis technique applied to the Landsat data is the eigenvector (principal components) analysis. This proved to be a fairly useful method for detecting iron acid waste off the coast of Delaware and in the New York Bight, and may prove a useful technique for inland waters as well. A qualitative relationship between the apparent water color and the concentration and depth of a pollutant is described. (Author)

A81-43246 * **Aerospace remote sensing of the coastal zone for water quality and biotic productivity applications.** E. B. Pritchard and R. C. Harriss (NASA, Langley Research Center, Marine and Applications Technology Div., Hampton, VA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 550-562. 25 refs.

Remote sensing can provide the wide area synoptic coverage of surface waters which is required for studies of such phenomena as river plume mixing, phytoplankton dynamics, and pollutant transport and fate, but which is not obtainable by conventional oceanographic techniques. The application of several remote sensors (aircraftborne and spacecraftborne multispectral scanners, passive microwave radiometers, and active laser systems) to coastal zone research is discussed. Current measurement capabilities (particulates, chlorophyll a, temperature, salinity, ocean dumped materials, other pollutants, and surface winds and roughness) are defined and the results of recent remote sensing experiments conducted in the North Atlantic coastal zone are presented. The future development of remote sensing must rely on an integrated laboratory research program in optical physics. Recent results indicate the potential for separation of particulates into subsets by remote sensors. (Author)

A81-43247 **Digital analysis of Landsat MSS data and application for coastal marine environment.** H. Ochiai (Toba Merchant Marine College, Toba, Japan) and Y. Suzuki (Facom Information Processing Co., Tokyo, Japan). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 563-569.

This paper presents the techniques of image analysis of remote sensing data obtained by Landsat in the study of marine environment applications in the coastal area of Japan. In the analysis of remote sensing data for a specific object, thematic analysis with feature extraction and classification techniques for pattern recognition has become more popular. In the digital analysis, spectral characteristics of the data can be expressed quantitatively. Many flexible techniques can also be incorporated to find out the most effective method of analysis of remote sensing and field application. In an analysis of the marine environment, the classification per area is more effective than the classification per pixel. For relatively simple methods with a wide variety of application, methods have been developed in which imagery is classified and analyzed concerning the similarity of spectral data. (Author)

A81-43248 **Satellite observations of a geothermal submarine spring off Florida west coast.** F. A. Kohout (U.S. Geological Survey, Woods Hole, MA), R. C. Munson (NOAA, Norfolk, VA), R. M. Turner (U.S. Geological Survey, Reston, VA), and W. R. Royal. In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 570-578. 20 refs.

A81-43250 **Combined satellite imagery for study of coastal circulation, Onslow Bay, North Carolina.** C. W. Welby and L. J. Pietrafesa (North Carolina State University, Raleigh, NC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 585-592. 18 refs. Research supported by the North Carolina State University; U.S. Bureau of Land Management Contract No. 025-08; Contract No. EY-71-5-09-0902.

A photo-optical technique using satellite imagery has been devised to study surface and near surface circulation patterns in the shallow shelf waters of Raleigh and Onslow bays, North Carolina. The NOAA-5 VHRR thermal imagery was matched photographically to the scale of the Landsat 70 mm transparencies, and the transparencies were superimposed in a color additive viewer, taking advantage of the scaling and rotational capabilities of the viewer. Various combinations of filters together with positive and negative transparencies were used to enhance the imagery for interpretation. Through photographic enlargement and the projection capabilities of the viewer, imagery has been studied at scales between approximately 1:850,000 and 1:250,000. Combination of the imagery types enables the interpreter to differentiate between cold and warm water masses, to interpret circulation patterns at the instant of imaging, and to identify the patterns of suspended matter distribution and dispersion in the shallow bays. With this information the interpreter can improve his understanding of the relative effects of varying forces on water mass movement. (Author)

A81-43251 * **Satellite detection of oil on the marine surface.** M. J. Wilson, P. E. O'Neill (NASA, Washington, DC), and J. E. Estes (California, University, Santa Barbara, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 593-602. 14 refs.

The ability of two widely dissimilar spaceborne imaging sensors to detect surface oil accumulations in the marine environment has been evaluated using broadly different techniques. Digital Landsat multispectral scanner (MSS) data consisting of two visible and two near infrared channels has been processed to enhance contrast between areas of known oil coverage and background clean surface water. These enhanced images have then been compared to surface verification data gathered by aerial reconnaissance during the October 15, 1975, Landsat overpass. A similar evaluation of oil slick imaging potential has been made for digitally enhanced Seasat-A synthetic aperture radar (SAR) data from July 18, 1979. Due to the premature failure of this satellite, however, no concurrent surface verification data were collected. As a substitute, oil slick configuration information has been generated for the comparison using meteorological and oceanographic data. The test site utilized in both studies was the extensive area of natural seepage located off Coal Oil Point, adjacent to the University of California, Santa Barbara. (Author)

A81-43539 * **Drift and dispersion studies of ocean-dumped waste using Landsat imagery and current drogues.** V. Klemas and W. D. Philpot (Delaware, University, Newark, DE). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Apr. 1981, p. 533-542. 27 refs. Research supported by Du Pont de Nemours and Co.; Contract No. NAS5-20983.

The drift and dispersion of industrial acid wastes dumped 64 km off the Delaware coast were investigated using 16 Landsat images. Waste plume drift velocities and spread rates were obtained, and principal component analysis was performed to discriminate the acid waste from other pollutants. Waste plumes averaged drifting rates from 0.59 km/hr to 3.39 km/hr into the southwest quadrant, and remained above the thermocline, which formed at depths ranging from 13 m to 24 m. Rapid waste movement toward shore occurred primarily during storms, although plumes were rapidly dispersed and diluted at spread rates in excess of 4 cm/sec. Landsat data analysis also indicates plume width increase of about 1.5 cm/sec during calm sea conditions, which is also in agreement with Falk's (1974) estimates of plume dilution. D.L.G.

A81-43967 # **Features of the radar detection of sea surface nonuniformities (Osobennosti obnaruzheniia neodnorodnostei morskoi poverkhnosti radiolokatsionnym metodom).** A. I. Kalmykov and A. P. Pichugin (Akademiia Nauk Ukrainskoi SSR, Institut Radiofiziki i Elektroniki, Kharkov, Ukrainian SSR). *Akademiia Nauk SSSR, Izvestiia, Fizika Atmosfery i Okeana,* vol. 17, July 1981, p. 754-761. 9 refs. In Russian.

Amplitude (mean and fluctuation) and spectral characteristics of radar scattering by both a uniform sea surface and nonuniformities in the form of slicks are presented. It is shown that scattering from slicks within a broad range of incidence angles can be described in the framework of a selective scattering model (the two-scale model). Using typical examples of obtained results, the possibilities of processing radar signals are discussed, with the aim of detecting slicks and determining their main parameters. J.F.

A81-44861 **Satellite determination of the mesoscale variability of the sea surface temperature.** P. Y. Deschamps, R. Frouin (Lille I, Université, Villeneuve-d'Ascq, Nord, France) and L. Wald (Paris, Ecole Nationale Supérieur des Mines, Valbonne, Alpes-Maritimes, France). *Journal of Physical Oceanography,* vol. 11, June 1981, p. 864-870. 21 refs. Research supported by the Centre National de la Recherche Scientifique, Centre National d'Etudes Spatiales, and Centre National pour l'Exploitation des Océans.

Satellite infrared data have been used to investigate the mesoscale variability of the SST (sea surface temperature) field. A statistical analysis of the SST field has been performed by means of the structure function. Results give the equivalent power-law exponent n of the spatial variance density spectrum. The exponent n was found to vary from 1.5 to 2.3 with a mean value of 1.8 in the range of scales 3-100 km which is in agreement with previous one-dimensional analysis from shipborne and airborne measurements. These observed values of n are discussed and compared with the values predicted by turbulence theories. A.L.W.

A81-45436 **Particular features of the ocean glitter pattern observed from a sun-synchronous orbit.** J. C. Kosik (Centre National d'Etudes Spatiales, Toulouse, France) and G. Paci (ESA, Earth Observation Programme Office, Toulouse, France). *International Journal of Remote Sensing,* vol. 2, July-Sept. 1981, p. 265-275. 6 refs.

An analysis method is developed to locate the point of maximum sea surface glitter for a scanner on a sun-synchronous orbit. A simulation of the ocean glitter effect is conducted, and sun glint avoidance methods are discussed. Results show the spread of the glitter pattern over a large area around the point of specular reflection. Patterns suggest symmetry features which may be used to develop a simplified analysis of the glitter problem. Possible benefits of the simplified computation method include the extension to any type of scanning system, and plotting the latitude and scanning angle of specular reflection for descending and ascending daylight passes respectively. The method is also applied to two specific problems, and the solutions are discussed. D.L.G.

A81-45861 **Remote sensing of atmospheres and oceans; Proceedings of the Interactive Workshop on Interpretation of Remotely Sensed Data, Williamsburg, VA, May 23-25, 1979.** Workshop sponsored by the U.S. Navy and Institute for Atmospheric Optics and Remote Sensing; Contract No. N00014-79-G-0039. Edited by A. Deepak (Institute for Atmospheric Optics and Remote Sensing, Hampton, VA). New York, Academic Press, Inc., 1980. 655 p. $45.

The workshop focused on the current state of knowledge as well as on the results of the latest investigations in the fields of remote sensing of oceanographic, terrestrial, and atmospheric quantities. Topics discussed include: recent advances in inversion methods, atmospheric temperature sounding, interpretation of aerosol sounding, and gaseous constituent retrievals. Other topics are: remote sounding by microwaves, sounding of sea surface temperature, ocean color, and winds, and interpretation of recent results from space.

V.L.

A81-45881 **Application of the truncated normal distribution technique to the derivation of sea surface temperatures.** H. E. Fleming (NOAA, National Environmental Satellite Service, Washington, DC). In: Remote sensing of atmospheres and oceans; Proceedings of the Interactive Workshop on Interpretation of Remotely Sensed Data, Williamsburg, VA, May 23-25, 1979.

New York, Academic Press, Inc., 1980, p. 503-544; Discussion, p. 545. Navy-supported research.

The truncated normal distribution technique is applied to the derivation of sea surface temperatures from high-resolution satellite measurements in the 11-micron window region. The purpose of this technique is to remove cloud contamination from the measurements. This procedure produces sea surface temperature maps on a mesoscale level so that a reasonably small-scaled temperature structure, such as that found in the Gulf Stream, can be determined. Because not all the cloud contamination is removed by the truncated normal distribution technique, the resulting temperature fields are modified by an error detection and correction technique. Results from both simulated and real data are presented. No attempt has been made to account for atmospheric attenuation by water vapor; therefore, the results are accurate in only a relative sense. (Author)

A81-46104 **Spaceborne synthetic aperture radar for oceanography.** Edited by R. C. Beal (Johns Hopkins University, Laurel, MD), P. S. DeLeonibus (NOAA, Washington, DC), and I. Katz (Johns Hopkins University, Laurel, MD). Baltimore, MD, Johns Hopkins University Press (Johns Hopkins Oceanographic Studies, No. 7), 1981. 215 p. $19.50.

Topics discussed include the structure of short gravity waves on the ocean surface, the statistical characteristics of wind generated short gravity waves, and SAR ocean imaging mechanisms. Papers are presented on the variability of winds over the ocean, the problems in ocean wave hindcasting, and surface signs of internal ocean dynamics. C.R.

A81-46105 * **The structure of short gravity waves on the ocean surface.** O. M. Phillips (Johns Hopkins University, Baltimore, MD). In: Spaceborne synthetic aperture radar for oceanography. Baltimore, MD, Johns Hopkins University Press, 1981, p. 24-31. 14 refs. NASA-supported research.

A brief review is given of the salient properties of short gravity waves and the way in which their structure is modified by longer waves or swell, by variable currents, and by internal waves. It is noted that an underlying swell produces a mottled pattern in synthetic aperture radar (SAR) imagery, and an expression is derived giving the fractional modulation in backscattering cross section of the ocean surface in terms of the slope of an underlying swell, the wind direction, and the direction of swell propagation relative to the angle of observation. The expression provides the possibility in appropriate circumstances of estimating the swell slope by remote sensing, in addition to the wavelength and direction of propagation, which can be measured directly from the imagery. An account is also given of the refraction of waves in variable currents and internal waves. C.R.

A81-46107 **SAR ocean imaging mechanisms.** R. O. Harger (Maryland, University, College Park, MD). In: Spaceborne synthetic aperture radar for oceanography. Baltimore, MD, Johns Hopkins University Press, 1981, p. 41-52. 14 refs.

It is noted that in applying synthetic aperture radar (SAR) to oceanography the basic SAR theory must be extended to account for scattering from a time-varying surface that satisfies nonlinear hydrodynamic restraints. A model that assumes a two-scale ocean surface is discussed. Nonlinear electromagnetic and hydrodynamic interactions produce a complex image dependence on the two scales. A spectral expansion of the image is given, and the contributions from the nonlinear interactions and scattering mechanism are identified. Under certain conditions, the image is a linear, space-variant transformation, decomposable into three more easily understood transformations, of an effective reflectivity density at a reference time. C.R.

A81-46109 # **The wind speed dependency of ocean microwave backscatter.** D. B. Ross (NOAA, Sea-Air Interaction Laboratory, Miami, FL). In: Spaceborne synthetic aperture radar for oceanography. Baltimore, MD, Johns Hopkins University Press, 1981, p. 75-86. 21 refs.

Seasat SAR imagery of the ocean is analyzed in terms of the forcing atmosphere and the forcing ocean. In comparison with other types of measurements of surface wind speed, rainfall, wave roughness conditions, and air-sea temperature differences, it is found that the short ocean waves responsible for the radar backscatter are strongly coupled to the local wind and are modulated by rainfall rate and air-sea temperature differences, especially when the sign of the difference is changing rapidly. C.R.

A81-46110 * # **The study of mesoscale ocean winds.** W. L. Jones, E. M. Bracalente (NASA, Langley Research Center, Hampton, VA), and V. E. Delnore (Kentron International, Inc., Hampton, VA). In: Spaceborne synthetic aperture radar for oceanography. Baltimore, MD, Johns Hopkins University Press, 1981, p. 87-94. 11 refs.

SAR data gathered over the U.S. East Coast are used to infer near-surface wind speed, using a simplified model to relate the strength of the 30 to 40 cm SAR backscatter to surface wind speed. It is found that the SAR backscatter is nearly isotropic with a wind speed exponent of 0.4. Using this exponent, the model is tested against an independent data set. Subsequent agreement between wind speeds simultaneously determined by SAR and the Seasat-A Satellite Scatterometer (SASS) is within 0.7 m/s rms. A one-dimensional Fourier transform of the SAR-derived wind field shows an increasing energy content in rough agreement with the Van der Hoven spectrum. C.R.

A81-46112 * **Spatial evolution of ocean wave spectra.** R. C. Beal (Johns Hopkins University, Applied Physics Laboratory, Laurel, MD). In: Spaceborne synthetic aperture radar for oceanography. Baltimore, MD, Johns Hopkins University Press, 1981, p. 110-127. 24 refs. NASA-Navy-supported research; Contract No. NOAA-MO-A01-78-00-4330.

The spatially evolving deep water synthetic aperture radar (SAR) directional spectra of a mixed ocean wave system are compared with a comprehensive set of surface and aircraft measurements. The evolution of the SAR spectra, at least for ocean wavelengths greater than 80 m, is seen as generally consistent with the auxiliary data set in both time and space. From the spatial evolution of the angular component of the spectra, it is possible to project back to an apparent remote storm source that is also consistent with the storm location via GOES satellite imagery. The data provide compelling evidence that the spatial evolution of SAR ocean wave spectra can be a useful tool in global ocean wave monitoring and forecasting. C.R.

A81-46113 * **Refraction of coastal ocean waves.** R. A. Shuchman and E. S. Kasischke (Michigan, Environmental Research Institute, Ann Arbor, MI). In: Spaceborne synthetic aperture radar for oceanography. Baltimore, MD, Johns Hopkins University Press, 1981, p. 128-135. 16 refs. NASA-supported research; Contract No. NOAA-MO-A01-78-00-4339.

Refraction of gravity waves in the coastal area off Cape Hatteras, NC as documented by synthetic aperture radar (SAR) imagery from Seasat orbit 974 (collected on September 3, 1978) is discussed. An analysis of optical Fourier transforms (OFTs) from more than 70 geographical positions yields estimates of wavelength and wave direction for each position. In addition, independent estimates of the same two quantities are calculated using two simple theoretical wave-refraction models. The OFT results are then compared with the theoretical results. A statistical analysis shows a significant degree of linear correlation between the data sets. This is considered to indicate that the Seasat SAR produces imagery whose clarity is sufficient to show the refraction of gravity waves in shallow water. C.R.

A81-46115 # **Detection of the Gulf Stream.** R. M. Hayes (U.S. Coast Guard, Washington, DC). In: Spaceborne synthetic aperture radar for oceanography. Baltimore, MD, Johns Hopkins University Press, 1981, p. 146-160. 44 refs.

Aircraft and satellite thermal infrared and visual indicators are used to locate Gulf Stream boundaries, which are compared with those apparent in Seasat synthetic aperture (SAR) imagery. Emphasis in the analysis is on orbits 400 and 931, which capture the semipermanent Gulf Stream meander that develops when the current passes over the Charleston Rise. Results demonstrate that identifiable linear features in the SAR imagery are correlated with the current velocity shear zone. Gulf Stream detection is seen as related to modulation of the small gravity wave field at the boundary of the swift current yielding long, distinct, linear features in the radar imagery. It is noted that tonal and/or textural contrast of the water within and outside the Gulf Stream arising from a sea surface temperature-induced difference in the effect of wind stress on surface roughness may also contribute to Gulf Stream detection. Backscatter measurements made along transects across the Gulf Stream are given in order to characterize the signature of a SAR-to-scene transfer function that reveals the nature of the Gulf Stream radar cross section at the boundaries. C.R.

A81-46116 * # **A search for cold water rings.** R. E. Cheney (NASA, Goddard Space Flight Center, Greenbelt, MD). In: Spaceborne synthetic aperture radar for oceanography. Baltimore, MD, Johns Hopkins University Press, 1981, p. 161-170. 23 refs.

SAR imagery obtained by Seasat in the Sargasso Sea during 1978 is examined for cold ring signatures. One orbit on August 26 is thought to have imaged the edge of a cold ring, although the ring's position was not well known at the time. During another orbit on September 23, drifting buoy and expendable bathythermography data furnished conclusive evidence that the ring was centered directly in the SAR swath. Although some suggestive patterns are visible in the images, it is not clear that cold rings can be identified by SAR, even though dynamically similar features, such as the Gulf Stream and warm rings, can be accurately detected. The suggestion is made that cold rings may be imaged inadequately because of their lack of surface temperature gradient. C.R.

A81-46117 # **Tracking of a warm water ring.** D. E. Lichy, M. G. Mattie, and L. J. Mancini (U.S. Army, Coastal Engineering Research Center, Fort Belvoir, VA). In: Spaceborne synthetic aperture radar for oceanography. Baltimore, MD, Johns Hopkins University Press, 1981, p. 171-182. 7 refs.

The imaging of a warm water ring off the East Coast of the U.S. by the Seasat synthetic aperture radar (SAR) on descending orbit six times during September and October of 1978 is discussed. The location and microwave response of SAR imagery for the rings are compared with NOAA-5 thermal infrared imagery and frontal analysis maps from the U.S. Naval Oceanographic Office. Centers of the rings are found to coincide within about 10 km. The diameters of the warm water rings delineated on the SAR imagery turn out to be smaller than on NOAA-5 imagery. The distinguishing features of the warm water ring area on the SAR imagery are concentric curvilinear features less than 1 km wide and as long as 150 km. The ability of the SAR to track warm water rings and the type of microwave return are discussed. C.R.

A81-46919 # **Nimbus-7 Coastal-Zone Colour Scanner data processing for Earthnet - Experience to date.** L. Fusco (ESA, Earthnet Programme Office, Frascati, Italy). *ESA Bulletin,* no. 27, Aug. 1981, p. 36-42.

A status report is given for the Earthnet program office's acquisition, preprocessing, archiving and distribution to users of Coastal Zone Color Scanner (CZCS) data from the Nimbus-7 satellite. These data are being used to demonstrate the usefulness of satellite coastal waters monitoring in such major issues as: (1) the optimum qualification and quantification of suspended materials and (2) definition of the requirements for future ocean monitoring equipment. In addition to detailed tabulations of Nimbus-7 and CZCS performance parameters, a list is given of the individual research objectives of the European countries participating in the data sharing program and examples are given of raw data products, system-corrected products, geophysical data products, and the Nimbus-7 CZCS data catalogue. O.C.

A81-47004 # **Correlation between integral and spectral albedos of clouds over water surfaces (Sootnoshenie integral'nogo i spektral'nogo al'bedo oblakov nad vodnoi poverkhnost'iu).** V. I. Binenko. In: Radiation studies in the atmosphere. Leningrad, Gidrometeoizdat, 1980, p. 29-32. 5 refs. In Russian.

An analysis is presented of airborne measurements conducted during 1971-1972 in the framework of the KENEX cloud program;

cumulus cloud cover over the Black Sea, the Sea of Azov, the Karskii Sea, and Ladozhskii Lake was investigated. The results were used to determine correlations between integral (0.3-3.0 microns) and spectral (0.6-0.92, 0.76, 0.69-0.74, 0.4-0.65, 0.676, 0.457, 0.391, and 0.369 micron) cloud albedos over water surfaces. F.G.M.

A81-47021 # **Application of GOES visible-infrared data to quantifying mesoscale ocean surface temperatures.** G. A. Maul (NOAA, Atlantic Oceanographic and Meteorological Laboratories, Miami, FL). *Journal of Geophysical Research,* vol. 86, Sept. 20, 1981, p. 8007-8021. 29 refs. Research supported by the U.S. Department of Energy.

The investigation is concerned with the possibility to use data from the Geostationary Operational Environmental Satellite (GOES) for the solution of sea surface temperature problems, taking into account the Gulf of Mexico as the test area because it is ringed with upper air stations from which atmospheric corrections can be calculated. A theoretical error analysis, with which to explain the + or - 1 to + or - 4 K errors being reported, is conducted. On the basis of the error analysis, an objective procedure is developed to quantify the satellite-derived temperatures from GOES at an acceptable level of accuracy. The procedure is applied to the Gulf of Mexico for October 1977. In the considered case, data from two research ships are available to serve as surface verification information. The described procedure, which is labor intensive, is not considered as an alternative to the GOSSTCOMP. The goal is rather to determine with it the temperature patterns well enough so that they may be used to study the physics of certain dynamical oceanographic processes. G.R.

A81-47022 **Satellite-tracked drift buoy observations of the near-surface flow in the eastern mid-latitude North Pacific.** G. J. McNally (California, University, La Jolla, CA). *Journal of Geophysical Research,* vol. 86, Sept. 20, 1981, p. 8022-8030. 20 refs. Contract No. N00014-75-C-0152.

The considered observations show that the large-scale coherent flow is essentially always along the isobars of sea level pressure, 20 - 30 deg to the right of the surface winds, at approximately 1.5% of the wind speed during the periods of strong persistent atmospheric forcing normally observed in the fall, winter, and spring seasons. Mesoscale energetics with time and length scales of 30 days and 100 km are clearly seen in near surface flow in the summer months. The large-scale, coherent flow observed during the fall through spring seasons is essentially unaltered over the upper 30 m of the mixed layer. Vertical shear in the large-scale flow is clearly observed when the drifters are drogued to depths of 100 m or more. This suggests that the droguing technique used is effective and therefore the lack of difference in the current observations of undrogued drifters and those drogued at 30 m is due to a lack of vertical shear in the horizontal currents over the upper 30 m during periods of strong persistent atmospheric forcing. G.R.

A81-47099 **Remote sounding of atmosphere and ocean for climate research /Appleton Lecture/.** J. T. Houghton (Science Research Council, Rutherford and Appleton Laboratories, Chilton, Oxon, England). *IEE Proceedings, Part A - Physical Science, Measurement and Instrumentation, Management and Education, Reviews,* vol. 128, pt. A, no. 6, Sept. 1981, p. 442-448. 23 refs.

A description is presented of different types of satellite-borne remote sounding techniques of importance for the World Climate Research Program (WCRP). The WCRP is concerned with the attainment of a better understanding of climate and climatic change, particularly on time scales in the range from weeks to decades. The Global Atmospheric Research Program culminated in 1979 in the Global Weather Experiment, during which the atmosphere was observed as completely as possible for the period of a year. The purpose of the Global Weather Experiment was to investigate to what extent the atmosphere's large-scale circulation can be modelled and predicted by large numerical models. A particularly important remote sounding measurement from satellites is that of the temperature structure of the atmosphere below the satellite. In the case of remote temperature sounding, it is necessary to improve operational algorithms and procedures which make more complete use of the data. Improved sampling is needed for radiation-budget measurements. G.R.

A81-47344 **The first ESA remote sensing satellite /ERS/ - The programme and the system.** D. Lennertz and C. Honvault (ESA, Earth Observation Programme Dept., Toulouse, France). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-90.* 14 p.

The European Space Agency is currently developing the first ESA Remote Sensing Satellite (ERS) system which will, as its first mission, monitor the ice and ocean regions. The objectives of the mission are both to increase scientific understanding of coastal zones and ocean processes and to develop economic applications related to a better knowledge of ocean parameters and sea state conditions. The payload of ERS-1 includes: (1) active microwave instrumentation, combining the functions of a synthetic aperture radar, a wave scatterometer, and a wind scatterometer, in order to measure wind fields and wind spectra; (2) a radar altimeter, for measuring significant wave heights; and (3) an ocean color monitor for measuring sea surface temperature and ocean color. The ERS-1 payload will be launched by ARIANE-2 in 1987 on a sun-synchronous orbit at 675 km. It will provide worldwide coverage, compatible with the duty cycles of its payload instruments and ensure real time acquisition through its own station network. The resulting data products will be listed by level, ranging from raw data to quick-look data to preprocessed products. Various ground segments associated with the satellite are presented. J.F.

A81-47348 **Radar altimeter for ocean remote sensing.** S. Pardini, R. Ronconi, R. Somma (Selenia S.p.A., Rome, Italy), and G. Picardi (Roma, Università, Rome, Italy). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-94.* 10 p. European Space Agency Contract No. 4428/80.

Ocean radar altimetry is based on the electromagnetic backscattering of the ocean surface in response to a narrow pulse waveform under near normal incidence. The altimeter described is used to determine the satellite altitude over the sea surface, the significant wave height, and wind speeds. The instrument requires accuracy, implying high precision in radar measurements of the pertinent return echo parameters. Problem areas such as pull-in phase initialization and tracking phase are discussed and the adopted solution includes using two separated loops. The RF/IF unit and the signal processor are also discussed. A radar altimeter functional block diagram is given, as are error signals of range and slope discriminators and the deterministic simulation of loops operation. Finally the main parameters include a peak power of 400 W, a frequency of 13.5 GHz and an antenna gain of 40 dB. J.F.

A81-48548 * **The National Oceanic Satellite System.** W. J. Hussey (NOAA, National Earth Satellite Service, Suitland, MD). In: EASCON '80; Electronics and Aerospace Systems Conference, Arlington, VA, September 29-October 1, 1980, Conference Record. New York, Institute of Electrical and Electronics Engineers, 1980, p. 295-305.

It is noted that satellites equipped with microwave sensors will make possible the collection of oceanic data on a global basis under all weather conditions. The National Oceanic Satellite System (NOSS), which will provide a five-year operational demonstration of satellite sensing of oceanic phenomena, is described. The system will measure parameters characterizing the wind, sea surface temperature, waves, ice, water mass definition, and horizontal surface currents. The benefits expected from NOSS are listed. They include improvements in sea ice boundary analyses, which will assist fishing operations near the ice edge, and improvements in the ability to forecast severe storms. Each of NOSS's primary sensors - the Scatterometer, Altimeter, Coastal Zone Color Scanner, and Large Antenna Multichannel Microwave Radiometer - is described, and a table giving sensor characteristics is included. C.R.

A81-48681 # **Infrared imagery for studying the Kara-Bogaz-Gol Bay (Teplovaia s'emka pri izuchenii zaliva Kara-Bogaz-Gol).** V. I. Gornyi (Vsesoiuznoe Aerogeologicheskoe Nauchno-Proizvodstvennoe Ob'edinenie Aerogeologiia, Leningrad, USSR). *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 11-17. 8 refs. In Russian.

Results of theoretical and experimental studies of the thermal field of the surface of the salt stratum of the Kara-Bogaz-Gol Bay and several dry salt lakes of West Turkmenia are presented. The dependence of diurnal fluctuations of the surface temperature of the moist salt stratum on the air humidity is shown. To substantiate the possibility of using infrared satellite imagery for studying the salt stratum of the Bay, aerial infrared images of the salt cover are presented, illustrating the good imaging properties of the surface's thermal field relative to the composition, structure, and moisture of the salt. It is concluded that infrared satellite imagery can be used to study the hydrological and hydrochemical conditions of the Bay. J.F.

A81-48687 # **An analysis of the data of synchronous measurements from the Meteor satellite and ships at the eastern coast of the Caspian Sea (Analiz dannykh sinkhronnykh izmerenii s ISZ 'Meteor' i sudov u Vostochnogo poberezh'ia Kaspiiskogo Moria).** G. P. Vaniushin, V. N. Diadiunov, and S. M. Sazhin (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Morskogo Rybnogo Khoziaistva i Okeanografii; Gosudarstvennyi Nauchno-Issledovatel'skii Tsentr Izucheniia Prirodnykh Resursov, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 54-60. 16 refs. In Russian.

Data were obtained from synchronous measurements by the Meteor satellite and ships at the eastern coast of the Caspian Sea on Sept. 22, 1978. Results of the investigation, which involved 26 hydrological stations, were used to show the relationship between the brightness of the water medium, the concentration of chlorophyll, the suspension of inorganic matter, and the values of relative transparency. J.F.

A81-49126 **Satellites for oceanography - The promises and the realities.** R. Goody (Harvard University, Cambridge, MA). *Oceanus,* vol. 24, Fall 1981, p. 3-5.

The problems encountered in assimilating satellite data into oceanographic research are discussed. The possibilities offered by satellites are illustrated by describing the Coastal Zone Color Scanner, the infrared sounder, the active radar scatterometer, and the synthetic aperture radar. It is stressed that remote sensing techniques from satellites are here to stay, and the oceanographic community is urged to embrace them. It is pointed out that if oceanographic science is to profit to a maximum, planning must start for combinations of measurements from satellites, aircraft, buoys, ships, and islands. C.R.

A81-49127 * **Oceanography from satellites.** W. S. Wilson (NASA, Oceanic Processes Branch, Washington, DC). *Oceanus,* vol. 24, Fall 1981, p. 9-16. 14 refs.

It is pointed out that oceanographers have benefited from the space program mainly through the increased efficiency it has brought to ship operations. For example, the Transit navigation system has enabled oceanographers to compile detailed maps of sea-floor properties and to more accurately locate moored subsurface instrumentation. General descriptions are given of instruments used in satellite observations (altimeter, color scanner, infrared radiometer, microwave radiometer, scatterometer, synthetic aperture radar). It is pointed out that because of the large volume of data that satellite instruments generate, the development of algorithms for converting the data into a form expressed in geophysical units has become especially important. C.R.

A81-49128 **The promise of satellite altimetry.** C. Wunsch (MIT, Cambridge, MA). *Oceanus,* vol. 24, Fall 1981, p. 17-26. 5 refs.

The contributions that an altimetric satellite could make to oceanography are discussed. It is noted that such a satellite would provide a global view of the surface elevation of the ocean every few days. Since the surface elevation can be related to the velocity at depth fairly easily, a new altimetric mission could give a fast, quantitative measure of the state of the ocean. But its real value is that by combining altimetric measurements with the equations of motion, the altimeter could be used to provide accurate data for numerical models of the global circulation, both to analyze the state of the sea and, potentially, to forecast it. A description is given of the Ocean Topography Experiment (Topex). C.R.

A81-49129 **The future for satellite-derived surface winds.** J. J. O'Brien (Florida State University, Tallahassee, FL). *Oceanus,* vol. 24, Fall 1981, p. 27-31.

It is noted that cautious agreement exists that the scatterometer is capable of measuring wind speed in many weather situations to within 2 meters per second (approximately 5 miles per hour). It is also able to measure wind direction. If the orbit of a satellite carrying a scatterometer were adjusted to altitudes of about 2,400 km, the satellite could cover the entire globe in a few days. For the first time, it would be possible to have a global distribution of wind estimates every week or so. What is more, with a satellite wind-observing system, the Ekman drift current could be calculated on a regular basis. These estimates could be used for search and rescue operations, as well as for pollution transport problems. C.R.

A81-49130 * # **Remote sensing in biological oceanography.** W. E. Esaias (NASA, Langley Research Center, Hampton, VA). *Oceanus,* vol. 24, Fall 1981, p. 32-38.

The main attribute of remote sensing is seen as its ability to measure distributions over large areas on a synoptic basis and to repeat this coverage at required time periods. The way in which the Coastal Zone Color Scanner, by showing the distribution of chlorophyll a, can locate areas productive in both phytoplankton and fishes is described. Lidar techniques are discussed, and it is pointed out that lidar will increase the depth range for observations. C.R.

A81-49132 **Climate, the oceans, and remote sensing.** F. P. Bretherton (National Center for Atmospheric Research, Boulder, CO). *Oceanus,* vol. 24, Fall 1981, p. 49-55.

It is noted that an understanding of the workings of the climate system and an ability to predict year-to-year variations and long-term changes resulting from man's activities will require extensive observations of the ocean. The surface temperature and flux of heat through the surface are identified as key variables for the atmospheric circulation. The wind stress on the surface and the net of evaporation less rainfall are also seen as important factors in oceanic circulation. The long-term redistribution of heat by the ocean currents and year-to-year fluctuations in heat storage are identified as central climatic variables. It is thought that satellite observations, because of their global perspective, may play a key role in many of these areas. C.R.

A81-49133 * **Commercial applications of satellite oceanography.** D. R. Montgomery (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *Oceanus,* vol. 24, Fall 1981, p. 56-65. 11 refs. Contract No. NAS7-100.

It is shown that in the next decade the oceans' commercial users will require an operational oceanographic satellite system or systems capable of maximizing real-time coverage over all ocean areas. Seasat studies suggest that three spacecraft are required to achieve this. Here, the sensor suite would measure surface winds, wave heights (and spectral energy distribution), ice characteristics, sea-surface temperature, ocean colorimetry, height of the geoid, salinity, and subsurface thermal structure. The importance of oceanographic data being distributed to commercial users within two hours of observation time is stressed. Also emphasized is the importance of creating a responsive oceanographic satellite data archive. An estimate of the potential dollar benefits of such an operational oceanographic satellite system is given. C.R.

A81-49378 **Compact and highly sensitive fluorescence lidar for oceanographic measurements.** U. Gehlhaar, K. P. Gunther, and J. Luther (Oldenburg, Universität, Oldenburg, West Germany). *Applied Optics,* vol. 20, Oct. 1, 1981, p. 3318-3320. 12 refs. Research supported by the Deutsche Forschungsgemeinschaft.

A compact and highly sensitive helicopter-borne fluorescence lidar is described. The single channel system is based on a high power, tunable laser. From an altitude of 70 m, selective detection of the tracer dye rhodamine B of less than 10 to the -10th g/cu cm in natural waters is achieved. (Author)

A81-49426 # **Theoretical investigations concerning the measurement of the plankton concentration with the aid of satellites (Theoretische Untersuchungen zur Messung der Plaktonkonzentration mit Hilfe von Satelliten).** G. Metzig (Köln, Universitat, Cologne, West Germany) and M. Kerschgens (Bonn, Universitat, Bonn, West Germany). *(Deutsche Meteorologen-Tagung und Internationales Alfred-Wegener-Symposium, Berlin, West Germany, Feb. 25-29, 1980.) Annalen der Meteorologie,* no. 15, 1980, p. 154, 155. 5 refs. In German.

A description is presented of a theoretical model which provides information regarding the possibilities to determine plankton concentrations in the ocean by remote sensing. The model makes use of the theory of radiation transport. Radiative flux in the ocean and radiation densities in the atmosphere are computed for fifteen spectral intervals in the range from 0.3 to 0.76 micrometers. The mathematical procedure consists of a combination of an iterative solution scheme and a modified two-stream method. The preliminary objective of the considered study is related to a calculation of the change in the surface albedo of the sea by plankton, and the possibilities which exist for measuring this change with an instrument located at the upper boundary of the atmosphere. G.R.

A81-49649 # **Atlantic hurricane season of 1980.** M. B. Lawrence and J. M. Pelissier (NOAA, National Hurricane Center, Miami, FL). *Monthly Weather Review,* vol. 109, July 1981, p. 1567-1582.

A summary of the 1980 hurricane season is presented. Eleven named tropical cyclones were tracked, of which nine reached hurricane force. Allen, an intense storm, affected a number of Caribbean countries before making landfall on the Texas coast. (Author)

A81-49656 # **The occurrence of vertical tilt in tropical cyclones.** J. E. Huntley and J. W. Diercks (U.S. Navy, Naval Oceanography Command Center - Joint Typhoon Warning Center, GU). *Monthly Weather Review,* vol. 109, Aug. 1981, p. 1689-1700. 8 refs.

Satellite imagery and aircraft reconnaissance data are presented to show that the tropical cyclones of the western North Pacific often possess significant horizontal displacements between their surface and 700 mb circulation centers during the development stage. Because of the frequency of aircraft reconnaissance during their existence and the range of peak intensities recorded, Super Typhoon Tip, Typhoon Abby and Tropical Depression 01 were selected to illustrate this phenomenon. This observational evidence raises questions as to whether: (1) the displacement between surface and upper level centers are related to the fields of convergence which are necessary to organize and intensify a tropical cyclone, or merely a reaction to upper level shearing flow; and (2) a numerical model initialized with a weak, sloping vortex would spin up to typhoon strength. O.C.

A81-49754 # **Operational use of satellite imagery in the Canadian ice program.** T. F. Mullane (Ice Forecasting Central, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings.
Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 17-32. 7 refs.

The need to provide timely and accurate ice information in support of marine transportation and offshore exploration has increased steadily in recent years. The near real-time reception of NOAA and Landsat imagery provides comprehensive and detailed information on ice conditions. This paper reviews the development and operational use of satellite imagery at Ice Forecasting Central. Imagery acquisition, enhancement, and analysis are considered. The capabilities and limitations of the imagery for the definition of ice features are examined, and developments in automated interpretation processes are presented. B.J.

A81-49771 # **Airborne impulse radar sounding of sea ice.** J. R. Rossiter, K. A. Butt, J. B. Gamberg, and T. F. Ridings (Newfoundland, Memorial University, St. John's, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 187-194. 14 refs. Research supported by the Canadian Marine Drilling, Ltd., Esso Resources Canada, Ltd., and National Research Council of Canada; Department of Supply and Services Contract No. 1SU-78-00347.

Airborne impulse radar, operated from a helicopter and a Twin-Otter, was used in March-April 1979 to estimate the physical properties of sea ice in the Beaufort Sea and Lake Melville, Labrador. Concurrent measurements included: thickness, salinity, temperature, crystal fabric, electrical properties of the ice, simultaneous aerial photography, and synthetic aperture radar imagery. Impulse radar center-frequencies of 80, 100, and 200 MHz appear to give the best trade-off of penetration vs resolution and antenna size. Data collected below 30 m elevation have reduced side-scatter from the ice surface. Speeds below 50 m/s are required with the current hardware to achieve coherence from scan-to-scan. Thickness estimates are excellent for fresh and brackish ice, and are good for underformed first-year sea ice about 1-2 m thick. Areas of fresh water melt pools that have only experienced surface refreezing show thickness profiles that warrant further examination. Bottom returns from multilayer ice are sporadic, although floes up to 14 m have been sounded. Ridges are not usually penetrated, but can be easily detected. (Author)

Pearson (Intera Environmental Consultants, Ltd., Ottawa, Canada), and T. L. Wilkinson (Waterloo, University, Waterloo, Ontario, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 217-229. 19 refs.

Simultaneous 13.3 GHz dual-polarized fanbeam scatterometer data, 19.35 GHz horizontally polarized profiling radiometer data and nadir-looking aerial photography with corresponding X- and L-band SAR (Synthetic Aperture Radar) imagery were collected with the CCRS Convair-580 in March 1979 in the Beaufort Sea and in the eastern Arctic in April 1979. This data set was analyzed to compile statistics on 11 WMO (World Meteorological Organization) classes of sea ice, ranging from calm open water to multiyear ice and ice island. (Author)

A81-49775 # **Radar detection of sea-ice ridges and icebergs in frozen oceans at incidence angles from 0 deg to 90 deg.** D. Pearson (Intera Environmental Consultants, Ltd., Ottawa, Canada), C. E. Livingstone, R. K. Hawkins, A. L. Gray (Canada Centre for Remote Sensing, Ottawa, Canada), L. D. Arsenault (Cold Regions for Remote Sensing, Stittsville, Ontario, Canada), T. L. Wilkinson (Waterloo, University, Waterloo, Ontario, Canada), and K. Okamoto (Ministry of Posts and Telecommunications, Radio Research Laboratories, Tokyo, Japan). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings.
Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 231-241. 5 refs.

Dual-polarized 13.3 GHz scatterometer data and X-band SAR data, collected in the Beaufort Sea and in the eastern Arctic, during the SURSAT sea-ice experiment deployments in March 1979 and April 1979 respectively, have been analyzed to determine the radar contrasts (signal to sea-ice clutter) between sea-ice ridges and the surrounding sea ice in the Beaufort Sea and between icebergs and the surrounding sea ice in the eastern Arctic. The effects of radar resolution cell size on ridge detectability were examined using aerial photography to estimate ridge dimensions. Over the incidence angle range observed, the contrast between ridges and the surrounding sea-ice is nearly independent of incidence angle for all ice types. Cross-polarized radars produce larger ridge contrasts than like-polarized radars, with the largest contrasts and greatest polarization dependence being observed for rough first-year ridges in smooth first-year ice and the smallest contrasts and least polarization dependence being observed for multiyear ridges in multiyear ice. The contrast between icebergs and the first-year ice background is nearly independent of incidence angle over the observed range. Cross-polarized radars enhance iceberg detectability but synthetic aperture radars operated at satellite incidence angles are found to be unsuitable for iceberg detection. (Author)

A81-49776 # **SAR processing of partially coherent and sinusoidally dynamic ocean waves.** R. K. Raney (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 243-247. 6 refs.

The surface of the ocean as observed by a Synthetic Aperture Radar (SAR) evidences both random and deterministic dynamics that have a major impact on the resulting image. This paper explores selected image properties when both effects are present. It is shown that the average response of the SAR is not sensitive to misfocus, whether caused by processor maladjustment or scene dynamics. On the other hand, impulse response and frequency response are critically affected by focus, with a sensitivity that is proportional to the space-bandwidth product of the SAR. Thus, accelerations in a wave scene cannot give rise to wave-like contrasts already present. Orbital motions of surface reflecting wavelets may cause a Doppler shifted image position to occur, which will lead to wave-like contrasts in the image if focus and coherence are maintained. This paper points out that the shift is constant with range for azimuthal waves. In contrast, range dependence occurs in most azimuthal SAR wave imagery. These facts suggest that orbitally derived Doppler shift cannot be the dominant imaging mechanism for oceanic waves. (Author)

A81-49777 # **Digital image analysis of SAR imagery for the detection of icebergs.** W. E. Kirby (Intera Environmental Consultants, Ltd., Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 249-262. 7 refs.

In the spring of 1979, four-channel SAR data sets over iceberg-infested waters were obtained as part of the Sursat program. Portions of this imagery were digitized and analyzed to evaluate the utility of present image processing methods in isolating icebergs and for incorporation into future iceberg prediction models. It is found that: (1) level slicing of the raw data was not suitable for isolating icebergs from the background pack ice, especially in the XHH band; (2) median filtering significantly reduced radar speckle and improved the identification of the icebergs; (3) supervised classification methods resulted in significant data gaps, and were found to be time-consuming; (4) the two-dimensional parallelepiped plots are valuable in assessing the results of the classification procedures; and (5) none of the techniques used could isolate the icebergs from the background pack ice, since the methods function in feature space where the distributions of the spectral intensities determine the classifications. O.C.

A81-49967 * **Regression techniques for oceanographic parameter retrieval using space-borne microwave radiometry.** R. Hofer (Ciba-Geigy AG, Basel, Switzerland) and E. G. Njoku (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *IEEE Transactions on Geoscience and Remote Sensing,* vol. GE-19, Oct. 1981, p. 178-189. 18 refs. Research supported by the U.S. National Academy of Sciences; Contract No. NAS7-100.

Variations of conventional multiple regression techniques are applied to the problem of remote sensing of oceanographic parameters from space. The techniques are specifically adapted to the scanning multichannel microwave radiometer (SMRR) launched on the Seasat and Nimbus 7 satellites to determine ocean surface temperature, wind speed, and atmospheric water content. The retrievals are studied primarily from a theoretical viewpoint, to illustrate the retrieval error structure, the relative importances of different radiometer channels, and the tradeoffs between spatial resolution and retrieval accuracy. Comparisons between regressions using simulated and actual SMMR data are discussed; they show similar behavior. (Author)

REPORTS ON MARINE SCIENCE AFFAIRS. REPORT 14: SATELLITE DATA REQUIREMENTS FOR MARINE METEOROLOGICAL SERVICES
G. D. Hamilton 1980 53 p refs
(WMO-548; ISBN-92-63-10548-0; Rept-14) Avail: NTIS MF A01; print copy available from WMO, Geneva

The applications of satellite data in marine meteorology are reviewed, and the specific requirements for quantitative data gathered by satellite are discussed. The analysis of satellite derived parameters includes surface winds, sea and swell, surface visibility, ice accretion, precipitation, cloud cover, air temperature, humidity, sea surface temperature, surface currents, atmospheric pressure, surf and breakers, storm surge, and sea ice. The availability and access to satellite data for the various marine user groups is examined. A tabular summary of satellites of utility to marine meteorology, their sensors, and observable parameters is provided. Author (ESA)

(ESS/SS-1035; ESA-CR(P)-1433) Avail: NTIS HC A07/MF A01

The individual sensors, launcher (Ariane) and platform are defined. Payloads A and B are described with emphasis on an ocean color monitor, imaging microwave radiometer, synthetic aperture radar and supporting units. Orbits and coverage, configuration options, power and mission profile and data handling are detailed. Satisfaction of payload power remains the most severe problem (for the power subsystem parameters considered) for payload A unless the operating duty cycles are restricted which can be accommodated within the ARIANE shroud. Sufficient mass margin (over 100 kg) exists to allow the inclusion of additional small instruments. These have to operate infrequently or at very low average power to avoid further aggravating the power problem. Wideband type tape recorders (around 5-10 GB

capacity) should be carried to provide reasonable orbit cover. For Payload B, the provisional scatterometer parameters (notably power and data) appear to be very demanding. Consequently, the duty cycles of operation of other instruments have to be severely restricted if the scatterometer operates frequently.

Data obtained by the very high resolution radiometer (VHRR) on the NOAA-5 satellite show thermal contrast due to cold upwelled water which occurs along the coast of Rio de Janeiro State. Coastal station data, VHRR data, and a mathematical model based on Ekman's theory suggest a possible interpretation of mesoscale oceanic phenomena. It is concluded that: (1) when surface winds are from 22.5 deg (true), the thermal VHRR imagery indicates a cool surface plume that extends south of Cabo Frio; (2) when the wind direction increases to 67.5 deg (true) the cool plume changes to a SW direction; and (3) when the wind direction becomes than 135 deg (true), there is no cool water present near the coast.

(PB81-196263) Avail: NTIS HC A99/MF A01 CSCL 08A

Simulation modeling of marine bird population energetics, food consumption, and sensitivity to perturbation was performed. Shorebird dependence on Arctic littoral habitats was studied as well as the distribution, abundance, and feeding ecology of birds associated with pack ice. A study of the population numbers and productivity of colonial seabirds is included. Plankton studies in the Bering Sea and an environmental assessment of selected habitats in the Arctic littoral system are also included. The distribution, abundance, community structure, and trophic relationships of the benthos of the Northeastern Gulf of Alaskan from Yakutat Bay to Cross Sound and the distribution, abundance, diversity, and productivity of the Western Sea benthos were studied.

ICE SHEET ALTIMETRY Final Report
R. L. Brooks Mar. 1981 32 p refs
(Contract NAS6-3117)
(NASA-CR-156877) Avail: NTIS HC A04/MF A01 CSCL 14B

Generalized surface slopes were computed for the Antarctic and Greenland ice sheets by differencing plotted contour levels and dividing them by the distance between the contours. It was observed that more than 90% of the ice sheets have surface slopes less than 1%. Seasat test mode-1 Seasat altimeter measurements over Greenland were analyzed by comparisons with collinear and intersecting normal mode Seasat altimeter passes. Over the ice sheet, the computed surface elevations from test mode-1 measurements were consistently lower by about 45 m and the AGC levels were down by approximately 6 dB. No test mode-1 data were acquired over Antarctica. It is concluded that analysis of the existing altimeter data base over the two ice sheets is crucial in designing a future improved altimeter tracking capability. It is recommended that additional waveform retracking be performed to characterize ice sheet topography as a function of geographic area and elevation.

INTERPRETATION OF HYDROGRAPHIC FEATURES SEEN IN THE WATERS OFF CAPE COD Final Report, M.S. Thesis
Charles Leonard Reed May 1981 193 p refs
(AD-A102343) Avail: NTIS HC A09/MF A01 CSCL 08/10

A study was conducted to determine the origin of features appearing in a LANDSAT image (1724-14472; 17 July 1974) of the waters off Cape Cod by multitemporal and multispectral analysis techniques. Acquisition of ancillary data supplemented imagery from five different sensors, including visible, near infrared, and microwave, representing fifteen discrete times over a five-year period. Digital data for the LANDSAT image was evaluated multispectrally. Various water reflectance models were applied to the digital data to determine whether features related to reflected light from the ocean bottom, turbidity, or surface reflectance. Parameters were estimated from historical data. Results of model calculations were compared with the observed radiances at several locations in the scene. Multitemporal analysis affirmed that the following detailed information can be determined from space imagery: Rapid rates of coastal change, possible uncharted shoals, and theorized surface manifestations of internal waves. In all cases multisensor imagery increased the reliability of the derived information. Multispectral analysis provided additional evidence for attributing variations of reflectance in deep ocean to the effects of surface reflection and also appears to be the primary cause of reflectivity of patterns over the shoal areas around Nantucket Island.

SEA SURFACE SCATTERING

Richard K. Moore *In* ESA Coherent and Incoherent Radar Scattering from Rough Surfaces and Vegetated Areas May 1981 p 53-61 refs

Avail NTIS HC A08/MF A01

Basic mechanisms of sea-surface scattering are described for a two-scale model. The basic concept of Bragg resonance is illustrated with a sinusoidal component of the ocean spectrum. Factors affecting the overall spectrum of ocean waves are listed. Sketches show the geometry associated with using a scatterometer to calculate windspeed in measurements of radar backscatter from the wind driven sea. The model described is quasi-empirical based upon theoretical calculations and measurements with both spacecraft and aircraft. Problems in accurate determination of model parameters are discussed for aircraft and spacecraft. Details are given of research on capillary wave distribution, the satellite altimeter and other non-imaging techniques for determining wave spectra are set out. Unknown quantities including surface expression of bottom topography are mentioned. Author (ESA)

COMPARATIVE ANALYSIS OF SEA ICE FEATURES USING SIDE-LOOKING AIRBORNE RADAR (SLAR) AND LANDSAT IMAGERY Final Report

James C. Barnes and Clinton J. Bowley, Principal Investigators Cleveland NASA. Lewis Research Center Mar. 1981 71 p refs Original contains imagery Original photography may be purchased from the EROS Data Center, Sioux Falls, S.D. 57198 ERTS

(Contract NAS3-21924)

(E81-10044, NASA-CR-165335, P-3970-F) Avail NTIS HC A04/MF A01 CSCL 08L

A comparative analysis of sea ice features was carried out using X-Band, real aperture side-looking airborne radar (SLAR) and LANDSAT imagery. The SLAR data were collected by the NASA/LeRC C-131 aircraft on flights over the Mackenzie Delta and Prudhoe-Barrow areas of the southern Beaufort Sea and the Norton Sound area of the eastern Bering Sea. The LANDSAT data were for dates as near as possible to the dates of the SLAR missions. The analysis of the data sample available for the investigation indicates the SLAR imagery has distinct advantages over LANDSAT for identifying certain features and ice types. It is further indicated that the capability for SLAR observe ice through clouds is essential for an operational ice information system.

DERIVATION OF SHALLOW OCEAN BOTTOM REFLECTANCE VALUES FROM COLOR AERIAL PHOTOGRAPHY

Donald J. Gerson, Lynn K. Fehrenbach, Kenneth R. Piech, and David W. Gaucher Jun. 1981 22 p refs

(AD-A101105) Avail NTIS HC A02/MF A01 CSCL 08/10

An alternative to the field survey method of acquiring hydrographic data is described. The technique involves the use of digitized color aerial photography in the derivation of the percentage of reflectance of shallow ocean bottom materials. These spectral reflectance values can then be used in an algorithm for calculating water depths. The reflectances that were derived in this study show a close relative comparison to ground truth information. After a discussion of the causes of discrepancies between derived and actual reflectance values, it is concluded that this method of data acquisition merits further investigation due to its high geometric fidelity, its simplicity, and its cost and time saving benefits.

HYDROLOGY AND WATER MANAGEMENT

Includes snow cover and water runoff in rivers and glaciers, saline intrusion, drainage analysis, geomorphology of river basins, land uses, and estuarine studies.

A81-41158 # **Determination of moisture from NOAA polar orbiting satellite sounding radiances.** C. M. Hayden, W. L. Smith, and H. M. Woolf (NOAA, National Earth Satellite Service, Madison, WI). *Journal of Applied Meteorology*, vol. 20, Apr. 1981, p. 450-466. 11 refs.

A method is analyzed by which lower troposphere moisture fields can be deduced from radiances measured by satellite. A retrieval technique is described, and the method is evaluated statistically using both synthesized radiances and actual satellite measurements. The TIROS operational vertical sounder (TOVS) measurements made in the 6.7 micron water vapor absorption band are investigated. Three major changes to current operational methods are reported: (1) the surface contribution to the outgoing radiance is subtracted before making temperature and moisture retrievals, allowing a better definition of low-level moisture gradients. (2) The temperature/moisture solution is subjected to a one channel iteration to ensure that the radiative transfer equation is satisfied for low-level moisture, which is beneficial in cases of extreme dryness. (3) In areas of extensive cloud cover, a cloud moisture model is introduced to allow a definition of the atmospheric moisture below the cloud. It was found that the moisture in the surface -700 mb and 850-500 mb layers and particularly the horizontal gradient pattern can be well defined.

A81-41723 # **The use of satellite data in predicting spring flow in the basins of the upper Ob' and upper Enisei (Opyt primeneniia kosmicheskoi informatsii dlia tselei prognoza vesennego stoka v basseinakh rek verkhnei Obi i verkhnego Eniseia).** N. V. Vostriakova. In: Problems of the utilization and protection of the natural resources of Siberia (Problemy ispol'zovaniia i okhrany prirodnykh resursov Sibiri). Novosibirsk, Izdatel'stvo Nauka, 1980, p. 26-30. 7 refs. In Russian.

A81-42095 **Insights into errors of SMS-inferred GATE convective rainfall.** J. A. Augustine, C. G. Griffith, W. L. Woodley (NOAA, Office of Weather Research and Modification, Boulder, CO), and J. G. Meitin (Cooperative Institute for Research in Environmental Sciences, Boulder, CO). *Journal of Applied Meteorology*, vol. 20, May 1981, p. 509-520. 7 refs. NOAA-supported research.

It is noted that, in the mean, the Griffith/Woodley rain estimation technique underestimated the radar-measured rain of each of the three phases of GATE, to varying degrees, and that the satellite-derived rain at the isohyets were generally too extensive relative to radar-measured patterns. Three possible error sources are investigated. They are: (1) the method of apportionment of satellite-derived rain at the surface; (2) resolution degradation of the digital satellite imagery; and (3) anomalous behavior of convective clouds in the tropical Atlantic relative to those of the Florida derivation data set. To correct the satellite-derived rain patterns, a new method of apportionment is tested by recomputing the GATE satellite rain estimates. The relative error caused by resolution degradation is quantified by comparing rain estimates produced from full resolution imagery to estimates derived from degraded imagery for an 8 deg latitude by 12 deg longitude area in the eastern tropical Pacific ocean over a 54 h period. The remaining differences between the GATE satellite and radar estimates are considered to be attributable to different conditions prevailing in Florida and in GATE.

A81-42126 **Satellite detection of seiches in Great Salt Lake, Utah.** M. Matson and C. P. Berg (NOAA, National Earth Satellite Service, Washington, DC). *Water Resources Bulletin*, vol. 17, Feb. 1981, p. 122-128. 21 refs.

On June 15, 1977, an unusual brightness anomaly was detected in the north arm of Great Salt Lake, Utah, on NOAA-5 Very High Resolution Radiometer (VHRR) visible band imagery and on Landsat-2 multispectral visual band imagery. Retrospective inspection of NOAA-3, 4, and 5 satellite imagery from 1974-77 revealed 12 previous cases of the anomaly, whereas post monitoring documented nine other cases through May 1978. Comparison of lake levels in the north arm with meteorological parameters leads to the conclusion that the anomalous brightness is associated with wind induced seiches in the north arm. Apparently the wind induces a lower water depth, turbulence, and mixing throughout the water column in the western third of the north arm, thus increasing the brightness of the surface waters chiefly from sediment resuspension.

A81-42229 * **Simulation modeling of estuarine ecosystems.** R. W. Johnson (NASA, Langley Research Center, Hampton, VA). In: Estuarine and wetland processes. New York, Plenum Publishing Corp., 1980, p. 541-559. 18 refs.

A simulation model has been developed of Galveston Bay, Texas ecosystem. Secondary productivity measured by harvestable species (such as shrimp and fish) is evaluated in terms of man-related and controllable factors, such as quantity and quality of inlet fresh-water and pollutants. This simulation model used information from an existing physical parameters model as well as pertinent biological measurements obtained by conventional sampling techniques. Predicted results from the model compared favorably with those from comparable investigations. In addition, this paper will discuss remotely sensed and conventional measurements in the framework of prospective models that may be used to study estuarine processes and ecosystem productivity.

A81-43176 **Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.** Symposium sponsored by the American Water Resources Association. Edited by M. Deutsch (U.S. Geological Survey, Reston, VA), D. R. Wiesnet (NOAA, Washington, DC), and A. Rango (NASA, Goddard Space Flight Center, Greenbelt, MD). Minneapolis, MN, American Water Resources Association, 1981. 743 p. $85.

Philosophical and technical backgrounds for the application of remote sensing by earth scientists are presented. Interests and activities of participating agencies of the United States and Canadian governments, universities, and the private sector in implementing satellite technology in a diverse array of water-related programs are described. Consideration is then given to applications of satellite data to the various aspects of the hydrologic cycle and man's impact on it: meteorology, snow and ice, surface water, soil moisture, ground water, wetlands, coastal zone, water quality and environment, and water use and management.
B.J.

A81-43177 **Remote sensing in hydrology - A challenge to scientists.** J. S. Cragwall, Jr. (U.S. Geological Survey, Reston, VA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 3-5.

Hydrologic applications of remote sensing by satellites are briefly reviewed. Specific applications discussed include: shallow ground water exploration, inventorying of surface waters, estimation of water withdrawal and consumption, assessment of sea and polar ice conditions, and the relay of hydrologic data to collecting points by satellites. Some of the problems yet to be solved are: better resolution in the thermal infrared and microwave parts of the spectrum, a quick-look capability that can be used for planning purposes, and an improved ability to incorporate land surface features into hydrologic models, which means solving the associated problems of large-scale data storage and processing.
V.L.

A81-43178 **Satellite applications in river and flood forecasting.** R. A. Clark (NOAA, National Weather Service, Silver Spring, MD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 6-8.

Several applications of satellites to river and flood forecasting are described. Areas in which satellites offer a great potential for improved forecasts include areal estimates of snow cover, data relay, improved rainfall estimates in data sparse regions, and better definition of areal variation of soil moisture. (Author)

A81-43179 * **NASA water resources/hydrology remote sensing program in the 1980's.** M. A. Calabrese and P. G. Thome (NASA, Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 9-15. 19 refs.

A81-43180 **Corps of Engineers utilization of satellites for hydrologic purposes.** V. K. Hagen (U.S. Army, Corps of Engineers, Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 16-18.

Activities of the U.S. Army Corps of Engineers in the application of satellites to hydrologic studies are reviewed starting with its initial experiment in 1972. Specific applications discussed include: water control management, runoff estimation, land use, monitoring changes, flooded area identification, and location of important features such as dams and lakes. Most of the current research relates to improved sensors or advanced applications of satellite imagery. V.L.

A81-43182 **A review of Canada's present and future remote sensing activities relating to hydrology.** E. J. Langham (National Hydrology Research Institute, Ottawa, Canada). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 26-32. 12 refs.

The presentation reviews the technical resources in Canada for acquisition and processing remotely sensed data with particular attention to airborne and satellite borne instrumentation, satellite data reception, and data analysis systems used by various agencies. It then goes on to give examples of applications of these data from various subdisciplines of hydrology. (Author)

A81-43183 **Satellite versus conventional methods in hydrology.** D. G. Anderson (U.S. Geological Survey, Reston, VA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 33-36. 21 refs.

Remote sensing applications research efforts are discussed under three broad categories: (1) replace conventional methods with satellite based approaches; (2) combine conventional and satellite data; and (3) emphasize problems unique to solution by the use of satellite data. It is pointed out that most applications of satellite data in each of the three categories require a combination of field observations and related experience for reasonable analysis. Satellite and conventional data tend to be complementary and techniques using both types of data should be considered in hydrologic studies. V.L.

A81-43184 **An introduction to satellite hydrology.** G. K. Moore (U.S. Geological Survey, EROS Data Center, Sioux Falls, SD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 37-41. 5 refs.

A81-43186 **Adapting GOES DCS for use by Corps of Engineers.** T. D. Buckelew (U.S. Army, Corps of Engineers, Waltham, MA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 48-50.

New England Division, Corps of Engineers, working with private industry, has demonstrated a random reporting capability for collecting data using a standard 1500 Hz channel on NOAA's Geostationary Environmental Operational Satellite (GOES). In the random reporting system, hundreds of data collection platforms (DCP's) transmit on a single channel at proper time intervals to ensure an acceptable probability of reception. Several techniques have been incorporated to improve reception probabilities, the main ones being a short message (less than 3 seconds) and an adaptive algorithm programmed into each platform. This algorithm assures sufficient transmission during critical times, yet relieves the system of superfluous messages during normal periods when no new or important information has been generated. The demonstration has confirmed that, even without the adaptive feature, at least 200 platforms will report successfully (with 90 percent probability) within an hour. (Author)

A81-43187 **Satellite telemetry of hydrologic data in California.** C. A. McCullough (California, Dept. of Water Resources, Div. of Flood Management, Sacramento, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 51-53.

Telemetry of hydrologic data in California is beginning to use a satellite as part of the communication path. At present a snow water content sensor and ten precipitation gages report through a satellite. In addition, fire weather data passes through the satellite to aid in suppression of forest and range fires. Large amounts of real-time data are essential to water management and include stream flow, precipitation, wind, snow water content, temperature water quality, and reservoir stage. The present system collects data from about 180 locations, part of which are tied into a computer. Eventually it will process all the data. The emphasis is on real-time data for flood forecasting, water supply forecasting, and water operations. Use of satellites eliminates radio rath problems in mountain terrain and decreases use of mountaintop repeaters that are subject to climatic problems. Changes in the satellite facilities available to us are needed to achieve real-time data acquisition capability. (Author)

A81-43188 **Monitoring Canada's water resources in remote regions by satellite telemetry.** I. A. Reid (Environment Canada, Environmental Management Service, Ottawa, Canada), C. Pesant (Quebec, Ministère des Richesses Naturelles, Direction Générale des Eaux, Quebec, Canada), and B. E. Goodison (Environment Canada, Atmospheric Environment Service, Downsview, Ontario, Canada). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 54-59. 17 refs.

Since 1894 much activity has taken place with respect to monitoring, cataloguing, and managing Canada's inland waters. In 1979, the formal active network of the Water Survey of Canada consists of 2749 stations across Canada. Agencies at both the federal and provincial levels and some publicly owned companies are endeavoring to employ the advantages of telemetry by satellites. The Atmospheric Environment Service (AES) of Environment Canada is becoming actively involved in satellite telemetry to provide better service to the Canadian public. Currently, some 300 meterological and climatological stations provide real-time weather observations during all or part of the day utilizing human resources. Satellite telemetry would provide a less expensive yet reliable means of getting the necessary observations from remote areas. Environmental Management Service (EMS), also part of Environment Canada, joined NASA in an experiment to retransmit hydrometric data by satellite with the launch of Landsat in 1972. At present EMS has 40 Data Collection Platforms deployed across Canada. G.R.

A81-43191 **A satellite derived technique for estimating rainfall from thunderstorms and hurricanes.** R. A. Scofield and V. J. Oliver (NOAA, National Environmental Satellite Service, Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 70-76. 7 refs.

The purpose of this paper is threefold: (1) to summarize the Scofield/Oliver technique for making rainfall estimates from convective systems, (2) to present the results using the technique in real time on major flash flood producing thunderstorms in Mississippi (April 1979) and on Hurricane Anita (September 1977) as the storm advanced into northeastern Mexico, and (3) to discuss some possible reasons why the technique often underestimates the copious rainfall associated with the slow moving remnants of tropical storms. The flash flood producing thunderstorms occurred in Mississippi on April 11-13, 1979. Results showed that the 48-hour estimated heavy rainfall pattern was quite similar to the observed. As Hurricane Anita approached the coastal area, the San Antonio Weather Service Forecast Office (WSFO) was concerned with potential flooding in the Rio Grande basin and in Brownsville, Texas. During the critical time period from September 1-2, 1977, rainfall estimates were provided to the San Antonio WSFO. The results indicated that the rainfall estimates from Hurricane Anita were quite comparable with the ground truth rain gauge measurements. (Author)

A81-43192 **Utilizing GOES imagery to determine convective storm characteristics in data deficient regions.** J. P. Jolly (J. P. Jolly and Associates, Ottawa, Canada). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 77-83.

In many developing countries there is a scarcity of continuous recording precipitation gauges. This hinders or prevents hydrologic analyses for small or medium-sized basins. Using GOES-obtained enhanced infrared imagery and a recently developed technique, which related heights and expansion/contraction characteristics of cumulonimbus clouds to one-half hour rainfall amounts, convective storms were analyzed. The relations between cloud brightness levels on enhanced infrared imageries and one-half hour rainfall amounts were verified using regional recorded daily rainfall totals from which particular storm rainfall characteristics were estimated. (Author)

A81-43193 **Rain estimation over several areas of the globe using satellite imagery.** W. L. Woodley, C. G. Griffith (NOAA, National Hurricane and Experimental Meteorology Laboratory, Coral Gables, FL), and J. A. Augustine (NOAA, Weather Modification Program Office, Boulder, CO). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.

Minneapolis, MN, American Water Resources Association, 1981, p. 84-91. 7 refs. NOAA-supported research; U.S. Bureau of Reclamation Contract No. 8-07-83-V0016.

A computer-automated technique to estimate rainfall using digital, infrared geosynchronous satellite imagery has been developed and tested. The method requires time histories of convective entities at discrete temperature thresholds and a set of empirical relationships. Development of tracking software and access to a large computer now permit rain estimates for large (10-million sq km) areas down to individual clouds. Rain estimates for several areas of the globe (Florida, the tropical Atlantic Ocean and western Africa, the eastern tropical Pacific Ocean and tropical South America, two flash flood situations, and the U.S. High Plains) are presented. The satellite-inferred rainfalls are compared to ground truth when available. (Author)

A81-43197 * **Modeling the terrestrial hydrology for the global atmosphere - The future role of satellite data.** J. D. Lin, P. Bock, and J. J. Alfano (Connecticut, University, Storrs, CT). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 124-138. 14 refs. Grant No. NsG-5075.

A global terrestrial hydrology model has been developed for the transport and storage of moisture and heat in the ground surface layer where the hydrological parameters react to diurnal and seasonal changes in the atmosphere. The spatial and temporal variability of land surface features is considered in the model by means of large scale parameterizations. The model can be either forced by the atmosphere using conventional meteorological data or coupled to an atmospheric general circulation model (GCM) for interactive studies. The global surface is divided into 4 deg longitude by 5 deg latitude cells while the ground is represented by a thin surface layer, a bulk layer (the root zone), and a deep layer (the ground water zone). Results are presented from a seven-day global experiment which was conducted utilizing the GLAS GCM (NASA Goddard Laboratory for Atmospheric Sciences). The model has demonstrated its capability to predict, over a large region, the overall soil moisture storage and major flux exchanges with the atmosphere above and the ground water below. (Author)

A81-43198 **A statistical approach to rainfall estimation using satellite data.** L. F. Whitney, Jr. and L. D. Herman (NOAA, National Environmental Satellite Service, Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 139-143. 6 refs.

A statistical approach is used in an attempt to estimate convective rainfall using satellite data. The objective is to furnish rainfall estimates in a form suitable as input to hydrologic models which forecast river flow. These models require area-averaged rainfall over periods of 6 hours in watersheds covering 500 or more square miles. It is noted that from among the variables used, a screening regression method selected those which best explain area-averaged rainfall. In both cases studied, the selected variables correlate with rainfall at above 0.8. However, since meteorological conditions in each case were very different, neither regression equation was a good estimator of the rainfall in the other case. Some of the most important variables selected are IR-temperature gradients along the tropospheric shear, ratio of IR-temperature to IR-temperature gradient along the low-level wind, low-level dewpoint, low-level dewpoint gradient along the high-level wind, and low-level dewpoint advection. It is noted that although these preliminary results are encouraging, many more cases must be included and any positive results checked against independent data. C.R.

A81-43199 **Roles of satellites in hydrology.** D. G. Anderson (U.S. Geological Survey, Reston, VA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 144-155. 26 refs.

The usefulness of satellite data in hydrologic applications is demonstrated by examples involving three areas (Arctic region; Ouachita River, Arkansas/Louisiana; and Albemarle-Pamlico Sounds, North Carolina). The data used included data from four satellite systems (Apollo, Landsat, Nimbus, and Heat Capacity Mapping Mission), covering the visible, thermal, and infrared bands and ranging in resolution from 30 m to 50 km. It is shown that data from satellites, if analyzed at the initial stage of a hydrologic study, can provide valuable conceptual information on the hydrologic systems involved. V.L.

A81-43200 **Satellite snow mapping techniques with emphasis on the use of Landsat.** C. J. Bowley and J. C. Barnes (Environmental Research and Technology, Inc., Concord, MA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 158-164. 18 refs.

The types of satellite data that have been used to map snow cover and the interpretative techniques that have evolved are reviewed with emphasis on the application of snow covered areas from Landsat to runoff prediction. It is pointed out that the experience of the data interpreter is highly valuable in estimating snow covered area during partial cloud cover conditions, and when interpreting snow cover in areas of heavy forest cover, mountain shadows, and bare rock terrain. The application of remote sensing in portions of the spectrum other than the visible is also discussed. V.L.

A81-43201 **Application of snow covered area to runoff forecasting, in the Sierra Nevada, California.** J. F. Hamnaford and A. J. Brown (California, Dept. of Water Resources, Snow Surveys Branch, Sacramento, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.
Minneapolis, MN, American Water Resources Association, 1981, p. 165-172.

Results of a four-year project to explore the application of snow covered area (SCA) obtained from satellite imagery to hydrologic forecasting are summarized. Data describing SCA are found to have greatest hydrologic application during the period of snow melt in the spring and early summer rather than during the period of snow pack accumulation. SCA provides the source of near real-time data from within the watershed during a period when snow pack conditions are changing rapidly and snow melt runoff rates are high. SCA data may be most useful for detection and monitoring of conditions within the basin that depart from natural or experienced conditions. V.L.

A81-43202 **Satellite Image Atlas of the earth's glaciers.** R. S. Williams, Jr. and J. G. Ferrigno (U.S. Geological Survey, Reston, VA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 173-182. 24 refs.

In June 1977, a project was initiated to prepare a 'Satellite Image Atlas of Glaciers'. It is pointed out that there exist sufficient Landsat, NOAA, and other satellite data in various archives for this project. The preparation of such an atlas is considered a timely effort because of the wide variety of impending and ongoing U.S. and international climatological studies. The primary objective of the atlas is to provide a pictorial inventory either in the form of a Landsat or other satellite image, or as a tabular listing of the best available Landsat or other satellite images of extant glaciers. Such an atlas should provide a means of obtaining a better estimate of the total area of the planet covered by glaciers. Attention is given to image selection, the contents of the atlas, the Antarctic ice sheet, Iceland, and Svalbard.

G.R.

A81-43203 **The satellite record of the winter of 1978-79 in North America.** D. R. Wiesnet and C. P. Berg (NOAA, National Environmental Satellite Service, Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 183-187. 9 refs.

The satellite record of the winter 1978-79 is reviewed to demonstrate the utility of NOAA/NESS (National Oceanic and Atmospheric Administration/National Environment Satellite Service) satellite data to record snow cover on a continental basis, which is a good measure of winter's severity. Results examined in the light of a 13-year record show a clear trend toward increased winter snow cover. It is also shown that the severity of the 1978-79 North American winter, as measured by satellite-determined snow cover, was a regional rather than a hemispheric or global phenomenon.

V.L.

A81-43204 **Potentials of mapping buried glacier ice with Landsat thermal imagery.** R. Lougeay (New York, State University, Geneseo, NY). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 189-192. 5 refs. Research supported by the State University of New York Research Foundation.

Field observations and the analysis of Landsat imagery of the Wrangell Mountains of Alaska provide information on the nature and extent of buried glacier ice. Spectral bands 5, 7, and false color composite imagery from existing Landsat multispectral data proved most useful for mapping glacial margins and large masses of active but buried glacier ice. Signal contrasts between bare detritus and vegetation cover were most strongly pronounced on band 5, while band 7 displayed stronger contrasts between the microtopographic texture of the moraine covered ice masses and adjacent etrital surfaces of talus or outwash. When the mantle of morainic detritus is thinner than the diurnal thermal damping depths, strong signal contrasts between ice cored moraines and dry glacial drift deposits are present.

B.J.

A81-43205 **Prediction of water yield using satellite imagery and a snowmelt simulation model.** W. O. Rasmussen and P. F. Ffolliott (Arizona, University, Tucson, AZ). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 193-196. 14 refs.

A computer simulation model has been developed for estimating the impacts of alternate land management activities on winter water yield in snow covered areas. The model uses satellite imagery to delineate the areal extent of the snow covered area near peak snow-pack accumulation. A degree-day snowmelt technique is used to predict daily melt, with daily stream flow being computed from recession analysis. The model has been structured in an interactive format to facilitate operation by users at remote locations using readily available data sets.

A81-43207 * **Passive microwave sensing of snow characteristics over land.** A. T. C. Chang, D. K. Hall, J. L. Foster, A. Rango, and J. C. Shiue (NASA, Goddard Space Flight Center, Application Directorate, Greenbelt, MD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 213-217. 11 refs.

Truck-mounted, airborne, and spaceborne systems with various radiometers ranging in wavelength from 0.8 to 21 cm were used to measure the brightness temperatures of snow-covered areas at test sites near Steamboat Springs and Walden, Colorado. The brightness temperature at a short wavelength (0.8 cm) was found to decrease more rapidly with increasing snow depth than the brightness temperature at a longer wavelength (6 cm). More scattering of the shorter-wavelength radiation by the snow crystals results in a lower brightness temperature. The longer-wavelength (6 cm) radiation penetrates through meters of dry snowpack and is useful for the assessment of the underlying ground conditions. B.J.

A81-43208 **Landsat derived snow cover as an input variable for snow melt runoff forecasting in South Central Colorado.** B. A. Shafer (Soil Conservation Service, Denver, CO), J. K. Marron (Soil Conservation Service, Arvada, CO), and C. F. Leaf. In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 218-224. 5 refs.

Landsat imagery for the period 1973-78 was used to calculate snow covered area on six drainages in South Central Colorado. Snow covered area was used as a predictor variable to forecast both short-term and seasonal snow melt runoff volumes. The Leaf-Brink Subalpine Water Balance simulation model was adapted to use snow covered area as an input parameter to predict residual volume runoff. Areal snow cover was also used in a statistical model to forecast runoff and is compared to current water equivalent index methods of forecasting. Results indicate that Landsat derived snow cover is highly correlated with seasonal stream flow volumes. Snow cover extent is an important variable for forecast purposes once the main snow melt season begins but is of limited value before that time.

A81-43209 * **Monitoring snow with microwaves.** W. H. Stiles and F. T. Ulaby (University of Kansas Center for Research, Inc., Lawrence, KS). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 225-229. Contract No. NAS5-23777.

Results of an experimental study concerned with the active and passive microwave response to snow pack are discussed. Comprehensive ground truth measurements and preliminary investigations indicate that the primary factors affecting the microwave response are snow water equivalent and snow wetness. The most important conclusion of the study is that the scattering and emission behavior of snow varies drastically as a function of frequency between 1 GHz and 37 GHz, which suggests that the multifrequency operation has the potential to provide estimates on several snow parameters, primarily wetness profile and water equivalent, simultaneously. V.L.

A81-43210 **Operational use of satellite data for snow inventory and runoff forecast.** G. Ostrem, T. Andersen (Norges Vassdrags- og Elektrisitetsvesen, Oslo, Norway), and H. Odegaard (IBM Norway, Oslo, Norway). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 230-234. 8 refs. Research supported by the Norges Vassdrags- og

Elektrisitetsvesen and Norges Teknisk-Naturvitenskapelige Forskningsrad.

A method has been developed whereby NOAA and TIROS data are used to evaluate remaining snow in mountain watersheds and to predict the corresponding melt water volume. The method can only be used in vegetation free or almost vegetation free high mountain basins and only during the snow melt period after some 20% of the landscape has become snow free. The relation between the remaining snow cover (as expressed in per cent or in square km) and the subsequent melt water inflow is determined empirically. The method has been used for monitoring water reservoirs in southern Norway but can be also used in other areas. V.L.

A81-43211 * **The use of radar imagery for surface water investigations.** M. L. Bryan (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 238-251. 28 refs. Contract No. NAS7-100.

The paper is concerned with the interpretation of hydrologic features using L-band (HH) imagery collected by aircraft and Seasat systems. Areas of research needed to more precisely define the accuracy and repeatability of measurements related to the conditions of surfaces and boundaries of fresh water bodies are identified. These include: the definition of shoreline, the nature of variations in surface roughness across a water body and along streams and lake shores, and the separation of ambiguous conditions which appear similar to lakes. V.L.

A81-43212 **An examination of fluvial morphological characteristics of western Amazon streams from Apollo-Soyuz photographs.** R. K. Holz and V. R. Baker (Texas, University, Austin, TX). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 252-259. 9 refs.

Empirical formulas are tested in estimating the hydrologic properties of certain South American rivers. The study reveals the lack of precise understanding of regime behavior in tropical streams and the difficulty of transferring the results of research on humid midlatitude and semiarid midlatitude streams to those of the humid tropical areas. The results show that the low sinuosity Amazon Basin streams transport much finer sediment than do streams of equivalent sinuosity previously described for semiarid regions. Many of the fluvial complexities of the western Amazon Basin are seen as resulting from the relative abilities of different rivers to rework coarse, relict alluvium that was deposited during the relatively arid full-glacial phases of the Pleistocene. C.R.

A81-43213 **Hydrologic land use classification using Landsat.** R. J. Cermak, A. Feldman, and R. P. Webb (U.S. Army, Hydrologic Engineering Center, Davis, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 262-269. 8 refs.

Experience with land use classification from Landsat multispectral imagery is described. Land use is required for the estimation of hydrologic model parameters. The land use classification procedure used is an unsupervised, noninteractive approach requiring no special image processing equipment. Watershed land use was determined from Landsat digital data, entered into a geographic data bank, and compared with a conventional land use classification. Hydrologic simulation model parameters were estimated from land use and other basin characteristics. The generated discharge frequency curves, corresponding to the alternative land use classifications, permitted the hydrologic significance of accuracy in land use identification to be assessed. (Author)

A81-43214 **Landsat data for regulatory permit monitoring.** A. N. Williamson (U.S. Army, Engineer Waterways Experiment Station, Vicksburg, MS). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 270-277.

The U.S. Army Corps of Engineers Regulatory Permit Program for activities in navigable inland or ocean waters was revised in July 1975. The major impact of the revisions is the requirement for a Department of the Army permit for the water disposal of dredged or fill material in virtually every water body in the U.S. The immensity of these requirements dictated that methods must be found that would provide a cost-effective way to detect and periodically monitor activities requiring permits. One candidate for this application was the Landsat satellite. The multispectral scanner (MSS) on board the satellite could provide relatively inexpensive and repetitive coverage of large areas of terrain on a regular basis. However, there were some questions regarding the ability of the MSS to resolve small terrain features, the applicability of currently available automatic data processing techniques and the cost of using Landsat MSS data for monitoring activities. An investigation of the various factors is discussed. Given an understanding of certain limitations concerning the acquired data, an interpreter can extract from a Landsat-derived image information that is valuable from the standpoint of the Regulatory Permit Program. G.R.

A81-43216 **Improving stream flow estimates through the use of Landsat.** G. J. Allord (U.S. Geological Survey, Water Resources Div., Madison, WI) and F. L. Scarpace (Wisconsin, University, Madison, WI). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 284-291. 7 refs.

Using new estimates of land cover in multiple regression techniques, the standard error of estimate (SE) for the least annual 7-day low flow for 2- and 10-year recurrence intervals of ungaged sites are lowered by 9 percent each. The SE of flood frequency in the 'Driftless Area' of Wisconsin for 10-, 50-, and 100-year recurrence intervals are lowered by 14 percent. Four of nine basin characteristics determined from satellite imagery are significant variables in the multiple regression techniques, whereas only 1 of the 12 characteristics determined from topographic maps is significant. The percentages of land cover categories in each basin are determined by merging basin boundaries, digitized from quadrangles, with a classified Landsat scene. Both the basin boundary X-Y polygon coordinates and the satellite coordinates are converted to latitude-longitude for merging compatibility. C.R.

A81-43217 **Flood applications of satellite imagery.** J. Kruus, H. L. Ferguson (Environment Canada, Atmospheric Environment Service, Ottawa, Canada), M. Deutsch (U.S. Geological Survey, Reston, VA), and P. L. Hansen (New Brunswick, Dept. of the Environment, Fredericton, Canada). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 292-301. 7 refs.

Various techniques that can be used to derive information relevant to floods from satellite imagery are illustrated. Multistage sampling makes use of Landsat images and aerial photography at various scales to outline flood damage from a regional scale to single fields. It is noted that multispectral composites may be made to enhance such features as standing water or floodplain indicators for measurement of photointerpretation. Temporal composites are useful in comparing flood levels on various dates or, if one of the images shows the normal stage, in measuring flooded area. It is noted that digital mapping methods may also be used in detecting, mapping, and measuring the area covered by water at various stages for derivation of a stage storage curve. C.R.

A81-43218 **A note on indirect detection of seiches in Great Salt Lake, Utah, by NOAA and Landsat satellite imagery.** M. Matson, C. P. Berg, and D. R. Wiesnet (NOAA, National Earth Satellite Service, Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 303-307. 5 refs.

On June 15, 1977, an unusual reflectance anomaly was detected in the north arm of Great Salt Lake, Utah, on NOAA-5 Very High Resolution Radiometer (VHRR) visible band imagery, and later on

Landsat-2 multispectral visual band imagery. Comparison of north arm lake levels with meteorological parameters leads to the conclusion that the anomalous reflectance is associated with wind induced seiches in the north arm. Apparently, the wind induces anomalous current patterns and higher than usual current speeds and waves in the western part of the north arm; these currents and waves then entrain the fine grained sediments of the shallow lake bottom, thus increasing the turbidity and hence the reflectance of surface waters. (Author)

A81-43219 Assessing the Red River of the North 1978 flooding from NOAA satellite data. C. P. Berg, D. R. Wiesnet, and M. Matson (NOAA, National Earth Satellite Service, Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 309-315. 5 refs.

Thermal infrared (IR) Very High Resolution Radiometer (VHRR) data from the polar-orbiting NOAA-5 satellite are used to map the spring 1978 flooding on the Red River of the North. The twice-daily VHRR-IR coverage provides good flood extent mapping capability for small rivers having broad flood plains such as the Red River of the North (basin area 101,519 square kilometers). Flood extent is delineated using computer-enhanced, enlarged thermal IR images mapped onto 1:1,000,000 base maps and compared to ground-based hydrologic data. The resulting maps show the flood-inundated areas and the changes that occur as the flood proceeds downstream. (Author)

A81-43220 A preliminary analysis of SAR mapping of the Manitoba flood, May 1979. R. T. Lowry (Intera Environmental Consultants, Ltd., Ottawa, Canada), N. Mudry (Manitoba, Dept. of Mines, Natural Resources and Environment, Winnipeg, Canada), and E. J. Langham. In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 316-323.

A preliminary evaluation is presented of SAR imagery obtained of the flooding of the Red River in Manitoba in May, 1979 as part of the Sursat Program to determine Canadian needs for a surveillance satellite and the appropriate sensors to be used to meet those needs. The area of the flooding was mapped with an airborne synthetic aperture radar based on the ERIM four-channel SAR which consists of two dual polarized radars operating in the L and X bands, which was operated in the steep mode to simulate satellite observations. The imagery was processed to obtain maps of 1:250,000 and 1:500,000 scale which can be used to establish the actual extent of the flooding. The X-band is found to provide a better image, in part due to its higher resolution and shorter wavelength. Results demonstrate that an airborne SAR can provide all-weather flood area delineation, although satellite-borne radar, with steep depression angles, lower resolution and lower frequency, may not be able to delineate floods without special image processing. A.L.W.

A81-43226 Ground water and satellites - An overview/introduction. W. A. Pettyjohn (Oklahoma State University, Stillwater, OK). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 385, 386.

Remote sensing reports have improved dramatically in the past few years because of highly sophisticated automatic data processing. Unfortunately, much of the information is of limited practical value to local, state, or federal agencies, as well as other potential users. Satellite data, in several disciplines, has been less than satisfactory, not because it isn't suited to a specific application, but rather because so few use it. This is the result of poor communication, which can be overcome, in part, by publishing our findings more widely and by producing applications oriented, readable reports. (Author)

A81-43229 Hydrogeologic interpretations of Landsat imagery in arid zones of South and West Africa. W. Kruck (Bundesanstalt für Geowissenschaften und Rohstoffe, Hanover, West Germany). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 408-415. 8 refs.

A81-43231 Observations on Lake Ontario basin hydrogeology from optical enhancements of Landsat imagery. A. Falconer, L. Myers (Library of Parliament, Ottawa, Canada), and M. Deutsch (U.S. Geological Survey, Reston, VA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 427-436. 8 refs. U.S. Geological Survey Contracts No. 14-08-0001-13169; No. 14-08-0001-3185.

Before the close of the International Hydrological Decade (IHD), the launch of Landsat 1 in 1972 made possible the collection and analysis of satellite images showing the entire Lake Ontario drainage basin. An assessment was made of Landsat imagery and prelaunch aircraft analog data to determine their usefulness in assisting IHD investigators to define the regional hydrological characteristics of the basin. By using a composite of July data from MSS bands 4, 5, and 7, reprocessing of standard EDC products leads to the production of a low-cost detailed synoptic view of vegetation distribution and land use in the Lake Ontario basin. A temporal series of two scene Landsat mosaics of the western Lake Ontario region provide an information base for interpreting hydrological conditions from snow distribution, ice melting patterns, and vegetation anomalies indicative of ground water discharge or the presence of shallow aquifers. B.J.

A81-43233 * Ground water applications of the heat capacity mapping mission. J. L. Heilman (Texas A & M University, College Station, TX) and D. G. Moore (South Dakota State University, Brookings, SD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 446-449. U.S. Geological Survey Contract No. 14-08-0001-12510; Contract No. NAS5-24206.

The paper discusses the ground water portion of a hydrologic investigation of eastern South Dakota using data from the Heat Capacity Mapping Mission (HCMM) satellite. The satellite carries a two-channel radiometer (0.5-1.1 and 10.5-12.5 microns) in a sun synchronous orbit and collects data at approximately 0230 and 1330 local standard time with repeat coverage of 5 to 16 days depending on latitude. It is shown that HCMM data acquired at appropriate periods of the diurnal and annual temperature cycle can provide useful information on shallow ground water. V.L.

A81-43234 * Landsat classification of coastal wetlands in Texas. R. J. Finley (Texas, University, Austin, TX), S. McCulloch (Texas Natural Resources Information System, Austin, TX), and P. Harwood (National Governor's Association, Council of State Planning Agencies, Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 453-462. 15 refs. Contract No. NAS5-20986.

Through a multiagency study of Landsat imagery applications, an analysis of Texas coastal wetlands shows that five Level III categories of wetlands can be delineated using image interpretation: topographically low marshes, topographically high marshes, tidal flats, sea grass and algal flats, and vegetated dredged material. Image interpretation involves optical enlargement of 1:1,000,000 scale, Landsat transparencies to a scale of 1:125,000 and mapping on a stable film base. Digital classification procedures, resulting in 1:24,000 scale line printer maps as output, require several iterations to display welands effectively. Accuracies of 65% were achieved for all wetland categories combined. B.J.

A81-43235 Accuracy evaluation of Landsat digital classification of vegetation in the Great Dismal Swamp. P. T. Gammon (U.S. Geological Survey, Suffolk, VA), W. G. Rohde (U.S. Geological Survey, EROS Data Center, Sioux Falls, SD), and V. Carter (U.S. Geological Survey, Reston, VA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.

Minneapolis, MN, American Water Resources Association, 1981, p. 463-473. 9 refs.

A81-43236 * **Using Landsat MSS data with soils information to identify wetland habitats.** C. L. Ernst and R. M. Hoffer (Purdue University, Lafayette, IN). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.
Minneapolis, MN, American Water Resources Association, 1981, p. 474-478. 6 refs. Grant No. NGL-15-005-186.

A previous study showed that certain fresh water wetland vegetation types can be spectrally separated when a maximum likelihood classification procedure is applied to Landsat spectral data. However, wetland and upland types which have similar vegetative life forms (e.g., upland hardwoods and hardwood swamps) are often confused because of spectral similarity. Therefore, the current investigation attempts to differentiate similar wetland and upland types by combining Landsat multispectral scanner (MSS) data with soils information. The Pigeon River area in northern Indiana used in the earlier study was also employed in this investigation. A layered classification algorithm which combined soils and spectral data was used to generate a wetland classification. The results of the spectral/soils wetland classification are compared to the previous classification that had been based on spectral data alone. The results indicate wetland habitat mapping can be improved by combining soils and other ancillary data with Landsat spectral data. (Author)

A81-43237 * **Improvements in lake volume predictions using Landsat data.** J. C. Gervin (NASA, Goddard Space Flight Center, Greenbelt, MD) and S. F. Shih (Florida, University, Belle Glade, FL) In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 479-484. NASA-supported research.

A cumulative error in the water balance budget for Lake Okeechobee produces a one million acre-foot discrepancy in the predicted water volume over a 4-year period. The major source of error appears to be complex shoreline marshes that comprise 20 percent of the lake surface. The water balance budget model presently treats these marshes as open water. Using Landsat data, the vegetation in the lake's littoral zone was classified multispectrally to provide a data base for determining water budget information. First, the acreage of a given plant species in the littoral zone was obtained with satellite data. Second, the surface area occupied by plants (which therefore could not be considered open water) was used to adjust the vegetation acreage giving an effective water surface. Based on this information, more detailed representations of evapotranspiration and total water surface (and hence total lake volume) could be provided to the water balance budget computation. (Author)

A81-43238 * **Landsat hydrobiological classification for an inland fresh water marsh within Everglades National Park.** P. W. Rose and P. C. Rosendahl (U.S. National Park Service, South Florida Research Center, Homestead, FL). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.
Minneapolis, MN, American Water Resources Association, 1981, p. 485-491. NASA-supported research.

The considered investigation is concerned with the application of Landsat Multispectral Scanner (MSS) data to the classification of vegetative communities and the establishment of flow vectors for the Shark River Slough in Everglades National Park, Florida. A systematic array of 'ground truth' was established utilizing comprehensive hydrologic field data and conventional high altitude infrared aerial photography. A control network was defined that represented all hydrobiological zones (those wetland vegetative communities that directly influence the rate of overland sheet flow) in the Shark River Slough. These data were then directly applied to the Landsat imagery utilizing an interactive multispectral processor which generated hydrographic maps of the slough and defined the surface radiance characteristics of each hydrobiological system. It was found that the application of Landsat imagery for hydrologic applications in a wetlands area, such as the Shark River Slough in Everglades National Park, is definitely a viable tool for resource management. G.R.

A81-43239 * **A comparison of remote sensing techniques for Minnesota wetlands classification.** L. F. Werth (Lockheed Electronics Co., Inc., Houston, TX) and M. P. Meyer (Minnesota, University, St. Paul, MN). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.
Minneapolis, MN, American Water Resources Association, 1981, p. 492-498. 8 refs. Research supported by the University of Minnesota and NASA.

A wetland classification study in a typically complex 650 sq km test site in east central Minnesota compared the time, cost and accuracy of manually interpreted 1:24,000 scale color infrared aerial photographs with digital analysis of Landsat data. The comparison was between the same general wetland and non-wetland classes; accuracy of both systems was evaluated with intensive ground verification. For the same general classes, the overall mapping accuracy was 96 percent for the aerial photo interpretation and 71 percent for Landsat double-date classification. Results with maximum likelihood and SECHO classifiers were the same, 71 percent while mapping accuracy with a layered classifier was only 66 percent. Compared to a general geometric correction and a single-date data set, geographic position and classification accuracy improved when a precision geometric correction and a double-date data set were used. Landsat digital analysis was faster, 24 vs. 90 days, but photointerpretation was more economical at $0.15/hectare (including all costs of procurement, processing and analysis), compared with Landsat costs of $0.35/hectare (not including costs of data procurement, processing prior to delivery to user and related overhead). (Author)

A81-43240 **Landsat interpretation of prairie lakes and wetlands of eastern South Dakota.** R. G. Best and D. G. Moore (South Dakota State University, Brookings, SD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 499-506. 15 refs. U.S. Geological Survey Contract No. 14-08-0001-13576.

Spectral and morphometric properties of prairie lakes and wetlands can be interpreted on Landsat MSS imagery. Multispectral interpretations for developing water quality sampling strategies are discussed and illustrated. Photographic enhancement techniques including contrast enhancement to depict qualitative turbidity differences, thematic extraction of open water bodies, and temporal compositing for determining the occurrence and distribution of emergent vegetation are presented and illustrated. The statistical accuracy of morphometric measurements, including area length, breadth, mean breadth, and shoreline development index were calculated. Models for estimating average depth and volume were developed and evaluated. (Author)

A81-43241 * **A technique for improved assessment of flow resistance characteristics of natural wetlands using Landsat data.** J. C. Gervin (NASA, Goddard Space Flight Center, Greenbelt, MD) and S. F. Snih (Florida, University, Bell Glade, FL). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.
Minneapolis, MN, American Water Resources Association, 1981, p. 507-511. NASA-supported research.

In the past, one value of the roughness coefficient has frequently been used to represent the flow resistance characteristics of the entire natural wetland throughout the year. To improve the simulation of water flow through these natural vegetation communities, Landsat imagery and in situ flow measurements could be combined to produce a more detailed representation of flow resistance. The vegetation in a typical marshland drainage basin in south Florida was classified into five major categories using Landsat data. Flow measurements were then performed at characteristic sites in the basin. The measurements were taken at various depths during months of significant flow to examine the effect of seasonal growth. This information can be compared with the areal extent of the vegetation measured by satellite to more accurately simulate resistance to water flow in natural marshland drainage basins. (Author)

A81-43242 **Using Landsat imagery to study the Okavango Swamp, Botswana.** S. M. Hutton and T. Dincer. In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora

Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 512-519. 20 refs.

A81-43243 * **Computer-implemented remote sensing techniques for measuring coastal productivity and nutrient transport systems.** M. K. Butera (NASA, Earth Resources Laboratory, Bay St. Louis, MS). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 522-532. 21 refs.

An automatic technique has been developed to measure marsh plant production by inference from a species classification derived from Landsat MSS data. A separate computer technique has been developed to calculate the transport path length of detritus and nutrients from their point of origin in the marsh to the shoreline from Landsat data. A nutrient availability indicator, the ratio of production to transport path length, was derived for each marsh-identified Landsat cell. The use of a data base compatible with the Landsat format facilitated data handling and computations. (Author)

A81-43249 * **Applications of Landsat imagery to a coastal inlet stability study.** Y.-H. Wang (Texas A & M University, Galveston, TX). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 579-584. 6 refs. NASA-sponsored research.

Polcyn and Lyzenga (1975) and Middleton and Barber (1976) have demonstrated that it is possible to correlate the radiance values of a multispectral imagery, such as Landsat imagery, with the depth related information. The present study is one more example of such an effort. Two sets of Landsat magnetic tape were obtained and displayed on the screen of an Image-100 computer. Spectral analysis was performed to produce various signatures, their extent, and location. Subsequent ground truth observations and measurements were gathered by means of hydrographic surveys and low altitude aerial photographs for interpretation and calibration of the Landsat data. Finally, a coastal engineering assessment based on the Landsat data was made. Recommendations regarding the navigational canal alignment and dredging practice are presented in the light of inlet stability. (Author)

A81-43252 **Using enhanced Landsat images for calibrating real time estuarine water quality models.** J. M. Hill (Louisiana State University, Baton Rouge, LA) and D. S. Graham (Tudor Engineering Co., San Francisco, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.
Minneapolis, MN, American Water Resources Association, 1981, p. 603-614. 20 refs. Research supported by the U.S. Environmental Protection Agency; Grant No. NOAA-04-158-44046.

A study of the effects of silvicultural activities and associated channelization upon the quality of the receiving waters of Apalachicola Bay in north Florida is utilizing Landsat images and data to verify real time estuarine water quality models. Management of estuarine water resources requires that accurate mathematical paradigms of circulation and quality be made in order to evaluate the effects of different alternative scenarios. For such paradigms to be predictive in estuaries, it has been demonstrated that they must be in so called 'real time' in which the timestep is much shorter than the tidal period. Verification of such models requires good synoptic data. These are usually impossible to acquire as the time required to traverse the estuary by boats results in measurements being taken over most of the tidal cycle, while continuous observations taken at fixed points provide inadequate spatial resolution at practical staffing levels. Circulation patterns in several specially enhanced Landsat images show good comparison to output of finite element two-dimensional (2-D) vertically averaged models of Apalachicola Bay, hence, information can be applied to both calibrate and verify estuarine water quality models. (Author)

A81-43253 * **An application of Landsat and computer technology to potential water pollution from soil erosion.** W. J. Campbell (NASA, Goddard Space Flight Center, Greenbelt, MD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 616-621. 5 refs.

Agricultural activity has been recognized as the primary source of nonpoint source water pollution. Water quality planners have needed information that is timely, accurate, easily reproducible, and relatively inexpensive to utilize to implement 'Best Management Practices' for water quality. In this paper, a case study shows how the combination of satellite data, which can give accurate land-cover/land-use information, and a computerized geographic information system, can assess nonpoint pollution at a regional scale and be cost effective. (Author)

A81-43254 * **Bay of Fundy verification of a system for multidate Landsat measurement of suspended sediment.** J. C. Munday, Jr. (Virginia Institute of Marine Science; College of William and Mary, Gloucester Point, VA), T. T. Afoldi (Canada Centre for Remote Sensing, Ottawa, Canada), and C. L. Amos (Geologic Survey of Canada, Bedford Institute of Oceanography, Dartmouth, Nova Scotia, Canada). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 622-640. 39 refs. Grant No. NGL-47-022-005.

A system for automated multidate Landsat CCT MSS measurement of suspended sediment concentration (S) has been implemented and verified on nine sets (108 points) of data from the Bay of Fundy, Canada. The system employs 'chromaticity analysis' to provide automatic pixel-by-pixel adjustment of atmospheric variations, permitting reference calibration data from one or several dates to be spatially and temporally extrapolated to other regions and to other dates. For verification, each data set was used in turn as test data against the remainder as a calibration set: the average absolute error was 44 percent of S over the range 1-1000 mg/l. The system can be used to measure chlorophyll (in the absence of atmospheric variations), Secchi disk depth, and turbidity. (Author)

A81-43255 **Assessment and classifications of selected Illinois lakes through the application of space technology.** D. J. Schaeffer, R. P. Clarke, D. F. Sefton (Illinois Environmental Protection Agency, Springfield, IL), and D. H. P. Boland (USAF, Wright-Patterson AFB, OH). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979.
Minneapolis, MN, American Water Resources Association, 1981, p. 641-648. 8 refs.

Selected Illinois lakes were assessed and classified by: (1) applying a complete linkage clustering algorithm to Landsat MSS data and interpreting the clusters by comparing the spectral composition and uniqueness of each with water quality data, field evaluations, lake morphology, and watershed characteristics; and (2) using Landsat spectral ranks as independent variables and contact-sensed data as dependent variables for the development of multiple regression models to obtain estimates of trophic indicator parameters and multivariate trophic indices and, subsequently, lake trophic state rankings and groupings. Cluster analysis of the raw spectral data established distinctive lake groups, each comprised of water bodies having similar optical and physical properties. The spectral properties of each lake provided an integrated characterization of water quality and related use impairment problems. The trophic parameter estimates, as well as lake clusters and rankings derived from them, were in general agreement with contact-sensed data and with the raw spectral data. (Author)

A81-43256 **Thermal patterns of Lake Michigan and Lake Superior from satellite remote sensors and its uses.** H. W. Hoffman (NOAA, National Weather Service, Rosemont, IL). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 650-653.

Average surface water temperature maps have been drawn for Lake Michigan and Lake Superior in order to understand short- and long-range thermal patterns. The data used were generated over a two-year period from the Very High Resolution Radiometer on NOAA-4 and -5 satellites. Results indicate that the waters of Lake Michigan and Lake Superior as observed from satellite imagery act in similar manner as any other large and deep body of water in that fluctuations in water temperature occur very gradually, except for upwelling effects near the shore. The high specific heat of these water bodies has a profound effect on climatic conditions of adjacent air and land masses. V.L.

A81-43257 **Lake Ontario dynamics and water quality observations using thematically enhanced Landsat data.** A. Falconer (Spectral Data Corp., Regional Remote Sensing Facility, Nairobi, Kenya), M. Deutsch (U.S. Geological Survey, Reston, VA), and L. Myers (Library of Parliament, Ottawa, Canada). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 655-661. 15 refs. U.S. Geological Survey Contracts No. 14-08-0001-13169; No. 14-08-0001-13185.

The considered study is concerned with the use of satellite data for the identification of phenomena observed in western Lake Ontario. Ships and aircraft have been generally employed for gathering knowledge about the Great Lakes. It is pointed out that space technology has the potential to greatly increase the efficiency and effectiveness of lake monitoring programs. Satellites such as Landsat can obtain synoptic and repetitive views useful for guiding ships and aircraft to areas where more detailed studies are needed. An investigation is conducted of the techniques for photo-optical reprocessing of Landsat images and computer processing of digital Landsat data to enhance water quality information and to determine the appropriate use of each method. It is found that Landsat is an excellent source of synoptic data indicative of the dynamics of Lake Ontario and its water quality conditions. Landsat data needs to be specially processed (thematically enhanced) to depict anomalies indicative of water quality of dynamics. G.R.

A81-43258 * **Application of digital image processing techniques and information systems to water quality monitoring of Lake Tahoe.** A. Y. Smith and R. J. Blackwell (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 662-672. 8 refs.

The Tahoe basin occupies over 500 square miles of territory located in a graben straddling the boundary between California and Nevada. Lake Tahoe contains 126 million acre-feet of water. Since the 1950's the basin has experienced an ever increasing demand for land development at the expense of the natural watershed. Discharge of sediment to the lake has greatly increased owing to accelerated human interference, and alterations to the natural drainage patterns are evident in some areas. In connection with an investigation of the utility of a comprehensive system that takes into account the causes as well as the effects of lake eutrophication, it has been attempted to construct an integrated and workable data base, comprised of currently available data sources for the Lake Tahoe region. Attention is given to the image based information system (IBIS), the construction of the Lake Tahoe basin data base, and the application of the IBIS concept to the Lake Tahoe basin. G.R.

A81-43259 * **Trophic state determination for shallow coastal lakes from Landsat imagery.** C. W. Welby, A. M. Witherspoon (North Carolina State University, Raleigh, NC), and R. E. Holman, III (North Carolina Div. of Environmental Management, Edenton, NC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 674-680. 20 refs. Contract No. NAS8-31984.

A study has been carried out to develop a photo-optical technique by which Landsat imagery can be used to monitor trophic states of lakes. The proposed technique uses a single number to characterize the trophic state, and a feature within the satellite scene is used as an internal standard for comparison of the lakes in time. By use of the technique it is possible to assess in retrospect the trophic state of each individual lake. V.L.

A81-43356 # **Annual and interannual variations in outgoing longwave radiation over the tropics.** T. R. Heddinghaus and A. F. Krueger (NOAA, Climate Analysis Center, Washington, DC). *Monthly Weather Review,* vol. 109, June 1981, p. 1208-1218. 25 refs. NOAA-supported research.

Four years of satellite observations of the outgoing longwave radiation have been used to study the distribution of cloudiness and rainfall over the tropics. Annual and interannual variations are described, partially with the help of an eigenvector analysis. Interannual variations in the outgoing longwave radiation are particularly interesting since they tend to follow the Southern Oscillation. Consequently, it can be used to monitor changes in the large-scale circulation over the tropics. (Author)

A81-43538 **Remote sensing of dinoflagellate blooms in a turbid estuary.** J. C. Munday, Jr. and P. L. Zubkoff (Virginia Institute of Marine Science, Gloucester Point, VA). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Apr. 1981, p. 523-531. 36 refs.

Dinoflagellate blooms in sediment-laden waters of the York River, Virginia consistently produced reflectance decreases in visible bands, but produced equivocal changes in the photographic infrared. The equivocal infrared changes are due to simultaneous variations in chlorophyll and inorganic suspended sediment concentrations, as interpreted with a reflectance model. Equations are developed to show what conditions of changing chlorophyll and sediment can produce invariant reflectance. Color photography of dinoflagellate blooms in turbid estuaries portrays chlorophyll distributions with limited accuracy. The complexity of the spatial distributions necessitates remote sensing for synoptic mapping. (Author)

A81-43543 **Mapping wetlands using orthophotoquads and 35-mm aerial photographs.** R. A. Mead (Virginia Polytechnic Institute and State University, Blacksburg, VA) and P. T. Gammon (U.S. Geological Survey, Suffolk, VA). *Photogrammetric Engineering and Remote Sensing,* vol. 47, May 1981, p. 649-652. 11 refs.

A U.S. Geological Survey 7.5-minute orthophotoquad is used in combination with 35-mm color-infrared aerial transparencies to inventory and map North Carolina wetland areas of interest to regional or local land managers. Orthophotoquads are rectified black-and-white aerial photographs produced in the 7.5-minute, 1:24,000 scale standard map series. These orthophotoquads provide a mapping base of uniform scale upon which many vegetation and land-use boundaries may be delineated. The 35-mm aerial photographs, flown at a larger scale, for example, 1:6,000, along selected transects within the orthophotoquad afford identification of different wetland types. The vegetation types identified on the 35-mm infrared photographs thus assist the interpreter in identifying the desired wetland types on the total wetland area within the quad. In areas where orthophotoquads are available, this method permits resource managers to map wetlands without the need for expensive large format photography. (Author)

A81-43544 * **Multisensor analysis of hydrologic features with emphasis on the Seasat SAR.** J. L. Foster and D. K. Hall (NASA, Goddard Space Flight Center, Greenbelt, MD). *Photogrammetric Engineering and Remote Sensing,* vol. 47, May 1981, p. 655-664. 13 refs.

Synthetic aperture radar (SAR) imagery of the Wind River Range area in Wyoming is compared with visible and near-infrared imagery of the same area. Data from the Seasat L-Band SAR and an aircraft X-Band SAR are compared with Landsat Return Beam Vidicon (RBV) visible data and near-infrared aerial photography and topographic maps of the same area. It is noted that visible and near-infrared data provide more information than the SAR data when conditions are the most favorable. The SAR penetrates clouds and snow, however, and data can be acquired day or night. Drainage density detail is good on SAR imagery because individual streams show up well owing to riparian vegetation; this causes higher radar reflections which result from the 'rough' surface which vegetation creates. In the winter image, the X-Band radar data show high returns because of cracks on the lake ice surfaces. High returns can also be seen in the L-Band SAR imagery of the lakes due to ripples on the surface induced by wind. It is concluded that the use of multispectral data would optimize analysis of hydrologic features. C.R.

A81-43545 * **Use of ocean color scanner data in water quality mapping.** S. Khorram (California, University, Berkeley, CA). *Photogrammetric Engineering and Remote Sensing,* vol. 47, May

1981, p. 667-676. 53 refs. Research supported by the University of California; Grant No. NsG-5256.

Remotely sensed data, in combination with in situ data, are used in assessing water quality parameters within the San Francisco Bay-Delta. The parameters include suspended solids, chlorophyll, and turbidity. Regression models are developed between each of the water quality parameter measurements and the Ocean Color Scanner (OCS) data. The models are then extended to the entire study area for mapping water quality parameters. The results include a series of color-coded maps, each pertaining to one of the water quality parameters, and the statistical analysis of the OCS data and regression models. It is found that concurrently collected OCS data and surface truth measurements are highly useful in mapping the selected water quality parameters and locating areas having relatively high biological activity. In addition, it is found to be virtually impossible, at least within this test site, to locate such areas on U-2 color and color-infrared photography. C.R.

A81-43548 **Hydrogeology of glacial deposits from aerial photographs.** E. K. Sauer (Saskatchewan, University, Saskatoon, Canada). *Photogrammetric Engineering and Remote Sensing*, vol. 47, June 1981, p. 811-822. 28 refs.

It is pointed out that aerial photographs present a unique vertical perspective of certain landscape features which exist as expressions of the hydrogeology of an area. Geological processes interpreted from aerial photographs define ground-water systems and boundary conditions in glaciated terrain. The ground-water flow system within this framework is indicated on black-and-white photographs by springs, tone patterns, vegetation indicators, salinity of surface soils, slope instability, and apparent anomalies in streams and floodplains. Direct and indirect evidence of recharge and storage is often evident because of the landscape features. Discharge phenomena tend to be the most apparent, however. G.R.

A81-43549 **Wetland mapping from digitized aerial photography.** F. L. Scarpace, B. K. Quirk, R. W. Kiefer, and S. L. Wynn (Wisconsin, University, Madison, WI). *Photogrammetric Engineering and Remote Sensing*, vol. 47, June 1981, p. 829-838. 32 refs.

Computer classification of digitized aerial imagery for wetland mapping was investigated. A comparison was made between digital and manual interpretation of a high altitude color infrared photograph. The resulting computer classification was approximately 90 percent accurate. Digital analysis of aerial imagery provides high resolution information and could provide an operational method for monitoring and mapping wetlands. (Author)

A81-43742 * **Mapping the Great Salt Lake shoreline and associated waterfowl habitat from Landsat data.** J. Boissonnault (Utah, University, Salt Lake City, UT) and R. G. Witt (NASA, Goddard Space Flight Center, Greenbelt, MD). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-3-A-1 to RS-3-A-7.

A81-43745 * **Manual versus digital Landsat analysis for modeling river flooding.** W. R. Philipson and W. R. Hafker (Cornell University, Ithaca, NY). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-3-D-1 to RS-3-D-10. 8 refs. Grant No. NGL-33-010-171. DI Project A-089-NY.

The comparative value of manual versus digital image analysis for determining flood boundaries is being examined in a study of the use of Landsat data for modeling flooding of the Black River, in northern New York. The work is an extension of an earlier study in which Black River flooding was assessed through visually interpreted, multi-date Landsat band 7 images. Based on the results to date, it appears that neither color-additive viewing nor digital analysis of Landsat data provide improvement in accuracy over visual analysis of band 7 images, for delineating the boundaries of flood-affected areas. (Author)

A81-43746 **Preliminary survey of HCMM satellite thermal imagery as applied to hydrospherics.** D. R. Wiesnet, D. F. McGinnis, Jr., M. Matson, and J. A. Pritchard (NOAA, National Environmental Satellite Service, Washington, D.C.). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-3-E-1 to RS-3-E-12. 14 refs.

NASA's Heat Capacity Mapping Mission satellite, launched April 26, 1978 to an orbital altitude of 620 km, provides day/night thermal (10.5-12.5 micron) coverage on a regular basis. The satellite, having exceptional thermal and spatial resolution, has been used to study hydrospheric features. Estuarine tidal circulation monitoring is demonstrated in large systems; some degree of tidal circulation is inferred from thermal patterns even in small estuaries. Details of transient circulation features such as eddies are studied synoptically, and details of tidal currents are readily mapped. Attempts to estimate soil moisture from thermal patterns and/or thermal inertia measurements are complicated by canopy temperatures and geomorphology. Delineation and measurement of urban heat islands are shown to be useful for demographic studies and for determinining the effect of anthropogenic changes on mesoscale climates. J.F.

A81-43747 **Southern Chesapeake Bay circulation and suspended sediment transport analyzed using Landsat imagery.** J. C. Munday, Jr. and M. S. Fedosh (College of William and Mary, Gloucester Point, VA). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-3-F-1 to RS-3-F-5. 12 refs.

Fifty dates of Landsat images of the southern Chesapeake Bay are under study for circulation patterns and suspended sediment transport as a function of wind, tide, and fresh water inflow conditions. Methods of analysis include visual interpretation and color-coded density slicing of MSS 5 images coupled with color-additive viewing of MSS 4 to 7 images. At the Bay mouth, flood tide plumes are prominent on the north side, and ebb plumes carrying James River sediments on the south. A turbidity increase follows the progressive tidal wave of maximum current in its passage up the Bay. Plumes are oriented downwind. Winter and spring turbidities, in association with strong northerly winds, are higher than in summer. (Author)

A81-45429 * **Water quality mapping from Landsat digital data.** S. Khorram (California, University, Berkeley, CA; North Carolina State University, Raleigh, NC). *International Journal of Remote Sensing*, vol. 2, Apr.-June 1981, p. 145-153. 37 refs. Research supported by the University of California; Grant No. NsG-5256.

A81-46045 * **Mapping alpine soils using color positive and color infrared photographs.** S. Burns (Colorado, University, Boulder, CO). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 214-220. 11 refs. Grant No. NGL-06-003-200.

During a soil survey of the Indian Peaks area of the Colorado Front Range, it was found that large scale color positive photographs taken in the autumn were extremely useful for mapping alpine soils. Smaller scale color infrared photos were also helpful for delineation of mapping units. The soil mapping units were deduced on the basis of landforms and snow accumulation which is reflected in patterns of vegetational communities. (Author)

A81-46405 * **Manual versus digital Landsat analysis for delineating river flooding.** W. R. Philipson and W. R. Hafker (Cornell University, Ithaca, NY). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Sept. 1981, p. 1351-1356. 8 refs. Grant No. NGL-33-010-171. DI Project A-089-NY.

It has been found that flood boundary information derived from Landsat images, acquired at different flood stages, could be used to develop an empirical model for estimating the extent of flooding on the basis of in situ measurements of river discharge. An investigation was undertaken to determine whether improved results might have been obtained through digital image analysis or by including other Landsat spectral bands. The study area encompasses a highly flood-prone reach of the Black River in Lewis County, NY. It was found that visual analysis of aerial photographs and a Landsat band 7 image gave similar results. Visual and digital analysis of Landsat band 7 data gave similar results, and digital analysis of Landsat band 7 data gave results which were at least as good as digital analysis of combinations of spectral bands. G.R.

A81-47356 **Monitoring of snow covered area using satellite data.** H. Ochiai (Toba Merchant Marine College, Toba, Mie, Japan) and K. Takeda (Science and Technology Agency, National Institute of Natural Resources, Tokyo, Japan). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-114.* 12 p.

It is pointed out that the detection of snow regions in Japan by Landsat MSS and RBV is recognized as being more effective than the snow depth distribution maps compiled from data from snow survey stations. High-resolution data obtained by NOAA AVHRR is also considered suitable for monitoring snow covered areas. C.R.

A81-47647 * # **Airborne simultaneous spectroscopic detection of laser-induced water Raman backscatter and fluorescence from chlorophyll a and other naturally occurring pigments.** F. E. Hoge (NASA, Wallops Flight Center, Wallops Island, VA) and R. N. Swift (EG & G Washington Analytical Services Center, Inc., Pocomoke City, MD). *Applied Optics,* vol. 20, Sept. 15, 1981, p. 3197-3205. 22 refs.

The airborne laser-induced spectral emission bands obtained simultaneously from water Raman backscatter and the fluorescence of chlorophyll and other naturally occurring waterborne pigments are reported here for the first time. The importance of this type data lies not only in its single-shot multispectral character but also in the application of the Raman line for correction or calibration of the spatial variation of the laser penetration depth without the need for in situ water attenuation measurements. The entire laser-induced fluorescence and Raman scatter emissions resulting from each separate 532-nm 10-nsec laser pulse are collected and spectrally dispersed in a diffraction grating spectrometer having forty photomultiplier tube detectors. Results from field experiments conducted in the North Sea and the Chesapeake Bay/Potomac River are presented. Difficulties involving the multispectral resolution of the induced emissions are addressed, and feasible solutions are suggested together with new instrument configurations and future research directions. (Author)

A81-47676 # **Use of water Raman emission to correct airborne laser fluorosensor data for effects of water optical attenuation.** M. Bristow, D. Nielsen, D. Bundy, and R. Furtek (U.S. Environmental Protection Agency, Environmental Monitoring Systems Laboratory, Las Vegas, NV). *Applied Optics,* vol. 20, Sept. 1, 1981, p. 2889-2906. 42 refs.

It is shown that the interference from changes in optical attenuation experienced during airborne fluorosensor measurements of fluorophore concentrations in surface waters can be eliminated, by normalizing the fluorescence signal with the concurrent water Raman signal. In a remote, chlorophyll a concentration monitoring application of the principle in fresh waters, the Raman-corrected chlorophyll a fluorescence measurements were found to (1) be highly correlated with chlorophyll a ground truth data, and (2) have a water Raman signal reciprocal that varied directly as the beam attenuation coefficient. It is suggested that this latter relationship be exploited as a technique for remotely sensing changes in surface water optical attenuation. O.C.

A81-48554 * # **Airborne microwave radiometer remote sensing of lake ice.** C. T. Swift, R. F. Harrington, and H. F. Thornton (NASA, Langley Research Center, Hampton, VA). In: EASCON '80; Electronics and Aerospace Systems Conference, Arlington, VA, September 29-October 1, 1980, Conference Record.

New York, Institute of Electrical and Electronics Engineers, 1980, p. 369-373. 5 refs.

The NASA Langley C-Band Stepped Frequency Microwave Radiometer was used to conduct airborne remote sensing measurements of the Great Lakes ice cover during the winters of 1978 and 1979. In order to evaluate the use of microwave radiometry for remote sensing of fresh water ice, an initial experiment was conducted in February 1978. After the results were analyzed an algorithm was developed, and a more comprehensive mission was completed in March 1979, which related the thermal emission from lake ice to meaningful geophysical quantities. A clear discrimination of pressure ridges and rubble from base ice was observed, and evidence was found which showed gradual changes in the thickness of the base itself. Results indicate that passive microwave sensors can provide a measure of lake ice within uncertainties presented by the attenuation coefficient, and the changes in surface reflectivity imposed by surface roughness. D.L.G.

A81-48941 **Suburban soil loss and runoff simulation assisted by interpretation of large scale aerial photography.** J. R. Jensen (South Carolina, University, Columbia, SC) and Z. Berger (Exxon Product Research Co., Houston, TX). *Remote Sensing Quarterly,* vol. 3, Jan. 1981, p. 4-20. 27 refs.

A81-48942 * **Landsat observations of snowcover depletion and flooding in the Chesapeake Bay area during the winter of 1979.** J. Foster (NASA, Goddard Space Flight Center, Earth Survey Applications Div., Greenbelt, MD). *Remote Sensing Quarterly,* vol. 3, Jan. 1981, p. 21-28.

A81-48944 **A report on the use of remote sensing techniques for the supervision of New England coastal salt marshes.** D. E. Wallace (Nebraska, University, Omaha, NE). *Remote Sensing Quarterly,* vol. 3, Jan. 1981, p. 45-53. 9 refs.

A81-49757 * # **Landsat - What is operational in water resources.** E. M. Middleton (NASA, Goddard Space Flight Center, Greenbelt, MD) and J. C. Munday, Jr. (Virginia Institute of Marine Science, Gloucester Point, VA). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 43-52. 35 refs.

Applications of Landsat data in hydrology and water quality measurement were examined to determine which applications are operational. In hydrology, the principal applications have been surface water inventory, and land cover analysis for (1) runoff modeling and (2) abatement planning for non-point pollution and erosion. In water quality measurement, the principal applications have been: (1) trophic state assessment, and (2) measurement of turbidity and suspended sediment. The following applications were found to be operational: mapping of surface water, snow cover, and land cover (USGS Level 1) for watershed applications; measurement of turbidity, Secchi disk depth, suspended sediment concentration, and water depth. B.J.

A81-49761 # **Utilisation and benefits of SLAR in operational ice data acquisition.** H. G. Hengeveld (Department of the Environment, Atmospheric Environment Service, Downsview, Ontario, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings.
Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 81-88. 8 refs.

Since 1978, the SLAR system on the Atmospheric Environment Service ice reconnaissance aircraft has been used operationally to provide ice services during more than 3000 hours of reconnaissance flight time. The radar has been modified to include a dry silver processor/display, roll compensation, and sensitivity time control, and is employed together with visual observations and laser surface profiles for the in-flight generation of ice charts. Methods of direct relay of imagery to the user in conjunction with ice charts have been assessed. Primary benefits in the use of SLAR in ice reconnaissance are the large increase in data available to users, the ability to support users during storms, and the accumulation of high data range image records. Future developments will include the use of onboard CRT displays, the improvement of sensitivity time control circuits, and experiments involving improved radar design. B.J.

A81-49778 # **Application of synthetic aperture radar data to snow cover monitoring.** B. E. Goodison, S. E. Waterman (Department of the Environment, Atmospheric Environment Service, Downsview, Ontario, Canada), and E. J. Langham (Environment Canada, National Hydrology Research Institute, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 263-271. 10 refs.

As part of the Canadian Sursat (Surveillance Satellite) project, airborne X and L band synthetic aperture radar (SAR) data were obtained for a study site in the Ottawa area in November, 1978 and March, 1979, representing snow-free and snow-covered conditions, respectively. Coincident ground based measurements of snowpack properties, soil moisture, and meteorological parameters were collected. The SAR data were used in the form of 70 mm positive transparencies, which were analyzed with the aid of an image analyzer/density slicer. The SAR imagery of the snow-covered site showed a marked change in appearance particularly in the X-band data. In general, the non-forested areas of the study site exhibited a higher X-band radar return in the presence of the snow cover. Variations in the X-band return appear to be a complex function of snowpack properties, including depth, density, free water and water equivalent. In particular, areas of ice and dense snow were observed to produce relatively high radar returns. The L-band data showed little or no relationship between radar return and snowpack properties. The results suggest that SAR data could prove useful for detecting snow cover in non-forested areas. (Author)

A81-49796 # **Airborne estimation of water quality parameters in Lake Ontario.** H. H. Zwick (Canada Centre for Remote Sensing, Ottawa, Canada), S. C. Jain, S. A. Gluckstein (Moniteq, Ltd., Concord, Ontario, Canada), and T. A. Calwell (Genesys Group, Ltd., Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 443-451. 24 refs.

A81-49797 # **Use of Landsat images in the monitoring and study of the LG 2 reservoir during the filling period (Les images Landsat dans la surveillance et l'étude du réservoir de LG 2 durant la période de remplissage).** P. Laframboise (Société de Développement de la Baie James, Montreal, Canada) and A. Bachand (Société d'Energie de la Baie James, Montreal, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 453-457. 5 refs. In French.

The extent of processes associated with the filling of the reservoir behind the LG 2 dam, a part of the La Grande Rivière hydroelectric system in northern Quebec, has been monitored by the use of Landsat 2 and 3 images. Images were acquired starting before the initiation of filling on November 27, 1978 through the end of the following year from the Landsat MSS and RBV instruments. The major stages of dam filling were studied by the visual analysis of the images, including the ecology and physiography of the site before filling, the elevation of vegetation by the rising ice cover, and the turbidity and location of partially flooded vegetation during the free-water period. The major factor limiting the surveillance of the reservoir has been the availability of suitable images, particularly during the summer months. A.L.W.

A81-49968 * # **Freshwater ice thickness observations using passive microwave sensors.** D. K. Hall, J. L. Foster, A. T. C. Chang, and A. Rango (NASA, Goddard Space Flight Center, Hydrological Sciences Branch, Greenbelt, MD). *IEEE Transactions on Geoscience and Remote Sensing*, vol. GE-19, Oct. 1981, p. 189-193. 11 refs.

Walden Reservoir, a freshwater lake in north-central Colorado, was overflown six times by a NASA C-130 aircraft between January 1977 and April 1980. The aircraft was equipped with four microwave radiometers operating between 0.81 and 6.0 cm in wavelength (37.0 to 5.0 GHz). The 6.0-cm radiometer data showed a good relationship with ice thickness based on a sample of four ice thickness values. The 1.67- and 1.35-cm radiometer data showed weaker relationships with ice thickness. The 0.81-cm sensor data showed no positive relationship with ice thickness. None of the relationships was statistically significant because of the small sample size. The 6.0-cm sensor data in the nadir-viewing mode was found to have the most potential of all the wavelengths studied, for use in remotely determining ice thickness. The 6.0-cm radiometer probably sensed the entire thickness of the ice on the reservoir (ranging from 25.4 to 67.3 cm in thickness) and was apparently not significantly affected by the snow overlying the ice. The shorter wavelengths are scattered by the snow overlying the ice and are more suitable for snow studies than for ice thickness studies. (Author)

The feasibility of using an airborne multispectral scanner to monitor shoreline algae problems is demonstrated. Multispectral data were collected at two sites on the U.S. Lake Ontario shoreline. Computer generated color maps were produced to show spatial distribution of Cladophora in the nearshore zone and to estimate standing crop. Spectral features of Cladophora were related to measured standng crop. GRA

GOES and TIROS/NOAA-6 satellite data were evaluated visually and digitally to assess their potential for aiding the process of state wide snow extent mapping in Minnesota. This state contains a geographic continuum spanning from a large open agricultural area, through a partially forested transitional zone, to a heavily forested area. The ability to discriminate snow extent statewide was found to be influenced by the state of sensing and the cover types involved. GRA

In anticipation of using LANDSAT and Nimbus 7 coastal zone color scanner data to observe the decrease in suspended solids in Lake Superior following cessation of the dumping of taconite tailings, a series of lakewide sampling cruises was conducted to make radiometric measurements at a lake level. A means for identifying particulates and measuring their concentration from LANDSAT data was developed. The initial distribution of chemical parameters in the extreme western arm of the lake, where the concentration gradients are high, is to be based on the LANDSAT data. Subsequent lakewide dispersal and distribu-

tion is to be based on the coastal zone color scanner data

SYNERGISTIC RELATIONSHIPS AMONG REMOTE-SENSING AND GEOPHYSICAL MEDIA: GEOLOGICAL AND HYDROLOGICAL APPLICATIONS Final Report
David L. Southwick, Joseph E. Goebel, Matt Walton, Lawrence G. Batten, and James Heutmaker, Principal Investigators *In its* A Study of Minn. Land and Water Resources Using Remote Sensing, Vol. 14 1 Jan. 1981 29 p ref ERTS

Avail: NTIS HC A05/MF A01 CSCL 08G

Skylab photographs, side-looking radar imagery, published soil maps, topographic maps, conventional aerial photography as well as LANDSAT imagery under wet and dry changes for several years were analyzed over selected areas in Minnesota to test their usefulness in detecting near-surface ground water. Results show that optical density read from LANDSAT data is not a reliable discriminator of depth to shallow ground water when one band of one scene is used alone, and is little improved when several bands of several scenes are used synergistically. The method is enhanced if information from soil maps is included in the analysis, especially for discriminating boggy ground from better drained areas. It appears, however, that in areas where soil maps and good topographic maps already exist, the depth to ground water can be predicted from those media as well as (if not better than) it can be predicted from remote imagery. The LANDSAT method used demonstrated no capability for recognizing deeper categories of ground water.

A preliminary methodology was developed for siting windmills and selecting test sites for locating anemometers in Erie, Niagra, and Orleans Counties, New York. Overlays were derived fom historic airphotos (1938-1968) of the Love Canal area in an effort to show changes and delineate drainage areas. Projects in progress include assessing scenic views in Hamilton County, New York; developing algorithms for predicting vineyard yield; and a study of the spectral effects of sulfur dioxide on bean yield. Spin-off research includes developing a remote sensing method for improving lake sampling strategies, using digital analysis of LANDSAT data to characterize acid lakes; and studying advanced technologies for environment management and monitoring.

A COMPARISON OF OBSERVED AND ANALYTICALLY DERIVED REMOTE SENSING PENETRATION DEPTHS FOR TURBID WATER
W. Douglas Morris, J. W. Usry, William G. Witte, Charles H. Whitlock, and E. A. Guraus Sep. 1981 23 p refs
(NASA-TM-83176) Avail: NTIS HC A02/MF A01 CSCL 08H

The depth to which sunlight will penetrate in turbid waters was investigated. The tests were conducted in water with a single scattering albedo range, and over a range of solar elevation angles. Two different techniques were used to determine the depth of light penetration. It showed little change in the depth of sunlight penetration with changing solar elevation angle. A comparison of the penetration depths indicates that the best agreement between the two methods was achieved when the quasisingle scattering relationship was not corrected for solar angle. It is concluded that sunlight penetration is dependent on inherent water properties only.

EVALUATION OF REMOTE SENSING DATA FOR INPUT INTO HYDROLOGICAL SIMULATION PROGRAM-FORTRAN (HSPF) Final Report, Mar. 1979 - Jun. 1980
D. D. Franz and S. M. Lieu Jun. 1981 107 p refs
(Contract EPA-68-01-5801)
(PB81-209561; EPA-600/3-81-037) Avail: NTIS HC A06/MF A01 CSCL 08H

The feasibility of using a remotely sensed data base as input into the hydrologic simulation program-FORTRAN was evaluated (HSPF). Data from LANDSAT and conventionally obtained data were used to set up the input parameters of HSPF. Simulations were run to compare the two sets of data. The remotely sensed data performed as least as well as the conventional one when compared with observed data. in addition, it was estimated to offer savings of 30 to 50 percent in the cost of set up and operations.

QUANTIFICATION OF NON-POINT SOURCE SEDIMENTATION THROUGH DENSITOMETRIC ANALYSIS OF COLOR INFRARED AERIAL PHOTOGRAPHY
Terrence J. Keating, Jerry D. Lowry, and Rachel S. Smith Apr. 1981 79 p refs Sponsored by Dept. of Interior
(PB81-209157; W81-03252; OWRT-A-049-ME(2)) Avail: NTIS HC A05/MF A01 CSCL 13B

A method for the detection, quantification, and location of nonpoint pollution sources upon the use of aerial color infrared photography was established. An airborne small format camera system was flown simultaneous to minimal selected ground sampling. This allowed measurement of ground levels of turbidity and suspended solids over relatively large watershed areas. Calibration of monitored rivers was used to assess firm response to given pollutant types; with quantification by densitometry. Suspended solids concentrations from firm density values are estimated.

DATA PROCESSING AND DISTRIBUTION SYSTEMS

Includes film processing, computer technology, satellite and aircraft hardware, and imagery.

A81-41055 **Multispectral texture analysis (Multispektrale Texturanalyse).** M. Dehn (Karlsruhe, Universität, Karlsruhe, West Germany). *Bildmessung und Luftbildwesen,* vol. 49, July 1, 1981, p. 101-110. 5 refs. In German. Research supported by the Deutsche Forschungsgemeinschaft.

The multispectral quality of texture analysis for the classification of land use grades is investigated. A test image, composed of various FMP scenes, is classified using image element features. Extracted texture parameters computed from several spectral bands were found to give better results than the information derived from only one spectral band and greatly reduced the number of incorrect classification allocations. The data to be classified required a detailed investigation in order to extract the parameters which would best describe the object classes. Calculation of the feature extraction parameters required from 60 to 90 minutes for 512 x 512 image elements.

J.F.

A81-41057 **A rectification technique for digital orthophoto production (Ein Entzerrungsverfahren zur Herstellung digitaler Orthophotos).** W. Göpfert (Institut für angewandte Geodäsie, Frankfurt am Main, West Germany). *Bildmessung und Luftbildwesen,* vol. 49, July 1, 1981, p. 117-125. 9 refs. In German.

Digital geometrical image processing is applied to a digital/analog converted aerial photograph to produce a digital orthophoto. A rubber stretch algorithm, specifically the multiquadratic interpolation approach, is used as a geometric processing method. DTM data, as well as photogrammetric model evaluation, are used as input data types. Corresponding gray value transfer characteristics are generated to radiometrically adjust the various photographs to be mosaicked. During the digital/analog conversion, optimal image contrasting and selective detail enhancement are obtained. As an example, a digital orthophoto of scale 1:25,000 is produced from 1:62,000 aerial photography using as input terrain profile data obtained through analytical photogrammetry.

A81-41479 # **Accuracy of transmission of spectral contrasts in multispectral aerial photography, with application to problems of object recognition (O tochnosti peredachi spektral'nykh kontrastov pri mnogozonal'nom aerofotografirovanii primenitel'no k zadacham raspoznavaniia obe'ktov).** Iu. A. Dzhemard'ian, S. V. Komissarenko, and V. G. Skrotskii. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 20-24. In Russian.

An analysis is presented of systematic and random errors arising in the multispectral aerial photography of earth resources; the multispectral method under consideration involves photochemical processing and microphotometry of the multispectral negatives. The use of two recognition models for crop identification on the Kursk test polygon is examined.

B.J.

A81-41480 # **Experience with the determination of optical image distortions of landscape elements on IR aerial photographs (Opyt opredeleniia opticheskikh iskazhenii izobrazheniia elementov landshafta na IK aerosnimkakh).** V. A. Kharitonov and V. V. Gorbachev. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 25-33. 8 refs. In Russian.

The paper considers the use of photographic photometry to determine optical image distortions on infrared aerial photographs due to the nonuniformity of angular distribution of reflected radiation. An analysis of experimental aerial photography data confirms the effectiveness of this method. It is concluded that it is necessary to allow for the angular-distribution nonuniformity in the qualitative processing of aerial and spaceborne photographs. B.J.

A81-41481 # **Experience with image combination in multispectral aerial photography (Opyt sovmeshcheniia izobrazhenii mnogozonal'noi aeros'emki).** A. N. Belinskii and I. M. Bokshtein. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 34-37. In Russian.

An interactive method for the combination of images simultaneously obtained in different spectral regions is described. The image combination algorithm consists of four operations: elimination of the nonuniformity of illumination, adaptive quantization, determination of contours, and the correlation of reference sections and the final combination of images. The use of this technique in the automated classification of multispectral images is considered. B.J.

A81-41482 # **Machine method for the equalization of average phototone in an aerial photograph field (Mashinnyi metod vyravnivaniia srednego fototona po poliu aerofotoizobrazheniia).** G. G. Andreev and N. N. Koptseva. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 38-41. In Russian.

The paper examines aspects of the computer correction of the phototone of aerial photographs whose purpose is to eliminate distortions caused by the nonuniformity of the lens illumination distribution function. A block diagram for the correction program on the EC-1022 computer is presented. The method can be used at the first stage of the machine processing of aerial photographic images.

B.J.

A81-41484 # **The use of the spectral and physical-geographic characteristics of natural objects for the interpretation of multispectral satellite images (Ispol'zovanie spektral'nykh i fiziko-geograficheskikh kharakteristik prirodnykh obrazovanii pri deshifrirovanii mnogozonal'nykh sputnikovykh izobrazhenii).** N. K. Vinnichenko. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 45-50. In Russian.

Various aspects of the thematic interpretation of multispectral satellite images on the basis of the spectral and physical-geographic characteristics of natural objects on the earth's surface are considered. A block diagram describing the use of a priori information for the analysis of multispectral satellite images is presented. B.J.

A81-42555 # **Determination of the external-orientation elements of single photographs and stereopairs (Opredelenie elementov vneshnego orientirovaniia odinochnykh snimkov i stereopar).** I. T. Antipov (Nauchno-Issledovatel'skii Institut Prikladnoi Geodezii, USSR) and T. A. Bashkova. *Geodeziia i Aerofotos'emka,* vol. 1, 1981, p. 87-94. In Russian.

The paper formulates principles for the determination of the external-orientation elements (EOE) of single aerial photographs and stereopairs for their use in photogrammetry. A system of normal equations is developed for transformation to the inclined plane at all photograph points; the solution of these equations makes it possible to obtain quantities that characterize the position of the inclined plane. The EOEs of a photograph are determined from these quantities. A method is proposed for EOE determination in the processing of aerial photographs by analog steroephotogrammetry.

B.J.

A81-42631 **A measure of reliability for classification of earth satellite data.** M. Alvo and M. Goldberg (Ottawa, University, Ottawa, Canada). *IEEE Transactions on Systems, Man, and Cybernetics,* vol. SMC-11, Apr. 1981, p. 312-318. 13 refs.

A measure is presented which may be used to indicate reliability or confidence in the classification of individual Landsat imagery pixels; in turn permitting comparisons, on an individual pixel basis, of classifications obtained from successive images. The immediate neighborhood in spectral space of each vector value of the class is compared with that of the modal vector by means of a modified chi-square goodness-of-fit statistic. A normalization technique based on simultaneous interference, which requires only the specification of a significance level (the usual alpha in statistics) is described, and the satisfactory performance of the measures is demonstrated through both simulated data and Landsat imagery. O.C.

A81-43185 **The GOES data collection system.** M. L. Nelson (NOAA, National Environmental Satellite Service, Washington, DC). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 45-47.

A brief look at the Geostationary Operational Environmental Satellite (GOES) Data Collection System (DCS) is provided. The basic configuration of the system is identified by describing the major elements and their functions. The basic design criteria, together with system development has led to a truly operational program. The National Environmental Satellite Service (NESS) and many users have accumulated years of experience with this program so that it is now possible to identify the useful features. This background also has made it possible for NESS and the users to plan for additional capabilities. System improvements and how they benefit the users are explained. Finally, the growth of the system in terms of number of platforms and users are given. (Author)

A81-43189 **U.S. geological survey application of satellite telemetry for the support of hydrologic data collection.** W. G. Shope and R. W. Paulson (U.S. Geological Survey, Reston, VA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 60-64.

The network of hydrologic stations operated by the Geological Survey's Water Resources Division is discussed. Attention is given to the idea of using a satellite data collection system in order to automate the link between the field site sensor and the computer networks. It is noted that this automation would not only save manpower but would also shorten the collection cycle from weeks or months to hours. The satellite system comprises a satellite in orbit, a network of small battery-operated radio transmitters (called Data Collection Platforms, or DCP's), and one or more earth receiving stations. It is noted that monitoring the networks through the use of real-time data provides the Geological Survey with a valuable operational tool that will result in better quality data and greater efficiencies in network management. C.R.

A81-43222 **Characteristics of microwave emission of significance to satellite remote sensing of soil water.** R. W. Newton (Texas A & M. University, College Station, TX). In: Satellite Hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 353-362. 18 refs.

Newton (1977) developed a method of interpreting passive microwave emission measurements in terms of average soil moisture over a predicted soil depth. In order to test the approach for a relatively wide range of soil water and soil temperature profile shapes, an analytical model is used to predict the microwave emission at four frequencies of soil water and soil temperature profiles measured by Jackson (1973) over a soil moisture range from saturation through dry down as well as at both day and night periods. It was determined that the average soil water parameter developed by Newton and its associated depth could be estimated from microwave emission measurements within a minimum of ambiguity. It was also found that the depth associated with the average soil water parameter is only slightly dependent on the soil temperature profile, which indicates that an improvement in depth of penetration will probably not be obtained from night measurements. B.J.

A81-43531 **Correlation techniques and devices.** G. Konecny and D. Pape (Hannover, Universität, Hanover, West Germany). *(International Society for Photogrammetry, Congress, 14th, Hamburg, West Germany, July 13-25, 1980.) Photogrammetric Engineering and Remote Sensing,* vol. 47, Mar. 1981, p. 323-333. 69 refs.

Image correlation techniques are reviewed according to the photogrammetric and mathematical fundamentals as well as the techniques for video-conversion, correlation, and rectification of video signals. The historical development of automatic image correlation devices from the Hobrough Stereomat, via the Bunker Ramo UNAMACE to the Hobrough Gestalt System and the Bendix AS-11-BX is then traced. Reference is made to the Rastar Correlator under development at the University of Hannover, based on designs by Hobrough and completed by Pape. Finally, other experimental attempts at image correlation, such as (coherent) optical correlation and digital off-line correlation, are summarized. (Author)

A81-43532 **Automation in photogrammetry.** J. B. Case (U.S. Defense Mapping Agency, Washington, DC). *(International Society for Photogrammetry, Congress, 14th, Hamburg, West Germany, July 13-25, 1980.) Photogrammetric Engineering and Remote Sensing,* vol. 47, Mar. 1981, p. 335-341. 39 refs.

All functional aspects of photogrammetry, i.e., triangulation mensuration, elevation data extraction, planimetric data extraction, and rectification and orthorectification, are now being automated to some degree. Automation extends from computer control of comparators and analog stereo plotters, through the analytical stereoplotters, to orthophoto printers and fully automated correlation equipment. The drive towards automation has been triggered not only by the continuing necessity to reduce costs, but also by the need to generate new products (e.g., DTM, land use, etc.) and to utilize other than conventional mapping photography. These have led, in turn, to the necessity for data editing and data management systems. The trend in the future will be towards the ever-increasing use of digital image processing technology. Examples of several levels of automation in photogrammetry are described. (Author)

A81-43546 **A capture-recapture approach for estimation of detection probabilities in aerial surveys.** L. D. Maxim (Everest Consulting Associates, Princeton, NJ), L. Harrington (Mathtech, Inc., Arlington, VA), and M. Kennedy. *Photogrammetric Engineering and Remote Sensing,* vol. 47, June 1981, p. 779-788. 17 refs.

A simple approach for estimating detection probabilities from imagery when ground truth data are non-existent is presented. Based upon what are termed capture-recapture statistics, the method requires only an independent examination of the imagery by two or more observers. In its simplest form the approach requires the assumptions that detections are independent and that no false positives occur. When data from three or more observers are available, checks upon model assumptions can be performed and less restrictive models can be developed. The approach is illustrated with several numerical examples. (Author)

A81-43734 * **Training site statistics from Landsat and Seasat satellite imagery registered to a common map base.** J. Clark (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-1-F-1 to RS-1-F-9. 5 refs. Contract No. NAS7-100.

Landsat and Seasat satellite imagery and training site boundary coordinates were registered to a common Universal Transverse Mercator map base in the Newport Beach area of Orange County, California. The purpose was to establish a spatially-registered, multi-sensor data base which would test the use of Seasat synthetic aperture radar imagery to improve spectral separability of channels used for land use classification of an urban area. Digital image processing techniques originally developed for the digital mosaics of the California Desert and the State of Arizona were adapted to spatially register multispectral and radar data. Techniques included control point selection from imagery and USGS topographic quadrangle maps, control point cataloguing with the Image Based Information System, and spatial and spectral rectifications of the imagery. The radar imagery was pre-processed to reduce its tendency toward uniform data distributions, so that training site statistics for selected Landsat and pre-processed Seasat imagery indicated good spectral separation between channels. (Author)

A81-43736 **On the analysis of remote sensing data to predict selected vegetative variables.** R. K. Blystone and M. J. Duggin (New York, State University, Syracuse, NY). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-2-B-1 to RS-2-B-11. 17 refs. Research supported by the U.S. Department of Agriculture.

An empirical approach is used to predict biological variables from remote sensing data. The empirical use of an association as a predictor model when analyzing an image is shown to be dangerous, since there may be many possible associations of remote sensing data with various biological variables. Moreover, use of ratios of recorded radiance values do not always work for a given situation. Approaches for formulating a better empirical predictor model, which would be applicable to a single image or limited ground area at one point in time are outlined. A regression model is constructed in which remotely sensed radiance values are the independent variables and the vegetative property of interest is the dependent variable. The necessity of constructing an economical multiple linear regression (MLR) model is discussed, and the importance of using training data to develop the MLR and test data for determining the adequacy of its predictions is explained. J.F.

A81-45431 **A comparison between two photographic methods for the determination of relative bidirectional reflectance.** P. J. Curran, T. J. Munday, and E. J. Milton (Reading, University, Reading, Berks., England). *International Journal of Remote Sensing,* vol. 2, Apr.-June 1981, p. 185-188. 5 refs. Research supported by the Natural Environment Research Council and University of Reading.

Two simple photographic methods have recently been proposed for the measurement of relative bidirectional reflectance (Lillesand and Kiefer 1979, Curran 1980). These two methods were used to calculate the relative bidirectional reflectance of ten contrasting surfaces. The photographic relative bidirectional reflectance so recorded, was then compared with the radiometric bidirectional reflectance for each surface. Two conclusions were drawn: first, that relative bidirectional reflectance can be measured using these simple photographic techniques, and second, that there was no significant difference between the Lillesand and Kiefer and Curran methods for photographically deriving relative bidirectional reflectance. (Author)

A81-45433 * **Application of digital terrain data to quantify and reduce the topographic effect on Landsat data.** C. O. Justice, S. W. Wharton, and B. N. Holben (NASA, Goddard Space Flight Center, Earth Resources Branch, Greenbelt, MD). *International Journal of Remote Sensing,* vol. 2, July-Sept. 1981, p. 213-230. 29 refs.

Landsat multispectral scanner (MSS) data are integrated with 30 m US Geological Survey digital terrain data to quantify and reduce topographic effects on imagery of a forested mountain ridge in central Pennsylvania. Spectral band ratioing slightly decreased variation of Landsat data for 50% of the transects and could not eliminate direct-light topographic effects. A Lambertian model increased topographic effect, and a modified Lambertian model decreased variation produced by the original model, but gave higher variances than found in the raw Landsat data. A non-Lambertian model, however, decreased variation by 86%, reducing topographic effects. The study demonstrated that high quality digital terrain data can be used to develop and test improved radiative transfer models, and enhance the utility of MSS data. D.L.G.

A81-46040 * **Maximum likelihood estimation of label imperfection probabilities and its use in the identification of mislabeled patterns.** C. B. Chittineni (Lockheed Engineering and Management Services Co., Houston, TX). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 158-170. 18 refs. Contract No. NAS9-15800.

Estimating label imperfections and the use of estimations in the identification of mislabeled patterns are discussed. Expressions are presented for the asymptotic variances of the probability of correct classification and proportion, and for the maximum likelihood estimates of classification errors and a priori probabilities. Models are developed for imperfections in the labels and classification errors, and expressions are derived for the probability of imperfect label identification schemes resulting in wrong decisions. The expressions are used in computing thresholds and the techniques are given practical applications. The imperfect label identification scheme in the multiclass case is found to amount to establishing a region around each decision surface, and decisions of the label correction scheme are found in close agreement with the analyst-interpreter interpretations of the imagery films. As an example, the application of the maximum likelihood estimation to the processing of Landsat MSS data is discussed. D.L.G.

A81-46041 * **Context distribution estimation for contextual classification of multispectral image data.** J. C. Tilton, P. H. Swain, and S. B. Vardeman (Purdue University, West Lafayette, IN). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980. p. 171-180. NSF Grant No. MCS-78-04366; Contract No. NAS9-15466.

A classification algorithm incorporating contextual information in a general, statistical manner is presented. Methods are investigated for obtaining adequate estimates of the context distribution (a statistical characterization of context) upon which the classification algorithm depends. Finally, a method of estimating optimal algorithm parameters prior to performing preliminary classifications is explored. (Author)

A81-46042 **Stratification of Landsat data by uniformity productivity of soils.** J. Schubert, P. Chagarlamudi (Deloitte, Haskins and Sells Associates, Ottawa, Canada), J. A. Shields, and A. R. Mack (Agriculture Canada, Land Resource Research Institute, Ottawa, Canada). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 186-194. 11 refs.

The goal of this study was to develop and verify methods to use Landsat data for mapping and quantifying the productivity of soil areas on which the annual yields of spring wheat exposed to the same weather conditions are generally different. The study was done in two parts. First, a calibration study was done to determine which features visible on Landsat imagery were associated with different relative productivities. Then, in a two-part accuracy verification study, Uniform Productivity Area (UPA) boundaries were drawn on three map sheets (1:250,000 Canadian National Topographic System) and the relative productivity of each UPA within 25 townships in the Canadian Prairies were estimated. The boundaries were compared with known soil productivity area boundaries and the relative productivity ratings were compared with reported yields. (Author)

A81-46043 **Interactive processing of Landsat image for morphopedological studies.** D. Chaume and N. P. Thien (IBM France, S.A., Paris, France). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 195-204. 5 refs.

A study of the Gale area of the Mandingue plateau was studied by means of the ERMAN II earth resources management system and a novel, interactive image processing system. Training fields belonging to the different morphopedological units were determined from four photographs of the study area, and a model of transformation between corresponding coordinates on images and photographs was calculated from a set of landmarks. The coordinates of the subimages were obtained by applying the model of transformation to the coordinates on the photographs. Separate models of deformation were in addition calculated for smaller areas, corresponding to each aerial photograph. O.C.

A81-46052 * # **Inventory estimation on the massively parallel processor.** P. D. Argentiero, J. P. Strong, and D. W. Koch (NASA, Goddard Space Flight Center, Greenbelt, MD). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 286-293. 6 refs.

This paper describes algorithms for efficiently computing inventory estimates from satellite based images. The algorithms incorporate a one dimensional feature extraction which optimizes the pairwise sum of Fisher distances. Biases are eliminated with a premultiplication by the inverse of the analytically derived error matrix. The technique is demonstrated with a numerical example using statistics obtained from an actual Landsat scene. Attention was given to implementation of the Massively Parallel processor (MPP). A timing analysis demonstrates that the inventory estimation can be performed an order of magnitude faster on the MPP than on a conventional serial machine. (Author)

A81-46192 **Simulation of orbital image-sensor geometry.** R. B. Forrest. *Photogrammetric Engineering and Remote Sensing*, vol. 47, Aug. 1981, p. 1187-1193. 5 refs.

The essential dynamic aspects of orbital image-sensor geometry are modeled in a FORTRAN computer program presented and described in the paper. Parameters are listed for the Landsat MSS, and the program is sufficiently versatile that it can be modified to simulate other image-sensor geometries and formats. The program is organized to provide earth-surface coordinate outputs (latitude/longitude, local Cartesian) for any number of image coordinate inputs (pixel row/column numbers). Individual terrain heights may be specified for each image point of interest. (Author)

A81-46197 **Alternative 'scale up' estimators for aerial surveys where both detection and classification errors exist.** L. D. Maxim (Everest Consulting Associates, Princeton Junction, NJ), L. Harrington (Mathtech, Rosslyn, VA), and M. Kennedy. *Photogrammetric Engineering and Remote Sensing*, vol. 47, Aug. 1981, p. 1227-1239. 16 refs.

Four statistical estimators are proposed, characterized, and illustrated in order to scale up observed aerial survey counts of objects, for cases when both detection and classification errors are present. The context of the study is for an individual image or frame, and matrix methods are used for extensions to related aspects of the sampling theory. The model presented considers detection and classification as a two-stage process. Partial ground truth enables efficient estimators to be constructed or it can be used in place of either detection or identification probabilities. Of the four numerical examples presented, three make use of partial ground truth. Results may be used in agriculture and in the study of environmental pollutants. K.S.

A81-46378 * **Correlation function studies for snow and ice.** F. Vallese and J. A. Kong (MIT, Cambridge, MA). *Journal of Applied Physics*, vol. 52, Aug. 1981, p. 4921-4925. 13 refs. Research supported by the Charles Stark Draper Laboratory; Grant No. NAG5-141; Contract No. F19628-80-C-0052.

The random medium model is used to characterize snow and ice fields in the interpretation of active and passive microwave remote sensing data. A correlation function is used to describe the random permittivity fluctuations with the associated mean and variance and correlation lengths; and several samples are investigated to determine typical correlation functions for snow and ice. It is shown that correlation functions are extracted directly from appropriate ground truth data, and an exponential correlation function is observed for snow and ice with lengths corresponding to the actual size of ice particles or air bubbles. Thus, given that a medium has spatially stationary statistics and a small medium, the random medium model can interpret remote sensing data where theoretical parameters correspond to actual physical parameters of the terrain. D.L.G.

A81-46402 * **Radiometry with nighttime DMSP images in digital form.** T. A. Croft (SRI International, Menlo Park, CA). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Sept. 1981, p. 1319-1325. 10 refs. NASA-supported research.

The USAF Defense Meteorological Satellite Program (DMSP) spacecraft sends images to earth in the form of numbers. It has been common practice to erase the only digital records, the magnetic tapes, for reuse, after films (resembling photographs) have been created from the numbers. While the DMSP images have been widely used, their application in research has been hindered by both the lack of digital data and the lack of an authoritative source of related technical information. The character of the digital form is considered. Each image is essentially a three-dimensional list (X,Y,Z) in which X and Y represent the position coordinates of a pixel and Z is its associated radiance. Only the value of Z is given and the X-Y position must be deduced from adjunct information. Each original scan composed of 1464 pixels represents an area on the earth's surface about 3 km wide and 3000 km long. Strengths and weaknesses of the system with respect to research applications are considered, and concepts for the design of a nocturnal imager are discussed. G.R.

A81-46917 # **Large-area histograms from Meteosat images.** K. O. Röska (ESA, European Space Operations Centre, Darmstadt, West Germany). *ESA Bulletin*, no. 27, Aug. 1981, p. 13-15.

The possibility of building multidimensional histograms from multichannel Meteosat images that improve feature identification and interpretation capabilities is demonstrated. Two-dimensional histograms of large and meteorologically uniform areas are given as examples, together with an automatic feature identification technique having modest computational requirements. The two histogram types produced by the method are infrared/visible and infrared/water vapor. O.C.

A81-47007 # **Angular anisotropy of reflection from various types of underlying surface. I - Snow cover. II - Desert (Uglovaia anizotropiia otrazheniia razlichnykh tipov podstilaiushchei poverkhnosti. I - Snezhnyi pokrov. II - Pustynia).** V. I. Korzov and K. Ia. Kondrat'ev. In: Radiation studies in the atmosphere.

Leningrad, Gidrometeoizdat, 1980, p. 43-63. 14 refs. In Russian.

Aerial measurements of the angular anisotropy of reflection of short-wave radiation from snow cover were performed with instruments aboard the IL-18 aircraft. Measurements of relative spectral brightness and spectral albedo are used to calculate coefficients of brightness, anisotropy of reflection, and asymmetry of reflection in the solar-vertical plane. These characteristics were used to analyze the angular anisotropy of reflection from snow cover as a function of solar height, flight altitude, angles of sight, and wavelength. Aerial measurements of the angular anisotropy of reflection from desert regions are also analyzed. Coefficients of brightness, anisotropy of reflection, and asymmetry in the solar-vertical plane are used to analyze the angular anisotropy of reflection from the desert as a function of wavelength, solar height, flight altitude, and angles of sight. F.G.M.

A81-47349 **Use of elevation models for landform analysis by Seasat-SAR imagery.** A. Apolloni (Calabira, Università, Cosenza, Italy), A. Carrara (CNR, IRPI, Cosenza, Italy), and P. Murino (Napoli, Università, Naples, Italy). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-98*. 17 p. 35 refs.

Results are presented of a study of the feasibility of applying Seasat-SAR data to the identification and classification of slope instability phenomena. The study was carried out for the Buonamico Basin area of southern Calabria, a region characterized by rugged topography, strong relief, steep irregular slopes and a very dense stream network frequently subject to landslides and erosion. The imagery obtained was processed to remove radar speckle, then calibrated geometrically with reference to a digital terrain topographic map and calibrated radiometrically according to scattering area and direction. The resulting imagery is found to be strongly influenced by radar beam geometry, although the dominant landform features may be detected. On the basis of these results, it is recommended that (1) mountain zones be covered by at least two passes by an airborne or spaceborne system; (2) radiometric calibration be performed using properly smoothed digital terrain maps; and (3) radar data be compared with a large set of optically acquired and ground-based data. A.L.W.

A81-47351 **Application of delta modulation in on-board and ground video data processing systems for the purposes of remote sensing.** D. Mishev and P. Petrov (B'lgarska Akademiia na Naukite, Tsentralna Laboratoriia po Kosmicheski Izsledvaniia, Sofia, Bulgaria). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-102*. 18 p. 8 refs.

The possibilities of delta modulation in the processing of multispectral video-data for remote sensing are discussed. It is noted that delta modulation allows the development of flexible digit systems for express analysis of a considerable amount of video data in a real time scale. Certain space-invariant operations and scale transformations are shown in data processing systems using delta modulation. The natural features of the method are analyzed for the case of differential and gradient operations over multispectral images. On the basis of this method, an efficient computational procedure of comparison with a reference pattern is developed. The possibilities of delta modulation in express video-processing ground systems are demonstrated by means of specialized devices operating in real time,

for example, the analyzer of multispectral homogeneities. An on-board system for data acquisition and data processing based on delta modulation is described.

A81-47352 **Image quality for SPOT satellite - Specifications and budget.** G. Begni (Centre National d'Etudes Spatiales, Paris, France). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-104*. 12 p.

The SPOT satellite, based on the CCD detector arrays, is to provide high resolution images of the earth surface in the visible and near-infrared domain as well as allow nadir viewing. The data products delivered by the ground image segment of the SPOT satellite program will be distributed over three levels in accordance with required accuracy. The products are rated on their radiometric and geometrical qualities: the radiometric image quality is the restitution accuracy of the measurement made by the satellite; its specifications lie in the accuracy of the signal to noise ratio, linearity, the relative accuracy between spectral bands, the relative multitemporal accuracy, the absolute accuracy, and the transfer function. Specifications of the geometrical image quality usually apply to vertical viewings and scenes with restricted altitude variations: localization accuracy, changes in lengths, anisomorphism, local coherence, multispectral superimposability, and relief restitution.

A81-48473 **Image correlation algorithms.** B. Makarovic (International Institute for Aerial Survey and Earth Sciences, Enschede, Netherlands). *ITC Journal,* no. 1, 1981, p. 32-59. 25 refs.

Concepts and techniques for image correlation in photogrammetry are reviewed. The discussion includes the definition of image correlation systems, a classification of the various approaches, a brief description of the basic operations involved and their modifications, identification of the problem areas and possible solutions, and an estimate of the development trends. Image correlation is considered in the context of automatic generation of x-(or epipolar) parallaxes.

A81-4[illegible]52 **Radar-optical-topographic transformations for scene content analysis.** C. A. McPherson, J. J. Hwang, and E. L. Hall (Tennessee, University, Knoxville, TN). In: EASCON '80; Electronics and Aerospace Systems Conference Arlington, VA, September 29-October 1, 1980, Conference Record. New York, Institute of Electrical and Electronics Engineers, 1980, p. 355-359. 6 refs. Contract No. F07401-78-C-0193.

A general method for transformations from one image to another is described and demonstrated for a typical radar-optical-topographic scene. The technique requires no visual correlation of pixels, although a knowledge of the position and orientation of the radar imaging system is needed. The theoretical concept of optical to radar transformation is explained through a mathematical model of the process, which derives a set of equations from six radar and three optical reference pixels. The technique is implemented by locating the position and orientation information of the chosen radar scene from previously generated data files, and selecting the region of the aerial photography that is assumed to contain the radar image. An error analysis is made, and the calculation error is reduced through software and visual inspection. Due to the ease of use and versatility of the technique, it requires less time than those methods which require a visual correlation of pixels within the two scenes, and is applicable to other types of scene matching.

A81-48693 # **Selection of reference zones for the automatic coordinate control of space images (Vybor opornykh uchastkov dlia avtomaticheskoi koordinatnoi priviazki kosmicheskoi videoinformatsii).** G. A. Avanesov, V. A. Vavaev, and V. E. Verbin (Akademiia Nauk SSSR, Institut Kosmicheskikh Issledovanii, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 91-95. 16 refs. In Russian.

Initial prerequisites and experimental data are presented, concerning an approach for selecting the reference zones for the automation of the coordinate control of images of the earth's surface, using data from space imagery systems. Based on the analysis of experimental results using actual images, a conclusion is made about the possible volume of an automatic catalog of standard reference zones. The main aspects of the method for selecting reference zones on the earth's surface include: (1) scanning and contouring on images of characteristic zones, satisfying geographical and physical requirements; (2) selecting the spectral range to describe the standard reference zones; (3) selecting the reference zones from contour zones on images, satisfying the maximum criterion for the parameter of nonuniformity; and (4) studying the temporal instability of the reference zones and determining the possible periods of dynamic correction of standards.
J.F.

A81-48694 # **Geometric correction of scanner images of the earth's surface (K voprosu o geometricheskoi korrektsii skanernykh snimkov zemnoi poverkhnosti).** V. I. Khizhnichenko. *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 96-103. 7 refs. In Russian.

Space images of the earth, obtained from on-board TV scanning systems, are subject to geometric distortions, caused by a number of factors. The correction of these distortions is accomplished by computer, and the processing algorithms are developed for maximum speed to meet operational requirements. Expressions are obtained for recalculation of the coordinates of pixels, accomplished during the correction process, based on a mathematical model of scanner image acquisition. Examples of the processing of actual images of the earth's surface using the algorithms are presented.
J.F.

A81-48772 # **Derivation of formulas for the correlation of coordinate points of different-scale photographs and quasi-photographs (Vyvod formul sootnosheniia koordinat tochek raznomasshtabnykh fotosnimkov i kvazisnimkov).** M. V. Shul'min. *Geodeziia i Aerofotos'emka,* no. 3, 1981, p. 55-60. In Russian.

Formulas are derived that correlate the coordinate points of a place depicted on different-scale photographs obtained by aerial cameras with different focal distances and on processed photographs (so-called quasi-photographs). Electronic stereoscopic equipment has been developed for the image transformation of the different-scale photographs; this equipment makes it possible to transform photographic signals into electrical video signals on the basis of the mathematical relationships that have been derived. The application of this method of stereotopographic cartography is discussed. B.J.

A81-48773 # **The influence of the accuracy of determining the elements of the external orientation of a stereopair on the processing of aerial photographs on the basis of adjusting elements (Vliianie tochnosti opredeleniia elementov vneshnego orientirovaniia stereopary na protsess obrabotki aerosnimkov po ustanovochnym elementam).** T. A. Bashkova. *Geodeziia i Aerofotos'emka,* no. 3, 1981, p. 67-73. In Russian.

The paper investigates a method for determining the external-orientation elements of stereopairs by means of double photogrammetric resection. Attention is given to the influence of mean square errors in the external-orientation elements on the accuracy of computation of adjusting elements for scales of stereophotogrammetric devices and coordinate points.
B.J.

A81-48943 **A practical method for the verification of computer-processed Landsat data.** J. Hadley, Jr. (Northeast Ohio Four-County Regional Planning and Development Organization, Akron, OH) and T. L. Nash (Akron, University, Akron, OH). *Remote Sensing Quarterly,* vol. 3, Jan. 1981, p. 29-37. 9 refs. Research supported by the University of Akron.

A data verification technique is presented which can be adapted for use at most map scales and is relatively inexpensive, efficient, and requires a minimum of staff training. The technique is presented in the context of a study designed to test the reliability of processed LANDSAT cover data for Ohio for three distinct physiographic areas of the state. It is found to be adequate for generating the data's accuracy of statistics. It is noted that the methodology can be replicated for use with other polygon or grid cell geocoded information systems by altering, if necessary, the cell size used for pixel alignment.
C.R.

A81-49345 * **ICAP - An Interactive Cluster Analysis Procedure for analyzing remotely sensed data.** S. W. Wharton (NASA, Goddard Space Flight Center, Earth Resources Branch, Greenbelt, MD) and B. J. Turner (Pennsylvania State University, University Park, PA). *Remote Sensing of Environment,* vol. 11, Sept. 1981, p. 279-293. 30 refs.

An Interactive Cluster Analysis Procedure (ICAP) was developed to derive classifier training statistics from remotely sensed data. ICAP differs from conventional clustering algorithms by allowing the analyst to optimize the cluster configuration by inspection, rather than by manipulating process parameters. Control of the clustering process alternates between the algorithm, which creates new centroids and forms clusters, and the analyst, who can evaluate and elect to modify the cluster structure. Clusters can be deleted, or lumped together pairwise, or new centroids can be added. A summary of the cluster statistics can be requested to facilitate cluster manipulation. The principal advantage of this approach is that it allows prior information (when available) to be used directly in the analysis, since the analyst interacts with ICAP in a straightforward manner, using basic terms with which he is more likely to be familiar. Results from testing ICAP showed that an informed use of ICAP can improve classification, as compared to an existing cluster analysis procedure. (Author)

A81-49768 # **An investigation of the autocorrelation function of radar images.** L. Alexander (General Electric Co., Space Div., Philadelphia, PA) and H. Kritikos (Pennsylvania, University, Philadelphia, PA). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 153-160. 12 refs.

Three digital radar data sets are examined and their autocorrelation functions are computed. The autocorrelation functions are found to be substantially lower than those of visible images. The effects of resampling on imagery with this lower correlation coefficient are examined. The implication of these findings for information extraction from radar images is that spatial properties contribute a significant amount of information to classification success. The implication of the result for data compression suggests the improved performance of the Even Discrete Sine Transform for the compression of radar imagery. B.J.

A81-49780 # **Cartographic accuracy of synthetic aperture radar imagery.** E. E. Derenyi and J. L. Szabo (New Brunswick, University, Fredericton, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 287, 288. Research supported by the Department of Energy, Mines and Resources of Canada.

The cartographic accuracy of microwave imagery is investigated to ascertain geometric characteristics of imagery recorded by a synthetic aperture radar installed in the Convair-580 aircraft. Imagery is acquired in three passes, each line approximately 60 km long, with a sensor operating in a shallow angle mode at a depression angle of 24.4 deg to the center of the beam. Accuracy of the geographic position of points from SAR imagery is found to be a function of the density of control points and the length of the strip, and it is concluded that SAR-850 imagery has potential as a source of information for the revision of 1:50,000 scale maps when mathematical transformation and digital mapping techniques are employed. D.L.G.

A81-49793 # **Digital enhancements for vegetation mapping in a subarctic environment.** I. L. Johnston and P. J. Howarth (McMaster University, Hamilton, Ontario, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 405-412. 17 refs. Research supported by McMaster University; Natural Sciences and Engineering Research Council of Canada Grant No. A-5586.

Experiments have been undertaken to determine the most appropriate digital Landsat enhancements for mapping subarctic vegetation. Landsat data of the Hook Point area in northern Ontario recorded in June, July, and September were used in the study. Linear contrast stretch, band ratioing, video filtering and principal components enhancements were applied to the data. A visual assessment of the results was made to determine the capabilities of each enhancement to differentiate bog, fen and transitional vegetation cover. The effect of the enhancement algorithms on the digital values was also studied in small test areas. The different color renditions between a standard color composite and an atmospherically corrected composite demonstrate the effects of the solar and atmospheric corrections. The linear contrast stretch provided more vegetation information than the composites. However, band ratioing, video filtering and principal components enhancements did not provide satisfactory images of the vegetation. B.J.

A81-49795 # **Computer analysis of Tiros-N/NOAA-6 satellite data for operational snow cover mapping.** S. E. Waterman, W. D. Hogg, A. J. Hanssen, and V. L. Polavarapu (Department of the Environment, Atmospheric Environment Service, Downsview, Ontario, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings.
Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 435-442. 11 refs.

A81-49804 * # **Investigation of multispectral remote sensing of snow cover using a solar radiation model.** S. E. Waterman (Department of the Environment, Atmospheric Environment Service, Downsview, Ontario, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 525-540. 29 refs. Grant No. NGL-06-003-200.

A solar radiation model is described which is able to calculate, for given atmospheric and topographic input conditions, the spectral distributions of the direct and diffuse components of the total irradiance incident upon a target surface. The irradiance includes both upwelling radiation backscattered toward the earth's surface and radiation reflected toward the target from other terrain surfaces. Spectral reflectance data for two dissimilar snow types are fed into the model, along with a geometric description of the topography of the snow covered terrain. These data permit the calculation of the exitance of the target over the wavelength limits of a given sensor and, hence, the apparent contrast between the two snow types for the given input conditions. The results show that the contrast between the two snow types, all other factors being constant, is greatest in the near infrared wavelengths. C.R.

A81-49808 # **Role of aerial photographs in classification of Landsat data.** W. A. Miller, G. R. Johnson (Technicolor Graphic Services, Inc., Sioux Falls, SD), and W. G. Rhode. In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 575, 576. 5 refs.

A81-49812 # **Histogram estimation for multiple-detector sensors.** W. M. Strome (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 603-608.

It is shown that with relatively minor modification, peak and valley seeking clustering algorithms can be made more effective by adjusting the histograms of radiometrically corrected multidetector per channel data, such as those from the Landsat MSS as described. The slightly more complicated procedure produces a histogram which much more closely approximates the original intensity probability distribution function than that of either the raw or radiometrically corrected data. C.R.

A81-49813 # **Comparative experimental study on the use of original and compressed multispectral Landsat data of the Bayuda desert.** K. A. Ulbricht (Deutsche Forschungs- und Versuchsanstalt fur Luft- und Raumfahrt, Institut für Nachrichtentechnik, Oberpfaffenhofen, West Germany). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 609-616. 5 refs.

An excerpt from a multispectral Landsat scene, compressed by a ratio of 6.4/1, is investigated to determine the effect of the compression on the image contents. The study is based on several years of image processing activities on Landsat scenes of North African territories, in particular the Landsat image of February 5, 1973, of the Bayuda desert in the Sudan. This image was submitted to supervised maximum likelihood classification before and after compression of data as a function of the rejection class parameter sigma. Different approaches to the use of circular or rectangular training areas, before and after their compression, for classification on original and compressed scene, were used in investigating the influence of compression on image contents. With the aid of five training areas for classification, partitioning of classified image,

original as well as compressed, is given on a percentage basis as a function of sigma.

CSCL 02C

Early season changes in optical depth change brightness, primarily along the soil line; and during crop development, changes in optical depth change both greenness and brightness. Thus, the existence of haze in the imagery could cause an unsuspecting analyst to interpret the spectral appearance as indicating an episodal event when, in fact, haze was present. The techniques for converting LANDSAT-3 data to simulate LANDSAT-2 data are in error. The yellowness and none such computations are affected primarily. Yellowness appears well correlated to optical depth. Experimental evidence with variable background and variable optical depth is needed, however. The variance of picture elements within a spring wheat field is related to its equivalent in optical depth changes caused by haze. This establishes the sensitivity of channel 1 (greenness) pixels to changes in haze levels. The between field picture element means and variances were determined for the spring wheat fields. This shows the variability of channel data on two specific dates, emphasizing that crop development can be influenced by many factors. The atmospheric correction program ATCOR reduces segment data from LANDSAT acquisitions to a common haze level and improves the results of analysis.

CSCL 12A

A Bayesian technique for stratified proportion estimation and a sampling based on minimizing the mean squared error of this estimator were developed and tested on LANDSAT multispectral scanner data using the beta density function to model the prior distribution in the two-class case. An extention of this procedure to the k-class case is considered. A generalization of the beta function is shown to be a density function for the general case which allows the procedure to be extended.

CSCL 12A

The decomposition of mixture density of the data into its normal component densities is considered. The densities are approximated with first order dependent feature trees using criteria of mutual information and distance measures. Expressions are presented for the criteria when the densities are Gaussian. By defining different types of nodes in a general dependent feature tree, maximum likelihood equations are developed for the estimation of parameters using fixed point iterations. The field structure of the data is also taken into account in developing maximum likelihood equations. Experimental results from the processing of remotely sensed multispectral scanner imagery data are included.

ESTIMATION OF PROPORTIONS IN MIXED PIXELS THROUGH THEIR REGION CHARACTERIZATION
C. B. Chittineni, Principal Investigator Mar. 1981 38 p refs
Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15800; Proj. AgRISTARS)
(E81-10199; NASA-CR-161001; SR-L1-04067; LEMSCO-16021; JSC-17124) Avail: NTIS HC A03/MF A01 CSCL 12A

A region of mixed pixels can be characterized through the probability density function of proportions of classes in the pixels. Using information from the spectral vectors of a given set of pixels from the mixed pixel region, expressions are developed for obtaining the maximum likelihood estimates of the parameters of probability density functions of proportions. The proportions of classes in the mixed pixels can then be estimated. If the mixed pixels contain objects of two classes, the computation can be reduced by transforming the spectral vectors using a transformation matrix that simultaneously diagonalizes the covariance matrices of the two classes. If the proportions of the classes of a set of mixed pixels from the region are given, then expressions are developed for obtaining the estmates of the parameters of the probability density function of the proportions of mixed pixels. Development of these expressions is based on the criterion of the minimum sum of squares of errors. Experimental results from the processing of remotely sensed agricultural multispectral imagery data are presented. A.R.H.

(PB81-185555; ITEK-81-8449A-2; USGS/NMD-81-001) Avail: NTIS HC A14/MF A01 CSCL 08B

A concept for mapping and monitoring the Earth's surface from space involves obtaining elevation data from the use of the epipolar-plane condition in space. This greatly simplifies the mapping problem by permitting the automated processing of stereo data into digital elevation data. Multicolored image maps at 1:50,000 scale with 20-m contours are indicative of the products which are within the capability of the Mapsat system. Mapsat would provide continuity with respect to LANDSATS 1-3, including the same basic data transmission system. GRA

(Contract DAAK70-79-C-0153)
(AD-A101321; ETL-0241) Avail: NTIS HC A09/MF A01 CSCL 09/2

Man-machine interactive digital image processing techniques were applied to the extraction of terrain analysis data from aerial imagery were investigated. Emphasis is given to the extraction of vegetation data elements from digitized panchromatic photograhy, with a small amount of attention given to thermal infrared and side-looking radar imagery. Vegetation data elements listed in the USAETL Terrain Analysis Procedural Guide for Vegetation are addressed in varying degrees of depth. Interactive digital techniques are developed for vegetation/land cover boundary extraction, and for the extraction of several forest related data elements. The extraction techniques are developed using an interactive digital image analysis system-the General Elecric DIAL (Digital Image Analysis Laboratory). Results are compared in two cases to those achieved via existing manual analysis procedures. Author (GRA)

FOURIER MODULUS IMAGE CONSTRUCTION Final Technical Report, 7 Sep. 1979 - 30 Sep. 1980
James E. Fienup May 1981 70 p refs
(Contract F30602-80-C-0002)
(AD-A101728; RADC-TR-81-63) Avail: NTIS HC A04/MF A01 CSCL 04/1

This report describes the investigation of a new method for recovering diffraction-limited images through the turbulent atmosphere. It consists of an iterative algorithm that constructs an image from Fourier modulus data which is measured by stellar speckle interferometry. Research results indicate that the method has the potential for providing diffraction-limited images of Earth-orbiting satellites. Image construction experiments were performed on Fourier modulus data computer-simulated to include the effects of atmospheric turbulence, diffraction, photon (Poisson statistics) noise, and a finite number of short-exposure images. The quality of the constructed images was found to degrade in a gradual and predictable manner as the signal-to-noise ratio decreases. The rms error of the constructed images was found to vary approximately as the square root of the rms error of the Fourier modulus data. Diffraction-limited images were constructed for levels of photon noise that would be expected for imaging satellites through a 1.6-meter telescope. Image construction experiments were performed on the Fourier modulus of a number of different objects of varying complexity. Interpretation of the results was complicated by a tendency of the algorithm to stagnate at local minimum having the appearance of a good quality image superimposed by a pattern of stripes. Nevertheless, results were suggestive that the solution is usually unique. GRA

KNOWLEDGE-BASED IMAGE ANALYSIS Progress Report, 1 Sep. 1978 - 1 Dec. 1980
George C. Stockman, Barbara A. Lambird, David Lavine, and Laveen N. Kanal Apr. 1981 243 p refs
(Contract DAAK70-77-C-0110)
(AD-A101319; ETL-0258) Avail: NTIS HC A11/MF A01 CSCL 09/2

The work reported was directed toward employing a priori knowledge in the automatic analysis of aerial imagery. Major objectives of the research were directed toward (1) map-guided registration; (2) verification of geographic data bases extracted from imagery; (3) enrichment of geographic data bases; and (4) automatic terrain feature extraction using multiple sources of knowledge and multi-level decision making. The key component in all of the work was the matching of existing iconic structure in a geographic data base (GDB) with detected image structure. By using iconic knowledge, the image interpretation paradigm becomes a three step process. First, some primitive features of the imagery must be recognized without any area-specific knowledge. Second, the imagery is aligned or registered with the knowledge base by drawing correspondences between the image features and their iconic analogues in the GDB. The matching is formalized by derivation of a transformation which maps points (x,y) of the image to points (u,v) in GDB coordinates. The final step of the process is the analysis of those parts of the image which were not successfully interpreted in steps 1 and 2. This implies a top-down search for image structures which correspond to features in the GDB. Section 2 of the report treats primitive extraction. The emphasis is currently on lineal, point, and region features only. A method for automatically inferring a rotation and translation transforming image to map is given in Section 3. Classification of registered regions is discussed in Section 4. Verification of lineal GDB features in gray-scale imagery is introduced in Section 5. Author (GRA)

A TECHNIQUE FOR LINE EXTRACTION FROM LANDSAT MULTI-SPECTRAL SCANNER SATELLITE DATA WITH SOME APPLICATIONS OF THE TECHNIQUE

A. H. Benny Jan. 1981 42 p refs

(RAE-TR-81010; RAE-SPACE-592; BR78637) Avail: NTIS HC A03/MF A01

An automated technique is described for extracting lines from LANDSAT multispectral scanner images by means of density contour threading of the data. Lines are stored in the form of a series of X, Y coordinate pairs, sufficient coordinates being present to define each line with the required amount of detail. At a given contour level all possible lines are constructed which thread through the grid such that all locations to one side have a higher or similar value and all locations to the other side have a lower value. The image will in general yield several separate contour lines at any specified contour level. The method of searching for individual contour lines is based upon the observation that a line must run between any two adjacent pixels if one of them has a lower radiance value and the other a higher value than the selected level for the boundary line. If the selected level is the same as a pixel value, the line must run through that pixel, and to avoid missing this condition the test is altered to include the case in which one pixel has a lower value and the other a value greater than or equal to the selected level.

CATEGORIZATION OF NORTHERN GREEN BAY ICE COVER USING LANDSAT 1 DIGITAL DATA: A CASE STUDY

George A. Leshkevich Jan. 1981 25 p refs

(PB81-200438; NOAA-TM-ERL-GLERL-33; NOAA-81032301) Avail: NTIS HC A02/MF A01 CSCL 08I

Northern Green Bay ice cover on February 13, 1975, was analyzed using LANDSAT 1 digital data on the computer facilities at the Environmental Research Institute of Michigan. Training sets, consisting of selected areas in the LANDSAT scene that represent various ice types, were entered based upon the tone, texture, and location of the ice within the bay. The classification algorithm used in the analysis consisted of a modified maximum likelihood procedure using the multivariate Gaussian probability density function. It was found that seven ice types could be differentiated in the ice cover, that new (thin) ice could be distinguished from water, and that ice could be distinguished from relatively thin cloud cover.

WAVE ORBITAL VELOCITY, FADE AND SAR RESPONSE TO AZIMUTH WAVES

R. K. Raney *In* ESA Coherent and Incoherent Radar Scattering from Rough Surfaces and Vegetated Areas May 1981 p 63-70 refs Submitted for publication

Avail: NTIS HC A08/MF A01

Orbital velocity bunching as an explanation of the response of SAR is proposed, and the restraint of the coherence time of the scattering centers is considered. Key results in random scene image theory as applied to the azimuth wave problem are summarized. Doppler shifts are shown to be a function of wave and sensor geometry. The first order consequence of orbital motion is shown to induce a redistributed scatterer density that may be considered independently from specific SAR performance parameters and the new density can be convolved with the SAR transfer function to derive the expected output image. Focus perturbation of azimuth wave imagery is observed to occur, but only for a specific subset of wave length and wave height circumstances. Scatterer fade is shown to be of central importance in the SAR transfer function.

A REVIEW OF VOLUME SCATTER THEORIES FOR MODELING APPLICATIONS

A. K. Fung *In* ESA Coherent and Incoherent Radar Scattering from Rough Surfaces and Vegetated Areas May 1981 p 83-92 refs

(Grants NSF ENG-79-09374; DAAG29-80-K-0018)
Avail: NTIS HC A08/MF A01

Volume scatter theories commonly applied to develop scatter models for vegetation, snow and sea ice are reviewed. These include the first-order theories based on the Born approximation and the renormalization method, and the multiple scatter theories based on the radiative transfer method and the matrix doubling method. The merits of these scattering theories are compared with those developed by Twersky and Rytov. Applications of the scatter models developed from a first-order theory and a multiple scatter theory are illustrated.

SCATTERING THEORY WITH APPLICATION TO SYNTHETIC APERTURE RADAR

S. Rotheram *In* ESA Coherent and Incoherent Radar Scattering from Rough Surfaces and Vegetated Areas May 1981 p 93-98 refs

Avail: NTIS HC A08/MF A01

A Green's function scattering theory is outlined analogous to the T-matrix scattering theory of quantum mechanics and using an integral equation of the Lippman Schwinger type. To apply the scattering theory to microwave imaging the Green's function representations are combined with a system model. A number of SAR imaging mechanisms are identified. These include complex Bragg waves, azimuthal tilting, a motion effect cut-off and a temporal resolution effect. An application to SAR 580 processing is indicated.

OPTIMAL POLARIZATION CONCEPT IN RADAR IMAGING

Wolfgang-M. Boerner *In* ESA Coherent and Incoherent Radar Scattering from Rough Surfaces and Vegetated Areas May 1981 p 129-142 refs Sponsored also by Humboldt Fellowship National Science and Engineering Research Council of Canada and NATO

(Contracts N00014-80-C-0708; N00014-80-C-0073; Grant DRXR-OPR-P-17227-EL)
Avail: NTIS HC A08/MF A01

Polarization as a factor of electromagnetic scattering is discussed. Due to the vector nature of electromagnetic waves, electromagnetic remote sensing and inverse scattering techniques, if applied rigorously, require incorporation of polarization information into their formulation. By applying this approach to existing and some novel theories, improvements in quality and fidelity of the reconstructed profiles and/or images can be obtained. The development of methods and theories of vector inverse scattering for the electromagnetic polarization-dependent case or in the more complicated seismic case of p and s-wave interaction in elastic media, as for example in Vertical Seismic Profiling, is advocated. Radar scattering matrices and radar measurables are described, as are polarization descriptors.

SCATTEROMETER CALIBRATION AND DATA CORRECTION

Richard K. Moore *In* ESA Coherent and Incoherent Radar Scattering from Rough Surfaces and Vegetated Areas May 1981 p 149-163
Avail: NTIS HC A08/MF A01

Calibration of radars used for scatterometer purposes and the calibrations necessary to recover the scattering coefficient from the data are discussed. If calibration permits repeatable measurements the system has good relative calibration. Absolute calibration is needed to compare measurements made by different systems or when design data for new systems is needed. Relative calibration may best be done by using a sample of the transmitted signal as a test signal to determine receiver response. Absolute calibration requires either separate calibrations of each part, which are then combined, or the return from a standard target may be used to calibrate the entire system. Surface and volume scatter calculations are illustrated for various situations. Author (ESA)

PARTIALLY AUTOMATED OBJECT EXTRACTION FROM AERIAL PHOTOGRAPHS AND LAND MAPS [TEILAUTOMATISCHE OBJELTEXTRAKTION AUS LUFTBILDERN UND LANDKARTEN]
U. Bausch, W. D. Groch, W. Kestner, and M. Sties *In its* Rept. on Cartography and Geodesy, Ser. 1 1980 p 7-22 refs In GERMAN; ENGLISH summary

Avail: NTIS HC A07/MF A01

Object controlled object extraction procedures are presented. Compared with systematic area covering methods such procedures are expected to use less computer time at lower error rates. The principles of methods for extracting linear, surface, and point features are explained, and their accuracy and quality are discussed. The local judgement of gray value profiles for the determination of object outlines is dealt with in detail. One dimensional operators are introduced assigning evaluation numbers to the image points of an image extract. The higher the number, the higher the probability is for a point to lie on a contour. In this way candidates for an object outline are filtered from the selected image range. The various methods were simulated on a computer and tested using different imagery material. Results are shown. Author (ESA)

COMPARISON OF LABORATORY REFLECTANCE SPECTRA AND LANDSAT MULTISPECTRAL IMAGES OF HAWAIIAN LAVA FLOWS
Diane L. Evans, Tom G. Farr, and John B. Adams, Principal Investigators 1981 34 p refs Submitted for publication Sponsored by NASA Original contains imagery. Original photography may be purchased from the EROS Data Center, Sioux Falls, S.D. 57198 ERTS
(E81-10061; NASA-CR-164748) Avail: NTIS HC A03/MF A01 CSCL 08K

Laboratory reflectance spectra of samples with known compositions were compared to LANDSAT multispectral image of Hawaii. The technique used involves determining what the spectral response of a material of interest is at different wavelengths based on laboratory measurements, and searching a stack of spatially registered multispectral images for picture elements with the desired spectral signature. A relatively simple atmospheric correction was employed that combined the effects of gaseous absorption, Rayleigh, and anisotropic aerosol scattering. Laboratory spectal reflectance measurements of surface samples from Hawaii were found to allow mapping of a similar material over many square kilometers in the Hawaii LANDSAT frame, and that correspondence with the known geology and vegetation is excellent. The technique can be generalized to incorporate any bandpasses, and, therefore, has potential for identifying and mapping rock and vegetation types remotely. A.R.H.

Several techniques were developed and tested for increasing the performance of analog or analog/binary systems which perform calculations of Gaussian pattern classification of multispectral data. All the techniques involve scaling of data parameters. The two major sources of inaccuracies in the system are random noise and unpredictable shifts in the zero point. Input scaling, covariance scaling, and x-u scaling are discussed. Application of the these techniques with the prototype system developed resulted in successful classification of land and water with zero errors. A.R.H.

DEVELOPMENT OF ALTERNATIVE DATA ANALYSIS TECHNIQUES FOR IMPROVING THE ACCURACY AND SPECIFICITY OF NATURAL RESOURCE INVENTORIES MADE WITH REMOTE SENSING DATA
Thomas M. Lillesand, Principal Investigator *In its* A Study of Minn. Land and Water Resources Using Remote Sensing, Vol. 14 1 Jan. 1981 14 p ERTS

Avail: NTIS HC A05/MF A01 CSCL 05B

The applicability of digital LANDSAT data in updating the Minnesota Lake Land Management Information System and in assessing the trophic status of lakes was investigated. Data from various combinations of training, classification, and geometric correction techniques were compared to a photointerpreted reference data set consisting of ground-verified samples and six randomly selected photographs covering approximately one quarter of the study area. For a reconnaissance inventory, the training via polygons selected from aerial photographs with a canonical analysis minimum distance classifier is the most accurate and efficient analysis technique. The applications test project resulted in disappointing thematic classification results per se, but did contribute to the development of mechanisms for implementing a LANDSAT data processing capability in the State Planning Agency on a permanent basis. Removal of such pixels prior to interpretation would avoid erroneous conclusions about Earth surface conditions such as extent and severity of, for example, droughts and freezes and their probable economic impact due to crop losses. The results of a cluster screening procedure applicable to daytime satellite coverage when reflective (VIS) and emissive (IR) band data are obtained were examined. For a 3 Jul 78 HCMM daytime scene, twenty-eight VIS digital values each accounted for over 1.0% of the pixels in the south Texas test area. The VIS digital value of 42, associated with land features, exceeded all others in frequency of occurrence, accounting for 5.6% of all pixels in the daytime scene. The most common IR digital count value was 80 which was common to both land and water. It accounted for 2.6% of the pixels. T.M.

SOME METHODS OF MULTITEMPORAL ANALYSIS OF LANDSAT IMAGES RESULTING FROM A STUDY ON VENICE LAGOON

Angelo Zandonella, Principal Investigator 1980 5 p refs Presented at the Intern. Conf. on Image Anal. and Process., Pavia, Italy, Oct. 1980 Sponsored by NASA ERTS
(E81-10205; NASA-CR-164770) Avail: NTIS HC A02/MF A01 CSCL 08H

Two methods of analysis were developed. The first method concerns the multitemporal calibration of LANDSAT images. It consists of a projection, onto a common signals feature space, of images recorded in different time periods. The second method relates to multitemporal analysis of gravity center classes in the same feature space. The results obtained are discussed. T.M.

POSSIBLE APPLICATIONS OF COMMUNICATION SATELLITES FOR RESEARCH TASKS IN POLAR REGIONS Final Report

Gerhard Bommas, Erhard Hanka, Jork Haussmann, Walther Klages, Paul Stuerzenhofaecker, and Joachim Thomas Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 245 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-80-029; ISSN-0170-1339) Avail: NTIS HC A11/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 41

The possibilities of using communication satellites to establish beyond-the-horizon communications within Antartica, and between Antartica and the Federal Republic of Germany is examined. Communication is shown to be possible using the following satellites: Marisat for the transmission of speech, telex and data, GOES for the transmission of meteorological data, and TIROS-N for the reception of cloud pictures. The coverage of geostationary satellites is limited to a latitude of approximately 80 deg. Links, south of 80 deg are to be established by means of HF. Line of sight communication up to 50 km is simply established with VHF equipment. Author (ESA)

INSTRUMENTATION AND SENSORS

Includes data acquisition and camera systems and remote sensors.

A81-41476 **Some results on the investigation of earth resources by aerial and polygon methods (Nekotorye rezul'taty issledovaniia prirodnykh resursov s pomoshch'iu samoletnykh i poligonnykh sredstv).** Edited by N. K. Vinnichenko and A. P. Tishchenko. Leningrad, Gidrometeoizdat (Nauchno-Issledovatel'skii Tsentr Izucheniia Prirodnykh Resursov, Trudy, No. 10), 1980. 119 p. In Russian.

Papers are presented on integrated aerial-satellite remote sensing systems, the resolution of TV scanning systems, the transfer of spectral contrasts in multispectral photography, and pseudocolor representation of multispectral aerial images. Consideration is also given to the use of spectral and physical-geographic characteristics of natural objects on the earth's surface for the interpretation of multispectral satellite photographs, the determination of the types and state of crops from multispectral aerial images, and the automated classification of agricultural objects from their multispectral aerial images.

B.J.

A81-41477 # **Aerial data acquisition systems using test-ground polygons (Aviatsionnye sredstva sbora informatsii na kontrol'no-izmeritel'nykh poligonakh).** N. K. Vinnichenko, A. D. Dobrozrakov, and V. P. Iakovlev. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 3-12. In Russian.

Consideration is given to a remote sensing system based on the integration of satellite-borne and airborne sensors. It is shown that, when integrated into a satellite remote sensing system, aerial data acquisition systems (i.e., aircraft and helicopter platforms) can perform the independent function of data acquisition on test-ground polygons, and can solve various auxiliary problems in the interests of promoting the operation of the satellite system.

B.J.

A81-41483 # **Pseudocolor representation of multispectral aerial images by means of a three-channel projector (Psevdotsvetnoe predstavlenie mnogozonal'nykh aeroizobrazhenii s pomoshch'iu trekhkanal'nogo proektora).** A. N. Belinskii. In: Some results on the investigation of earth resources by aerial and polygon methods. Leningrad, Gidrometeoizdat, 1980, p. 42-44. In Russian.

Attention is given to the use of a three-channel projector for the synthesis of color images of one region of the earth's surface obtained at three different wavelengths. Results on the visual interpretation of several pseudocolor images of agricultural lands are discussed.

B.J.

A81-41915 # **The effect of angular distribution models on the estimation of the earth's albedo.** H. Jacobowitz (NOAA, Earth Sciences Laboratory, Marlow Heights, MD). *American Meteorological Society and Canadian Meteorological Oceanographic Society, Conference on Atmospheric Radiation, Toronto, Canada, June 16-18, 1981, Paper.* 3 p.

The considered investigation is concerned with the differences between the models that have been utilized in processing the narrow-angle data and the consequent effects of the differences on the estimation of the earth's albedo. The processing of the Nimbus-7 Earth Radiation Budget (ERB) narrow-angle data into hemispheric albedoes first made use of angular distribution models which consisted of angular distributions for three surface types, including cloud-land, ocean, and for latitudes greater than 65 deg snow and ice. A comparison of the zonal profiles of albedo utilizing these models with that derived from the wide-angle sensors showed rather large differences. To assess the cause of these differences, Stowe et al. (1980) conducted a comparison between these models and a preliminary one derived from a composite 9 day set of ERB radiance data. Data for a comparison between wide and narrow channel estimates of zonal means of the earth's albedo are presented in a table.

G.R.

A81-41916 # **A new numerical treatment of the source function in the radiative transfer equation.** H. E. Fleming (NOAA, National Earth Satellite Service, Washington, DC). *American Meteorological Society and Canadian Meteorological Oceanographic Society, Conference on Atmospheric Radiation, Toronto, Canada, June 16-18, 1981, Paper.* 4 p.

A81-41919 * # **A radiometric model of an earth radiation budget radiometer optical system with diffuse-specular surfaces.** M. R. Luther (NASA, Langley Research Center, Hampton, VA). *American Meteorological Society and Canadian Meteorological Oceanographic Society, Conference on Atmospheric Radiation, Toronto, Canada, June 16-18, 1981, Paper.* 9 p. 11 refs.

The Earth Radiation Budget Experiment (ERBE) is to fly on NASA's Earth Radiation Budget Satellite (ERBS) and on NOAA F and NOAA G. Large spatial scale earth energy budget data will be derived primarily from measurements made by the ERBE nonscanning instrument (ERBE-NS). A description is given of a mathematical model capable of simulating the radiometric response of any of the ERBE-NS earth viewing channels. The model uses a Monte Carlo method to accurately account for directional distributions of emission and reflection from optical surfaces which are neither strictly diffuse nor strictly specular. The model computes radiation exchange factors among optical system components, and determines the distribution in the optical system of energy from an outside source. Attention is also given to an approach for implementing the model and results obtained from the implementation.

G.R.

A81-41920 * # **Performance evaluation of a spaceborne scatterometer.** W. L. Grantham, E. M. Bracalente, W. L. Jones, Jr., L. C. Schroeder (NASA, Langley Research Center, Hampton, VA), C. L. Britt, Jr. (Research Triangle Institute, Hampton, VA), and F. J. Wentz (Remote Sensing Systems, Sausalito, CA). *Institute of Electrical and Electronics Engineers, Oceans '81 Conference, Boston, MA, Sept. 16-18, 1981, Paper.* 7 p. 7 refs.

Study results are presented showing performance capability of a spaceborne scatterometer to operationally measure ocean surface wind speed and direction. In addition, a research mode is described which will allow development of improved radar signatures for ocean, sea ice, and land targets. The study results show that a scatterometer can meet the operational requirements of + or - 2 m/s wind speed accuracy (or + or - 10%, whichever is greater) and + or - 20 deg wind direction accuracy over most of the expected ocean surface conditions. The six beam scatterometer design evaluated is shown to be skillful (greater than 90% correct) in specifying the correct wind vector solution (with a 180 deg ambiguity) from the multiple solutions derived; further improvement must rely on meteorological and pattern recognition techniques now under study.

A81-41995 **What has been learned from the scanning multi-channel microwave radiometers /SMMRs/.** J. Alishouse (NOAA, National Earth Satellite Service, Washington, DC). *Marine Technology Society Journal,* vol. 14, no. 6, 1980, p. 12, 13.

Two SMMRs have been flown, one on Seasat and the other on Nimbus-7. The two radiometers are essentially identical. Both have five frequencies, 6.63, 10.69, 18, 21, and 37 GHz and dual polarizations. Two algorithms have been used in the Seasat SMMR data processing to derive geophysical parameters. One is a nonlinear, least squares, iterative estimation technique, a type of Kalman filtering. The other is a regression technique with coefficients derived from simulation. The regression is essentially linear. Attention is given to sea surface temperature, sea surface wind speed, total precipitable water (water vapor), and corrections for the altimeter and the scatterometer.

G.R.

A81-42284 # **The signal-to-noise ratio of a space photographic system (Otnoshenie signal-shum kosmicheskoi fotograficheskoi sistemy).** L. M. Matiiasevich (Gosudarstvennyi Nauchno-Issledovatel'skii i Proizvodstvennyi Tsentr Priroda, USSR). *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 66-76. 11 refs. In Russian.

The concept of the signal-to-noise ratio is discussed in relation to a spaceborne photographic system used for the remote sensing of earth resources. The problems of a numerical determination of this value are considered, and it is shown that the signal is best characterized by three parameters: the density component (signal amplitude), the spatial dimension, and the frequency. A means for the practical application of this ratio is discussed. J.F.

A81-42285 # **Concerning the possibility of improving the spectroradiometric accuracy of remote sensing of the earth by means of multispectral band scanners (O vozmozhnom povyshenii spektroradiometricheskoi tochnosti pri distantsionnykh issledovaniiakh zemli s pomoshch'iu mnogozonal'nykh s'emochnykh sistem).** A. A. Bogdanov, V. N. Nalimov, A. G. Sychev, V. I. Tarnopol'skii, and G. N. Tolstykh (Akademiia Nauk SSSR, Institut Kosmicheskikh Issledovanii; Vsesoiuznyi Nauchno-Issledovatel'skii Institut Optiko-Fizicheskikh Izmerenii, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 77-84. 7 refs. In Russian.

Possibilities are discussed for decreasing the uncertainty of an object's emission spectrum by improving the accuracy of the calibration method and by applying a special processing method to the obtained data. It is shown that in measuring object brightness in several spectral bands, the true spectral dependence of brightness values can be determined by the method of successive approximation. The application of this technique to the remote sensing of the earth's surface by spaceborne multispectral band scanners is considered. J.F.

A81-42286 # **Concerning the reliability estimation of information obtained from several sources in earth survey tasks (Ob otsenke dostovernosti informatsii ot neskol'kikh istochnikov v zadache zemleobzora).** O. P. Nesterenko, Iu. A. Smol'ianinov, and S. D. Nadberezhnyi. *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 85-88. In Russian.

The problem of formulating a reliability estimation of information obtained simultaneously from satellite-borne remote sensing systems is presented. A complete a posteriori probability of the true message is averaged from several observed results and set as a function of a priori distribution. J.F.

A81-42671 * **Calibration validation for the GEOS 3 altimeter.** C. F. Martin (EG & G Washington Analytical Services Center, Inc., Riverdale, MD) and R. Kolenkiewicz (NASA, Goddard Space Flight Center, Greenbelt, MD). *Journal of Geophysical Research,* vol. 86, July 10, 1981, p. 6369-6381. 18 refs.

An absolute calibration of the altitude data is needed for some applications of the large quantity of altimeter data taken by the GEOS 3 intensive mode altimeter. The considered calibration technique is based on the use of a gravimetric geoid model and satellite passes which are nearly overhead at island laser tracking sites. Near overhead passes of GEOS 3 were achieved at Bermuda. Two of these passes were tracked by the Bermuda laser. The reported investigation has the objective to obtain a best estimate of the GEOS 3 altimeter calibration bias, using the two available passes and reconciling differences between them. Assuming that orbits with accurate altitudes over Bermuda are obtained, discrepancies between the two passes could be due to incorrect time tagging of the altimeter data. To assist in the resolution of the timing question, additional GEOS 3 passes through the calibration area were selected. On the basis of the obtained results, it is recommended to add 10.24 ms to GEOS 3 altimeter time tags before using the data. G.R.

A81-43071 * **Passive microwave techniques for geophysical sensing of the earth from satellites.** D. H. Staelin (MIT, Cambridge, MA). *IEEE Transactions on Antennas and Propagation,* vol. AP-29, July 1981, p. 683-687. 61 refs. Grant No. NAG5-10.

Passive microwave techniques for geophysical probing from aircraft and space have employed frequencies 1-300 GHz and have yielded information about atmospheric temperature and composition profiles and about surface parameters such as sea state, ice and snow type and extent, soil moisture, etc. The initially scientific program is now evolving into various operational spacecraft observatory systems; this mini-review summarizes recent accomplishments and future opportunities. (Author)

A81-43190 * **Advanced technology for satellite data collection systems.** C. E. Cote and J. E. Painter (NASA, Goddard Space Flight Center, Greenbelt, MD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 65-67. 6 refs.

Technological developments in satellite data collection are aimed at relieving constraints of existing systems to permit expanded capability at lower costs in future operations. Constraints imposed by the limited electromagnetic spectrum available in the UHF band and the cost of user equipment are principal targets for improvement through technology. This paper describes ongoing developmental activities in system and component areas which will become available for the next generation of operations. (Author)

A81-43223 * **Potential application of satellite radar to monitor soil moisture.** F. T. Ulaby, G. A. Bradley, and M. C. Dobson (University of Kansas Center for Reserach, Inc., Lawrence, KS). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 363-370. 29 refs. Contract No. NAS9-14052.

The microwave backscattering characteristics of soils as a function of moisture content are reviewed as a basis for the evaluation of the applicability of satellite radar to soil moisture determinations. Results of experiments showing the dependence of the complex dielectric constant, power reflection coefficient and backscattering coefficient of soil on its volumetric moisture content are presented. Results of a research program using the truck-mounted University of Kansas microwave active spectrometer to determine if, by the proper choice of sensor frequency, polarization and incidence, the sensor dynamic range in response to moisture variations may be greater than its response to other variations are considered in detail, and the optimum conditions of frequency (between 4 and 5 GHz), angular incidence (between 7 and 20 deg from nadir) and polarization (HH) obtained are indicated. An empirical model for the backscattering coefficient as a function of gravimetric moisture content derived on the basis of the experimental data is presented, and it is noted that available airborne and spaceborne data confirm the results of the ground-based sensors. A.L.W.

A81-43225 * **Requirements of space-borne microwave radiometers for detecting soil moisture contents.** H.-H. K. Burke (Environmental Research and Technology, Inc., Concord, MA) and W. J. Burke (Boston College, Chestnut Hill, MA). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 377-383. 13 refs. Contracts No. NAS5-25529; No. NAS5-25527.

A multilayer radiative transfer model for predicting the relationship between soil moisture content and microwave emission is summarized. Attention is also given to the performance of various microwave sensors for soil moisture retrieval; here, the requirements of a satellite sensor system for monitoring large-scale soil moisture conditions are discussed. These requirements are presented in terms of (1) the wavelength, (2) atmospheric contamination, (3) polarization, (4) frequency of observation, and (5) spatial resolution. Each parameter is discussed in terms of microwave response. Previous aircraft data with extensive ground truth information are used to support the theories proposed. Trade-offs between the parameters and an optimum sensor system for space monitoring soil moisture information are discussed. C.R.

A81-43260 * **Land subsidence measured by satellite radar altimetry.** W. B. Krabill (NASA, Wallops Flight Center, Wallops Island, VA) and R. L. Brooks (GeoScience Research Corp., Salisbury, MD). In: Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979. Minneapolis, MN, American Water Resources Association, 1981, p. 683-688. Contract No. NAS6-2639.

Radar altimeter measurements from the GEOS-3 and SEASAT satellites are being evaluated to assess their potential contribution to terrain mapping. The primary evaluation area is the San Joaquin Valley of southern California; 40,000/sq km of the Valley have been mapped at a contour interval of 10 m from the satellite altimeter measurements. The accuracy of the altimeter derived terrain elevations is being assessed by comparison with 1:24,000 and digitized 1:250,000 maps and by intercomparisons at the crossover altimeter intersections. Comparisons of the altimeter derived elevations with historical maps archived at the U.S. Geological Survey confirms the USGS 1926-1972 subsidence contours for this area. Preliminary results from a similar analysis in the Houston-Galveston area of subsidence also demonstrates a capability of measuring land subsidence by satellite altimetry. (Author)

A81-43530 **Hardware aspects of digital mapping.** G. Petrie (Glasgow, University, Glasgow, Scotland). *(International Society for Photogrammetry, Congress, 14th, Hamburg, West Germany, July 13-25, 1980.) Photogrammetric Engineering and Remote Sensing,* vol. 47, Mar. 1981, p. 307-320. 28 refs.

The respective merits of digitizing photogrammetrically produced graphic plots and direct photogrammetric digitizing are described. The characteristics of various types of photogrammetric digitizing units are discussed, including representative examples of large multistation systems. Particular consideration is given to the trend toward the implementation of standard hardware interfaces and the incorporation of graphic displays into photogrammetric digitizing systems. A summary is then given of experiences with interactive graphic systems interfaced directly to stereoplotting machines reported by a number of North American mapping agencies. B.J.

A81-43547 * **Aircraft active microwave measurements for estimating soil moisture.** T. J. Jackson (U.S. Science and Education Administration, Hydrology Laboratory, Beltsville, MD), A. Chang, and T. J. Schmugge (NASA, Goddard Space Flight Center, Greenbelt, MD). *Photogrammetric Engineering and Remote Sensing,* vol. 47, June 1981, p. 801-805. 7 refs.

Both active and passive microwave sensors are sensitive to variations in near-surface soil moisture. The principal advantage of active microwave systems for soil moisture applications is that high spatial resolution can be retained even at satellite attitudes. The considered investigation is concerned with the use of active microwave scatterometers for estimating near-surface soil moisture. Microwave scatterometer data were obtained during a series of three aircraft flights over a group of Oklahoma research watersheds during May 1978. Data were obtained for the C, L, and P bands at angles of incidence between 5 and 50 degrees. The best results were obtained using C band data at incidence angles of 10 and 15 degrees and soil moisture depth of 0 to 15 cm. These results were in excellent agreement with the conclusions of the truck-mounted scatterometer measurement program reported by Ulaby et al. (1978, 1979). G.R.

A81-43735 **Relating ground level reflected radiance measurements in the Landsat MSS bandpasses to satellite altitudes.** M. J. Duggin (New York, State University, Syracuse, NY) and P. J. Ellis (Department of Scientific and Industrial Research, Physics and Engineering Laboratory, Lower Hutt, New Zealand). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. RS-1-G-1 to RS-1-G-10. 16 refs. Research supported by the U.S. Department of Agriculture and New York State Department of Environmental Conservation.

Ground truth radiometers (GTRS) are used to test the feasibility of resource discrimination, mapping and quantification using Landsat digital multispectral scanner (MSS) data. The effect on differences of target spectral response for healthy and diseased vegetation is studied. The differences between recorded output from GTRS and the Landsat MSSs when viewing the same target under identical conditions are calculated. The average obtained for the mean normalized signal (NS) values in each bandpass of each MSS was used as a standard to which NS values calculated for the GTRs were compared. Although differences of up to 13% occurred in MSS 7, and two large differences (up to 20%) were found in MSS 5, general agreement (differences of 5% or less) was usual. This indicates that the GTRs, which are simple and inexpensive, can provide satisfactory ground reflectance data, which can be related accurately to Landsat data. J.F.

A81-45836 * # **Earth applications orbit analysis for a shuttle-mounted Multispectral Mapper.** J. M. Driver and C. C. H. Tang (California Institute of Technology, Jet Propulsion Laboratory, Mission Design Section, Pasadena, CA). *American Astronautical Society and American Institute of Aeronautics and Astronautics, Astrodynamics Specialist Conference, Lake Tahoe, NV, Aug. 3-5, 1981, AAS Paper 81-182.* 24 p. 8 refs. Contract No. NAS7-100.

The earth remote sensing problem of orbit design to acquire images with inherent geometric and geodetic accuracy is addressed. The basis for precise orbit modeling is discussed. Various orbit propagation tools are compared. Orbit characteristics for a nominal case at shuttle altitude are displayed. Modeling Parameter sensitivities are evaluated to determine limits on orbit propagation accuracy versus time. It is found that attainable propagation accuracies are sufficient for image quality assessment over the short term at the 15m pixel size desired for a Multispectral Mapper. (Author)

A81-45872 * **Progress in passive microwave remote sensing - Nonlinear retrieval techniques.** D. H. Staelin (MIT, Cambridge, MA). In: Remote sensing of atmospheres and oceans; Proceedings of the Interactive Workshop on Interpretation of Remotely Sensed Data, Williamsburg, VA, May 23-25, 1979. New York, Academic Press, Inc., 1980, p. 259-274; Discussion, p. 275, 276. 10 refs. Contract No. NAS5-22929.

A variety of nonlinear retrieval methods have been applied to passive microwave remote sensing problems. These problems can be characterized in part by the degree to which their underlying physics and statistics can be understood and characterized in a simple way. Four examples of varying complexity are considered here; the simplest problem requires only analytic expressions for retrievals, whereas the most complex problem has been handled only with pattern classification techniques. The four examples are: (1) Doppler measurements of winds at 70 to 100 km, (2) retrieval of atmospheric water vapor profiles using the opaque 183-GHz water vapor resonance, (3) retrieval of snow accumulation rate by means of combined theoretical and empirical procedures, and (4) classification of diverse polar terrain by means of pattern recognition techniques. (Author)

A81-45873 * **Inversion of multiwavelength radiometer measurements by three-dimensional filtering.** P. W. Rosenkranz and W. T. Baumann (MIT, Cambridge, MA). In: Remote sensing of atmospheres and oceans; Proceedings of the Interactive Workshop on Interpretation of Remotely Sensed Data, Williamsburg, VA, May 23-25, 1979. New York, Academic Press, Inc., 1980, p. 277-310; Discussion, p. 310, 311. 18 refs. Contract No. NAS5-22929.

Remote sensing data from satellites typically have three dimensions: scan position, spacecraft position, and wavelength. Inversion of the radiometric data to infer geophysical parameters is a filtering problem in which the dimension of wavelength (or channel number) is transformed into a dimension of geophysical parameters, and the most general solution is a three-dimensional filter. Linear filters have the advantages of computational speed and easily described transfer functions; but often the measurements are nonlinear functions of the parameters to be inferred. To the extent that the nonlinear inversion problem is overdetermined, it can be modeled by a critically determined linear problem. As an example, inversion of Scanning Multichannel Microwave Radiometer (SMMR) data by means of a three-dimensional Wiener Filter is described. Atmospheric water vapor content, rain liquid water content, surface wind speed and surface temperature are the parameters inferred from the measurements. Nonprecipitating liquid water and water vapor scale height are also modeled but not retrieved. The a priori statistics on which the filter is trained have the effect of governing the selection of a trade-off point of noise as a function of resolution (in all three retrieval dimensions). (Author)

A81-45879 * **Atmospheric correction of Nimbus-7 Coastal Zone Color Scanner imagery.** H. R. Gordon (Miami, University, Coral Gables, FL), J. L. Mueller (NASA, Goddard Space Flight Center, Laboratory for Atmospheric Sciences, Greenbelt, MD), and R. C. Wrigley (NASA, Ames Research Center, Moffett Field, CA). In: Remote sensing of atmospheres and oceans; Proceedings of the Interactive Workshop on Interpretation of Remotely Sensed Data, Williamsburg, VA, May 23-25, 1979. New York, Academic Press, Inc., 1980, p. 457-481; Discussion, p. 482, 483. 11 refs. Contract No. NAS5-22963.

The Coastal Zone Color Scanner (CZCS) on Nimbus-7 is a scanning radiometer designed to view the ocean in six spectral bands (centered at 443, 520, 550, 670, 750, and 11,500 nm) for the purpose of estimating sea surface chlorophyll and temperature distributions. In the visible bands, the atmosphere obscures the imagery to the extent that at 443 nm, at most, only 20 percent of the observed radiance originates from beneath the sea surface. Retrieving this subsurface radiance from the imagery is complicated by the highly variable nature of the aerosol's contribution. In this paper, an algorithm for the removal of these atmospheric effects from CZCS imagery is described, a preliminary application of the algorithm to an image with very strong horizontal variations in the aerosol optical thickness is presented, and retrieval of the spatial distribution of the aerosol optical thickness is discussed. (Author)

A81-46028 * **Parallel processing implementations of a contextual classifier for multispectral remote sensing data.** H. J. Siegel, P. H. Swain, and B. W. Smith (Purdue University, West Lafayette, IN). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 19-29. 19 refs. Contract No. NAS9-15466.

The applicability of parallel processing schemes to the implementation of a contextual classification algorithm which exploits the spatial and spectral context of a multispectral remote sensing pixel to achieve classification is examined. Two algorithms for classifying each multivariate pixel taking into account the probable classifications of neighboring pixels are presented which make use of a size three horizontally linear neighborhood, and the serial computational complexity of the more efficient algorithm is shown to grow in proportion to the number of pixels and the cube of the number of possible categories. The implementation of the more efficient algorithm on a CDC Flexible Processor system and on a multimicroprocessor system such as the proposed PASM is then discussed. It is noted that the use of N processors to perform the calculations N times faster than a single processor overcomes the principal disadvantage of contexual classifiers, i.e., their computational complexity.

A.L.W.

A81-46029 **Automatic processing of computer compatible tapes with data from multispectral scanners installed in Landsat satellites.** N. Scquizzato (Comisión Nacional de Investigaciones Espaciales, Buenos Aires, Argentina). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 30-39.

The design and operation of the STAI (Spanish acronym for ground data analysis system) for the digital processing of multispectral remote sensing data on computer compatible tapes are discussed. The interactive system consists of a central processing unit, main memory system, nine-track magnetic tape unit, magnetic tape controller, teletype, high-speed paper tape reader/punch, interface extension unit, sensor data input processor, black and white film recorder, tape playback unit, moving window display, color monitor, color film printing subsystem, operator panel, and tape operating system. Features to be added in the future include a table digitizer, color film digitizer and processor, and electrostatic printer plotter. Landsat CCTs can be displayed and processed using the moving window display as a first step in classification. Images are displayed at a vertical scale of 1:100,000 and horizontal scales of either 1:100,000 or 1:50,000.

A.L.W.

A81-46030 **The Lulea Image Processing System /LIPS/ - A versatile approach to earth resources data processing.** H. Hauska (Lulea, Hogskola, Lulea, Sweden). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 40-46. 14 refs. Styrelsen for Teknisk Utveckling Contracts No. 76-6669; No. 77-6345.

The minicomputer-based Lulea Image Processing System (LIPS), which was developed for earth resources data processing applications, is presented. The system was designed according to the available hardware (Nord 10/S CPU), and the criteria of ease of use, flexibility, portability, efficiency, ease of maintenance and batch capability. Image data files contain information on image identity and processing history as well as the image data itself quantized in grey scale values. The software is structured in two levels corresponding to a control program and processing level programs in the form of a pseudo-overlay. The modular processing modules include provisions for preprocessing, hard copy image output, orthogonal transformation, geometric correction, classification and the estimation of statistical parameters. Future improvements to the system include a color digital display system to provide true interactivity, and an image reading device.

A81-46038 * **Radar image preprocessing.** V. S. Frost, J. A. Stiles, J. C. Holtzman (University of Kansas Research Center, Inc., Lawrence, KS), and D. N. Held (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, West Lafayette, IN, June 3-6, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 140-146. 14 refs. Research supported by the California Institute of Technology; Contract No. NAS7-100; Grant No. DAAG29-77-G-0075.

Standard image processing techniques are not applicable to radar images because of the coherent nature of the sensor. Therefore there is a need to develop preprocessing techniques for radar images which will then allow these standard methods to be applied. A random field model for radar image data is developed. This model describes the image data as the result of a multiplicative-convolved process. Standard techniques, those based on additive noise and homomorphic processing are not directly applicable to this class of sensor data. Therefore, a minimum mean square error (MMSE) filter was designed to treat this class of sensor data. The resulting filter was implemented in an adaptive format to account for changes in local statistics and edges. A radar image processing technique which provides the MMSE estimate inside homogeneous areas and tends to preserve edge structure was the result of this study. Digitally correlated Seasat-A synthetic aperture radar (SAR) imagery was used to test the technique.

A81-46196 **Does the use of two radiometers correct for irradiance changes during measurements.** E. J. Milton (Durham, University, Durham, England). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Aug. 1981, p. 1223-1225. 9 refs.

The method of inter-calibrating two field radiometers proposed by Duggin (1980) is critically assessed. It is claimed that by this method it is possible to correct for the effects of variations in total solar irradiation upon hemispherical directional reflectance during a series of measurements. However, this is questioned because in theory, the non-Lambertian nature of most natural surfaces prevents such a correction. Furthermore, it is shown that in practice, intra-canopy shadow effects are likely to confound the proposed method. Uniform irradiation conditions are seen as the only suitable environment for the field measurement of reflectance factors.

A81-46241 * # **Magnetic space-based field measurements.** R. A. Langel (NASA, Goddard Space Flight Center, Geophysics Branch, Greenbelt, MD). *American Astronautical Society, Goddard Memorial Symposium on International Space Technical Applications, 19th, Arlington, VA, Mar. 26, 27, 1981, Paper 81-077.* 18 p. 18 refs.

Satellite measurements of the geomagnetic field began with the launch of Sputnik 3 in May 1958 and have continued sporadically in the intervening years. A list of spacecraft that have made significant contributions to an understanding of the near-earth geomagnetic field is presented. A new era in near-earth magnetic field measurements began with NASA's launch of Magsat in October 1979. Attention is given to geomagnetic field modeling, crustal magnetic anomaly studies, and investigations of the inner earth. It is concluded that satellite-based magnetic field measurements make global surveys practical for both field modeling and for the mapping of large-scale crustal anomalies. They are the only practical method of accurately modeling the global secular variation. Magsat is providing a significant contribution, both because of the timeliness of the survey and because its vector measurement capability represents an advance in the technology of such measurements.

A81-46401 **Identification of subresolution high temperature sources using a thermal IR sensor.** M. Matson (NOAA, National Earth Satellite Service, Washington, DC) and J. Dozier (California, University, Santa Barbara, CA). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Sept. 1981, p. 1311-1318. 14 refs.

Simultaneous use of the 3.8-micron and 11-micron thermal infrared channels on board the 3rd-generation NOAA-6 environmental satellite provides the capability to detect subresolution scale high-temperature sources, and to estimate both the temperature and size of such sources. Examples presented include gas flares from oil fields in the Middle East and steel mills in the midwestern United States. (Author)

A81-46461 **First Shuttle payload loading to begin.** C. Covault. *Aviation Week and Space Technology,* vol. 114, June 29, 1981, p. 54, 55, 57, 59.

The first Office of Space and Terrestrial Applications (OSTA 1) Space Shuttle payload, a multi-instrument array aimed at the development of oil and mineral exploration from space, will be carried into orbit by the second Columbia Orbiter mission. The Spacelab pallet mounting of the package incorporates: (1) the Shuttle imaging radar (SIR-A), which will study geological formations; (2) the Shuttle multispectral infrared radiometer; (3) a feature identification and location experiment; (4) an ocean color experiment; and (5) an air pollution measurement-from-satellite experiment. In one of the two OSTA 1 experiments to be conducted from the Shuttle cabin, photographic studies will be made of lightning propagation across thunderstorms. O.C.

A81-46679 **The European SAR-Project Convair 580 (Die Europäische SAR-Kampagne CV 580).** A. Sieber (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Hochfrequenztechnik, Oberpfaffenhofen, West Germany) and P. Hartl (Berlin, Technische Universität, Berlin, West Germany). *Bildmessung und Luftbildwesen,* vol. 49, Sept. 1, 1981, p. 165-170. In German.

The considered investigation is concerned with the possibilities and problems regarding an employment of Synthetic Aperture Radar (SAR) sensors in space missions with earth observation applications. The significance of the SAR Project for the European Microwave Remote Sensing program is discussed, taking into account the Microwave Remote Sensing Experiment, the establishment of national and international user organizations, and the support of research work related to radar systems. The organization of the entire project is considered along with the observational parameters for the SAR system. Test areas in Germany have been selected for a calibration of the SAR systems. Investigations related to snow and ice are to be conducted in Switzerland and Austria, while questions of glaciology and hydrology are to be studied in Greenland. G.R.

A81-46924 # **Radar methods for studying the earth (Radiolokatsionnye metody issledovaniia zemli).** Iu. A. Mel'nik, S. G. Zubkovich, V. D. Stepanenko, Iu. P. Sokolov, V. A. Gubin, V. E. Dulevich, S. V. Pereslegin, A. A. Veretiagin, V. M. Glushkov, and Iu. A. Iurkov. Moscow, Izdatel'stvo Sovetskoe Radio, 1980. 288 p. 118 refs. In Russian.

The principles of earth radar studies are presented. Models of reflection and characteristics of radar signals from land and water surfaces as well as atmospheric formations are discussed in detail. The methods for constructing and substantiating the parameters of active radar and radiometer systems used in observations of the earth's surface and meteorological objects from flight vehicles and satellites are presented. Methods for studying the active and passive radar methods used in cartography, geology, hydrology, oceanography, studies of vegetation cover, ice reconnaissance, and other geophysical fields are also discussed. J.F.

A81-47338 **Data collection and location by satellite - The Argos system.** J. L. Bessis (Centre Nationale d'Etudes Spatiales, Paris, France). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-80.* 18 p. 11 refs.

A description is given of the data collection and platform location functions of the Argos system, carried onboard NOAA meteorological satellites, whose environmental concerns include meteorology, oceanography, offshore phenomena, hydrology, biology, vulcanology, and seismology. The system comprises such user platforms as buoys, balloons, fixed or offshore stations, animals, etc., on-board equipment, a data processing center, and a data distribution system for Argos users. It is shown that platform results are available within hours after their acquisition by satellite, and are readily accessible by means of telephone or telex network from anywhere in the world. Flowcharts are presented for the management responsibilities of the various managing agencies, the user platform, the on-board data collection system, the data processing center, and software. O.C.

A81-47342 **Passive microwave systems.** E. Schanda (Bern, Universität, Berne, Switzerland). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-88.* 14 p. 20 refs.

Passive microwave sensors are presently applied on spaceborne platforms for investigations of large scale phenomena in geoscience and hydrology as well for the regular observation of meteorological features. Results of ground-based and airborne experiments over well-controlled test areas together with the present experience in synoptic earth observations from space can now be used for defining sensor systems for operational application in various fields of geoscience. Two examples are discussed: First the elements of a microwave payload for the global observation of the extent, the development and the hydrological state of the snow cover. Second, a payload for the measurement of the three-dimensional distribution of several minor constituents and of the temperature of the middle atmosphere by technique of limb sounding from Spacelab. A81-47345 **Program and instrumentation of the satellite experiment Bulgaria-1300 II.** D. Mishev, K. Serafimov (B'lgarska Akademiia na Naukite, Tsentralna Laboratoriia po Kosmicheski Izsledvaniia, Sofia, Bulgaria), Iu. Trifonov, and I. Vetlov (Academy of Sciences, Intercosmos Council, Moscow, USSR). *International Astronautical Federation, International Astronautical Congress, 32nd Rome, Italy, Sept. 6-12, 1981, Paper 81-91.* 6 p.

The Bulgaria-1300 II complex will study the relationship between various natural formations with reflected and emitted electromagnetic radiation in the visual, near infrared, and VHF range of the spectrum. The studies, which will be spaceborne, airborne, and ground-based, will give descriptions of natural formations and their state based on objective physical characteristics. The Bulgaria-1300 II spacecraft, which will be launched in solar synchronous orbit, incorporates a four-channel scanner of low selective capability (MSU-M), a two-channel scanner of average selective capability (MSU-S), four VHF radiometers in the centimeter range, and a 32-channel spectrometer system in the visible and near-infrared range. The complex will operate in various modes, including direct data transmission, onboard data recording and sequential transmission to earth. Basic instrumental parameters of the spectrometer SMP-32 and the radiometers RM1 - RM4 are given, and the MSU-M and MSU-S scanners are discussed in greater detail. J.F.

A81-47360 **Meteorological applications of the ARGOS system.** J. L. Bessis (Centre National d'Etudes Spatiales, Paris, France). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-121.* 15 p. 10 refs.

Attention is given to the way in which the ARGOS system can improve the meteorological network by using drifting buoys in connection with oceanographic data and balloons. Also discussed is the way in which moored meteorological buoys can be used to increase the forecasting period for weather analysis. C.R.

A81-47407 **New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300'.** K. Serafimov, I. Kutiev, S. Chapk'nov, M. Gogoshev, A. Bochev, Ts. Dachev, I. Ivanov (B'lgarska Akademiia na Naukite, Tsentralna Laboratoriia po Kosmicheski Izsledvaniia, Sofia, Bulgaria), V. Adasko, V. Balebanov, and A. Iosifian (Akademiia Nauk SSSR, Institut Kosmicheskikh Issledovanii, Moscow, USSR). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-212.* 10 p.

The instrumentation for the Intercosmos-Bulgaria-1300 program to study ionospheric and magnetospheric interactions is described. Scientific objectives and observations such as regularities in the appearance of localized regions of electric fields and excitation

mechanisms on stable auroral red arcs are discussed, and a table of measurement parameters and the respective instruments is given. Accuracies of 0.1% for the electric field and 0.002% for the magnetic field are expected. Fundamental space physics problems are covered, and the selection process of the most effective parameters for the satellite and its orbit is presented. Finally, the scientific payload, based on plasma, high-energy, electromagnetic and optical equipment systems is analyzed, including the Foton-1, which scans the UV spectrum between 110-260 nm, providing information for aeronomic studies and the identification of high-energy impact ionization processes.

A81-47409 **First results of the Intercosmos satellite IK-21.** K. Bischoff, E. Orlicek, K.-H. Schmelovsky, G. Zimmermann (Deutsche Akademie der Wissenschaften, Institut für Kosmosforschung, Berlin, East Germany), H.-J. Fischer (Gesellschaft für Weltraumforschung und Raumfahrt, East Germany), T. Hettenyi (Budapesti Muszaki Egyetem, Budapest, Hungary), G. Terekhin (Akademiia Nauk SSSR, Institut Kosmicheskikh Issledovanii, Moscow, USSR), and F. Wiegmann (Dresden, Technische Universität, Dresden, East Germany). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-214.* 14 p.

First results of technical tests on the data collection system for Intercosmos-21 are presented, including results from multispectral measurements in the visual and NIR ranges. The general communication and electronics structures are given, and optical details of instruments are shown. Maximum power consumption during transmission is 14 W, with a mean power consumption of 1.5 W. The satellite consists of two channel receivers at 400 MHz, a transmitter at 460 MHz, two transmitters at 136 MHz, two magnetic recorders and control electronics. Depending on the geographical distribution of platforms, the number of suitable contacts and total contact time can be limited, and a time window is introduced to avoid erroneous transmissions during near horizontal passages. Results of the tests confirm calculations based on laboratory measurements, with a preliminary error rate of .0001, which agrees well with calculations based on measured receiver sensitivity 0.1 microvolts at 60 ohms.

A81-48331 **A top-down approach to the use of simulation in computer system design.** I. C. Anderson (IBM Corp., Raleigh, NC), L. E. Deimel, Jr., R. J. Fornaro, and D. F. McAllister (North Carolina State University, Raleigh, NC). In: Summer Computer Simulation Conference, Seattle, WA, August 25-27, 1980, Proceedings. Arlington, VA, AFIPS Press, 1980, p. 89-93. 5 refs.

The process used in the design of the Edit Processor (EP) component of the Integrated Photogrammetric Instrument Network (IPIN) is described; IPIN is a network of instrumentation and minicomputers being assembled by the Defense Mapping Agency Aerospace Center to produce a data base of digitized terrain information from aerial stereophotographs. The top-down refinement of the EP simulation model proved to be an effective flexible tool to accompany the successive-refinement design process. The use of the multiple-server simplication for determining gross parameters of a system such as the EP is especially attractive and warrants further study to quantify the scope of its usefulness.

A81-48553 * **Advanced synthetic aperture radar for remote sensing.** K. Krishen, T. K. Sampsel (NASA, Johnson Space Center, Experiment Systems Div., Houston, TX), and W. E. Brown, Jr. (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: EASCON '80; Electronics and Aerospace Systems Conference, Arlington, VA, September 29-October 1, 1980, Conference Record. New York, Institute of Electrical and Electronics Engineers, 1980, p. 362-368. 5 refs.

A program initiated by NASA was formed to address some key earth resources synthetic aperture radar (SAR) needs. Major steps in the SAR system development are summarized, and the objective of the advanced SAR (ASAR) program is defined. The program rationale and specific objectives are discussed, including system calibration, wide-band technique evaluation, a system resolution of 10 m or better at 45 deg, and an airborne system to cover four bands within 1 to 10 GHz. The ASAR conceptual system design, consisting of a modulator, transmitter, antenna, receiver, calibrator, and data system modules is also presented, and ASAR capability expansions are discussed. The program, scheduled for 1983, will provide a data source which is not available to applications investigations at this time, and will produce design approaches that are flexible and multimission to the maximum extent for application to a Shuttle or a freeflyer system.

A81-48689 # **The characteristics of combining devices with different survey bands aboard a satellite (Osobennosti kompleksirovaniia na bortu ISZ priborov s razlichnymi polosami obzora).** A. A. Astashkin, V. K. Saul'skii, and G. R. Uspenskii. *Issledovanie Zemli iz Kosmosa,* July-Aug. 1981, p. 66-69. In Russian.

Several devices, having different resolutions and survey bands, are combined aboard satellites for the remote sensing of earth resources. A method is presented for calculating the satellite orbital parameters which will allow a complete coverage of the earth by each of the bands individually. Three devices are considered: a scanning television system with a survey band of 800 km and a resolution of 200 m, a multispectral system with a survey band of 200 km and a resolution of 50 m, and a television system with a survey band of 50-100 km and a resolution of 25 m. The requirements for the accurate maintenance of orbital height needed to accomplish a multi-band global survey are also determined.
J.F.

A81-48945 * **Early results from Magsat.** R. A. Langel (NASA, Goddard Space Flight Center, Geophysics Branch, Greenbelt, MD), R. H. Estes, and M. A. Mayhew (Business and Technological Systems, Inc., Seabrook, MD). *Nature,* vol. 293, Sept. 17, 1981, p. 190-192.

Papers presented at the May 27, 1981 meeting of the American Geophysical Union concerning early results from the Magsat satellite program, which was designed to study the near-earth magnetic fields originating in the core and lithosphere, are discussed. The satellite was launched on October 30, 1979 into a sun-synchronous (twilight) orbit, and re-entered the atmosphere on June 11, 1980. Instruments carried included a cesium vapor magnetometer to measure field magnitudes, a fluxgate magnetometer to measure field components and an optical system to measure fluxgate magnetometer orientation. Early results concerned spherical harmonic models, fields due to ionospheric and magnetospheric currents, the identification and interpretation of fields from lithospheric sources. The preliminary results confirm the possibility of separating the measured field into core, crustal and external components, and represent significant developments in analytical techniques in main-field modelling and the physics of the field sources.
A.L.W.

A81-49134 * **Satellite oceanography - The instruments.** R. H. Stewart (California Institute of Technology, Jet Propulsion Laboratory, Pasadena; California, University, Scripps Institution of Oceanography, La Jolla, CA). *Oceanus,* vol. 24, Fall 1981, p. 66-74. NASA-supported research.

It is pointed out that no instrument is sensitive to only one oceanographic variable; rather, each responds to a combination of atmospheric and oceanic phenomena. This complicates data interpretation and usually requires that a number of observations, each sensitive to somewhat different phenomena, be combined to provide unambiguous information. The distinction between active and passive instruments is described. A block diagram illustrating the steps necessary to convert data from satellite instruments into oceanographic information is included, as is a diagram illustrating the operation of a radio-frequency radiometer. Attention is also given to the satellites that carry the various oceanographic instruments. C.R.

A81-49753 # **The Surveillance Satellite Program and the future of microwave remote sensing.** A. L. Vankoughnett (National Research Council, Canada Centre for Space Science, Ottawa, Canada), R. K. Raney (Canada Centre for Remote Sensing, Ottawa, Canada), and E. J. Langham (Environment Canada, Inland Waters Directorate, Hull, Quebec, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 9-16. 8 refs.

The principal elements of the Canadian Surveillance Satellite (Sursat) program were participation in the NASA Seasat satellite experiment and a complementary research and development program. The Sursat program demonstrated the capabilities of spaceborne radiometers, scatterometers, and altimeters to monitor weath-

er and sea state parameters such as ocean surface temperature, ocean surface wind speed and direction, and ocean wave height. It also demonstrated the possibility of producing high-resolution images of the earth from space using Seasat SAR and the possibility that such images could provide information required by operational agencies for monitoring of ice coverage and drift. This paper describes the Sursat program and its conclusions and speculates about future microwave remote sensing activities in Canada.

A81-49765 # **The airborne SAR project - Conclusions and applications.** D. R. Inkster, R. T. Lowry, N. A. Prout (Intera Environmental Consultants, Ltd., Ottawa, Canada), R. K. Raney, and K. P. B. Thomson (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 119-126. 7 refs.

The extensive set of SAR imagery produced during the Airborne SAR Project (ASP) is examined along with some general research results. Maps of image areas are presented; data quality is examined; and the accessibility of the data to the public for future work is described. Results from the ice, oceans, lands, and human activities experiments are reviewed. Particular attention is given to ice surveillance research, including two recently completed industry-government pilot projects.
B.J.

A81-49801 # **Benefits of using airborne remote sensing for Thematic Mapping.** R. A. Ryerson (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 493-500. 5 refs.

Preliminary results of the benefit-cost analysis now being done on the CCRS Airborne Remote Sensing Program are presented. Using material verified by users, the analysis demonstrates that Airborne Remote Sensing (ARS) is often a cost effective and accurate source of data. What is more, ARS provides a permanent record which can be consulted for additional interpretation long after imaging. A comparison is made between 1:10,000 panchromatic and 1:60,000 CIR with respect to user/industry supplied acquisition costs, interpretation costs, number of images, and total cost of mapping a hypothetical area using new and archived CIR and panchromatic film. In every case, the CIR was found to cost less. Significant specific benefits are illustrated using examples of imagery, dollar benefits of the use of remote sensing are calculated, and nonquantifiable results are described.

GEOMAGNETIC FIELD MAPPING FROM A SATELLITE: SPATIAL POWER SPECTRA OF THE GEOMAGNETIC FIELD AT VARIOUS SATELLITE ALTITUDES RELATIVE TO NATURAL NOISE SOURCES AND INSTRUMENT NOISE

M. G. McLeod and P. J. Coleman, Jr. *In* Alabama Univ. UAH/NASA Workshop on the Use of a Tethered Satellite System May 1976 5-32 refs

(Publ-1810) Avail: NTIS HC A11/MF A01 CSCL 08G

The spectra for the field are presented together with power spectra of the natural magnetospheric and ionospheric noise and a power spectrum of instrumental noise for a typical fluxgate magnetometer. The source of these data is described. The implications of these data relative to desirable instrument frequency resonse, stability and resolution specification as well as the implications relative to desirable spacecraft position and orientation accuracy specifications and desirable environmental (temperature, magnetic noise) specifications are discussed. Implications of these power spectra relative to choice of a suitable magnetometer and relative to desirable methods of data processing are considered. Finally, implications for desirable orbit and mission duration are discussed.

THE SENSOR IMAGE SIMULATOR Interim Report, Oct. 1979 - May 1981
Marshall B. Faintich, Paul C. Figura, and E. W. Quinn (Goodyear Aerospace Corp., Akron, Ohio) 22 Jun. 1981 21 p refs Proposed for presentation at the 3rd Iterservice/Ind. Training Equipment Conf., Orlando, Fla., 30 Nov. - 2 Dec. 1981
(AD-A101172) Avail: NTIS HC A02/MF A01 CSCL 09/2

The primary objective of the digital sensor simulation investigations being conducted at the Defense Mapping Agency (DMA) is to establish an editing and analysis capability for the digital culture and terrain data bases. For purposes of quality control and data base applicability investigations, DMA has developed the Sensor Image Simulator (SIS), a very high speed data base edit station and static scene simulator that allows for interactive query and manipulation of individual features in the data base displays and/or simulated sensor scenes to determine the corresponding data base elements responsible for the simulated features. The SIS was installed at DMA in 1981, and is designed to play a key role in determining the applicability of prototype data bases for use in advanced training simulators, as well as to ensure the quality of, and coherence between, the various digital data bases prior to new data insertion into the master cartographic data base files.

RADAR ALTIMETER WAVEFORM MODELED PARAMETER RECOVERY
Aug. 1981 59 p refs
(NASA-TM-73294) Avail: NTIS HC A04/MF A01 CSCL 17I

Satellite-borne radar altimeters include waveform sampling gates providing point samples of the transmitted radar pulse after its scattering from the ocean's surface. Averages of the waveform sampler data can be fitted by varying parameters in a model mean return waveform. The theoretical waveform model used is described as well as a general iterative nonlinear least squares procedures used to obtain estimates of parameters characterizing the modeled waveform for SEASAT-1 data. The six waveform parameters recovered by the fitting procedure are: (1) amplitude; (2) time origin, or track point; (3) ocean surface rms roughness; (4) noise baseline; (5) ocean surface skewness; and (6) altitude or off-nadir angle. Additional practical processing considerations are addressed and FORTRAN source listing for subroutines used in the waveform fitting are included. While the description is for the Seasat-1 altimeter waveform data analysis, the work can easily be generalized and extended to other radar altimeter systems.

STUDY OF THE INFLUENCE OF THE ATMOSPHERE ON THE PERFORMANCE OF AN IMAGING MICROWAVE RADIOMETER

A. Guissard Paris ESA Jul. 1980 248 p refs
(Contract ESTEC-4124/79/NL-DG(SC))
(ESA-CR(P)-1421) Avail: NTIS HC A11/MF A01

Errors induced by the intervening atmosphere on the determination of ground parameters from a set of radiometers operating in two polarization states and in the frequency range from 5 to 90 GHz were analyzed. The precision with which the atmospheric parameters themselves are measurable was studied. Methods for estimating parameters from measurements performed in a noisy environment are discussed. The radiative transfer problem through a scattering medium is reviewed and an approximate scalar form of the radiative equation proposed, valid under the assumption that the depolarizing effect can be neglected. A complete model for the atmosphere is discussed, and analytical expressions for the attenuations from atmospheric gases, clouds and rain are given for the frequency range of interest. Models for the radiative behavior of sea and sea ice are discussed. Finally the performance of the multichannel radiometer is analyzed for several typical situations. Author (ESA)

APPLICATION OF NEW PRECISION MEASURING SYSTEMS FOR PHOTOGRAMMETRIC COMPARATORS Final Report
Reiner Schwebel Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 23 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-134; ISSN-0340-7608) Avail: NTIS HC A02/MF A01

A technique for high precision two-dimensional coordinates measurements was developed and led to the construction of a high precision comparator. The system is based on Abbe's comparator principle makes use of a precision metrological x-y grid and linear pulse generators, and is free of mechanical driving error. The maximum error of scale, coordinate system and interpolation unit is below 0.5 microns and the temperature dependence attains at most 0.5 microns per degree C. A computer interface permits such online applications as controlled aerotriangulation or multiple photogrammetry in astronomy and industry. Author (ESA)

INTRODUCTION TO THE WORKSHOP
A. Sieber *In* ESA Coherent and Incoherent Radar Scattering from Rough Surfaces and Vegetated Areas May 1981 p 13-17 refs
Avail: NTIS HC A08/MF A01

Research objectives in the use of scatterometers and imaging radar systems are discussed. System design for scatterometers and imaging radars, differences between scatterometers and imaging radars with respect to the measurement of scattered energy, and processing and evaluation of scatterometer data are included. Suggestions for work on theoretical models are given. These topics are related to data evaluation of synthetic aperture radar. Author (ESA)

A STUDY OF THE EFFECTS OF THE ATMOSPHERE ON THEMATIC MAPPER OBSERVATIONS
William A. Pearce, Principal Investigator 1 Oct. 1977 139 p refs ERTS
(Contract NAS5-23639)
(E81-10056; NASA-CR-166660; EGG-004-77) Avail: NTIS HC A07/MF A01 CSCL 08B

The impact of Rayleigh and aerosol light scattering and the scattering of light by the ground both within and beyond the instantaneous field of view of the sensor are included in a Monte Carlo computer code used to simulate the transport of radiation from its source (the Sun) to satellite-borne receivers. The problem of signature contamination by atmospheric scattering is addressed. The specifications of the details of the computer code and of the model for the atmosphere-Earth-receiver system are described. Specifications of the thematic mapper scheduled to be launched on LANDSAT-D are summarized. Model observations of ground patterns and calibration effects are discussed. General formalism, spread and modulation transfer functions, and image enhancement are considered. The impact of the atmosphere on classification and classification errors is examined. Recommendations are included. A.R.H.

09

GENERAL

Includes economic analysis.

A81-42231 **Environmental satellites.** E. P. McClain (NOAA, National Earth Satellite Service, Washington, DC). In: McGraw Hill encyclopedia of environmental science. New York, McGraw Hill Book Co., Inc., 1980. 16 p. 13 refs.

The meteorological and oceanographic applications of the Geostationary Operational Environmental Satellite (GOES) and Improved TIROS Operational Satellite (ITOS) are discussed. Brief descriptions of the satellites, including the solar activity monitors and data collection systems are given. Meteorological applications involve disaster warning, frost forecasting, search and rescue, and snow cover information. Oceanographic applications both in operations and research, include sea surface temperatures to aid oil tankers along the eastern seaboard, upwelling processes, ocean current systems, and ice mapping. Other spacecraft for meteorological and environmental studies launched by NASA are the Landsat 3, designed for high resolution, Nimbus 7, equipped with imagers and sounders, and Seasat 1, used for observations of the oceans. D.L.G.

A81-42287 # **Efficiency criteria of space systems for studying the earth's natural resources (Kriterii effektivnosti kosmicheskikh kompleksov dlia izucheniia prirodnykh resursov zemli).** V. S. Avduevskii, A. A. Astashkin, V. K. Saul'skii, and G. R. Uspenskii. *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 89-95. 11 refs. In Russian.

Criteria for evaluating the efficiency of space systems, used to study the earth's natural resources, are discussed. The procedure is based on the determination of additional user income gained from the application of the space system: costs of design, development, and operation; and values characterizing the ability of the system to complete the user tasks. The approach is illustrated by values projected for Landsat-D. J.F.

A81-42288 # **Main tasks and methods of operational planning of experiments concerning the observations of the earth from space (Osnovnye zadachi i metody operativnogo planirovaniia eksperimentov po issledovaniiu zemli iz kosmosa).** M. Iu. Beliaev. *Issledovanie Zemli iz Kosmosa,* May-June 1981, p. 96-101. 5 refs. In Russian.

The effective operational planning of geophysical experiments, involving the use of manned spacecrafts for the remote sensing of earth resources, is discussed. Operational planning is considered as one of the tasks of the overall control of a complex space system and can be reduced to several individual tasks. The proposed solution of the problems is performed in an interactive mode, and an algorithm for the operational planning of geophysical experiments is presented. J.F.

A81-42513 **Large scale human benefits of space industrialization.** C. L. Gould (Rockwell International Corp., Pittsburgh, PA). In: Update on space. Volume 1. Granada Hills, CA, National Behavior Systems, 1981, p. 30-63.

Space industrialization is defined as a new technology in which the special environmental properties of outer space are used for the social and economic benefit of the people of the earth. A study conducted in connection with a NASA Contract on Space Industrialization is discussed. Part One of this study identified the potential goals for space industrialization and looked at ways to realize those goals. Part Two was concerned with the programs and problems of actually bringing about the goals. Space can be used to provide very large scale benefits either supported by the government in public services, supported by private industry or some combination thereof. World problems related to the population explosion are considered and attractive opportunities gained from space are discussed. These opportunities can be divided into four categories, related to services, products, energy, and human activities. G.R.

A81-43535 **Skylab in retrospect.** E. E. Derenyi (New Brunswick, University, Fredericton, Canada). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Apr. 1981, p. 495-499. 7 refs.

Investigations conducted at the University of New Brunswick into the accuracy attainable for horizontal control extension using Skylab/EREP S-190A and S-190B imagery are reviewed. Single image and multiple image processing are discussed and it is shown that simple space resection procedures can give results compatible with more sophisticated aerial triangulation techniques. The RMSE values in X and Y coordinates ranged from 35 m to 75 m for S-190A photography and was on the order of 20 m photography for the S-190B imagery. The results obtained and the experience gained form a basis for predictions and recommendations pertinent to future space photography missions. In particular, the expected performance of the Large Format Camera, proposed for use in the Space Shuttle missions of the early 1980's, is discussed. (Author)

A81-43750 **Landsat technology transfer to the private and public sectors through community colleges and other locally available institutions.** R. H. Rogers, C. L. Wilson, R. H. Dye (Michigan, Environmental Research Institute, Ann Arbor, MI), and E. Jaworksi (Eastern Michigan University, Ypsilanti, MI). In: Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1981, p. PS-2-C-1 to PS-2-C-13. 5 refs.

NASA transferred Landsat technology to practicing professionals in the private sectors through community colleges and other locally available institutions. 'Hands on' interactive analysis training and demonstrations are offered through the use of color desk-top computer terminals communicating with a host computer by telephone lines. Features of the terminals and associated training materials are reviewed, including low cost, portability, interactive control, and special display features. Operational steps used to process Landsat data are enumerated. Plans for the of use of these features in training and demonstration projects are discussed. Results of the transfer project show that a gradual expansion of the user facility can be expected as confidence and available capital increase, and as the system shows potential for easily merging other sources of data into the Landsat analysis process. J.F.

A81-43981 # **Aerial thermal survey in the study of earth resources (Teplovaia aeros'emka pri izuchenii prirodnykh resursov).** B. V. Shilin. Leningrad, Gidrometeoizdat, 1980. 248 p. 119 refs. In Russian.

The principles of the thermal or infrared aerial surveying of earth resources are presented. Particular consideration is given to the operation of thermal sensors and to the selection of optimum survey conditions. Various applications of this technique are considered, including the study of anomalous temperature fields, geological mapping, the study of water bodies, the investigation of snow and ice cover, and hydrological and hydrogeological surveys. B.J.

A81-44635 **Commercial operations in space - 1980-2000; Proceedings of the Eighteenth Goddard Memorial Symposium, Washington, DC, March 27, 28, 1980.** Symposium sponsored by AAS, AIAA, AMA, et al. Edited by J. L. McLucas (Communications Satellite Corp., Washington, DC) and C. Sheffield (Earth Satellite Corp., Washington, DC). San Diego, CA, American Astronautical Society (Science and Technology Series. Volume 51); Univelt, Inc., 1981. 211 p. $30.

The need to revitalize American industry is considered along with questions of space industrialization, materials science and engineering in space, materials engineering in space, space power systems, earth resources, commercial launch operations, research opportunities, and international opportunities. Attention is given to the Space Shuttle power extension package, the orbital transfer of large space structures with nuclear electric rockets, a satellite power system overview of system studies and critical technology, electric orbit transfer vehicles, the mixed-mode principle and advanced chemical rocket engine concepts, crop reporting from space, the Space Industrialization Act and the government role in the commercialization of space, the airlines in the 80's and 90's, approaches to private sector involvement with government in technology development, innovation of space technology through joint endeavors between NASA and private industry, and the economic and political climate for exploitation of space riches. G.R.

A81-46234 # **European industrial space projects.** G. C. Bernardini (Italeco S.p.A., Rome, Italy). *American Astronautical Society, Goddard Memorial Symposium on International Space Technical Applications, 19th, Arlington, VA, Mar. 26, 27, 1981, Paper 81-053.* 8 p.

The efforts of an Italian civil engineering firm (ITALECO S.p.A.) to profitably use Landsat data are recounted. The data did not bring the commercial benefits hoped for, primarily because of the absence of repeatable and reliable rules for converting the esoteric art of Landsat interpretation into science and engineering practice. At present, the only role for Landsat, from a commercial viewpoint, is that of a source with which to supplement the information available from standard methods. C.R.

A81-46238 # **Development of Marine Observation Satellite-1.** K. Matsumoto (National Space Development Agency of Japan, Earth Observation Systems Dept., Tokyo, Japan). *American Astronautical Society, Goddard Memorial Symposium on International Space Technical Applications, 19th, Arlington, VA, Mar. 26, 27, 1981, Paper 81-060.* 9 p.

The program of MOS-1, the first Japanese earth observation satellite system to be developed for experimental purposes, is outlined. The mission objectives are to establish fundamental technologies common to both marine and land observation satellites, observe the sea surface and atmosphere using visible, infrared, and microwave radiometers, and verify the performance of these sensors. A table giving the characteristics of the MOS-1 sensors is included, and the data collection system transponder is described. Also included is a schematic diagram of the MOS-1 communication system. The various systems making up the ground segment are also described. C.R.

A81-47346 **SPOT status of development.** M. Courtois (Centre National d'Etudes Spatiales, Toulouse, France). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Se, 6-12, 1981, Paper 81-92.* 11 p.

The System Probatoire d'Observation de la Terre (SPOT), a general purpose remote sensing satellite system, will be launched in May, 1984 within the French National Space Program. The SPOT mission objectives include the compilation of a worldwide data base for cartographic and earth resource exploration purposes, improvements in vegetative species discrimination, and the evaluation of photointerpretation methods and the linear array camera in space. The SPOT satellite consists of the SPOT 'bus', a standard multipurpose platform, and the payload; it will weigh 1750 kg at the start of the mission and operate in a circular sun-synchronous near-polar orbit at an altitude of 832 km. The HRV (high resolution visual) instrument is designed to operate in either a panchromatic mode (broad spectral band) with a ground sampling mesh of 10 m x 10 m or a multispectral mode (three narrower color bands) with a ground sampling mesh of 20 m x 20 m. This flexibility will enable the specific target scenes to be sampled more frequently as well as provide for stereo coverage of important areas. Linear arrays of CCD detectors will combine a high data rate (25 m bits/sec/data channel) with good radiometric resolution. Data from the satellite will be accessible through the central facility in France or through authorized X-band direct read-out stations. J.F.

A81-47350 **Physical and technical foundations for the development of subsatellite systems for the exploration of natural earth resources.** T. K. Ismailov (Akademiia Nauk Azerbaidzhanskoi SSR, Institut Kosmicheskikn Issledovanii Prirodnykh Resursov, Baku, Azerbaidzhan SSR). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-101.* 10 p. 5 refs.

The importance of organizing a subsatellite environmental service is stressed. The principal objective of this service would be the prompt and regular collection, processing, and transmission of the results obtained from both contact and remote measurements of a large number of physicochemical, biometric, optical, and geometric characteristics of natural objects. The measurements would be taken at specified control points on the earth's surface using observation and measurement platforms (air, continental, and marine) either synchronously or quasi-synchronously with space facilities. C.R.

A81-47355 **Soviet remote sensing of the earth's resources and interpretation of space data with reference to the Caspian Sea, Siberia and the Arctic Ocean.** J. Popescu (British Broadcasting Corp., Monitoring Service, Reading, Berks., England). *International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept. 6-12, 1981, Paper 81-112.* 8 p. 11 refs.

Soviet remote sensing of the earth's resources, including population, by unmanned and manned satellites is discussed. Multiscanning equipment is described, and it is noted that photographs and remote sensing data are used for making maps, prospecting, research, farming, civil engineering, weather forecasting, and protecting the environment. Attention is given to the increased importance of the data transmitted by crews on board the Salyut-6 space lab. C.R.

A81-47826 **What does space remote sensing provide (Qu'apporte la télédétection spatiale).** P. Gonfreville (Centre National d'Etudes Spatiales, Paris, France). *L'Aéronautique et l'Astronautique,* no. 89, 1981, p. 3-20. In French.

The capabilities and advantages of space remote sensing in the gathering of data for the management of natural resources and national development are discussed. The principles and operational characteristics of space remote sensing are considered with particular reference to the Landsat and SPOT systems. Attention is then given to specific applications of space remote sensing in the fields of cartography, including topographic and thematic mapping, agriculture, including national agricultural statistics, crop prediction and agricultural management, forests and natural vegetation, inland water resources, regional management for economic and social development, mineral and petroleum exploration, oceanography and other types of large inventories. A.L.W.

A81-47829 **Evaluation of the 1980 Cosmos program (Bilan du programme Cosmos 1980).** D. Laurent. *L'Aéronautique et l'Astronautique,* no. 89, 1981, p. 44-50. In French.

In the year 1980, the Soviet Union effected 89 rocket launches sending into orbit 110 satellites. The present paper examines the 88 of these satellites not launched as part of specific space programs but within the framework of the diversified Cosmos program. Of the 78 satellites launched for military applications, 30 were for purposes of photographic reconnaissance, 25 were for telecommunications, seven for navigation, five for electronic surveillance, five for early warning, three for ocean surveillance and three for interception. Six satellites for civilian applications were launched: four for purposes of earth resource detection and two Molniya satellites unable to be placed in their desired orbits. Four Cosmos satellites were sent up with scientific missions, including ocean observations, and geophysical experiments. As to general trends over the last five years, 1980 witnessed an increase in space activities compared to the previous year, continuing emphasis on the military sector and a preference for orbital inclinations of 72.9 and 82.3 deg. A.L.W.

A81-48527 **Requirements on the data/information system.** R. Bernstein (IBM Scientific Center, Palo Alto, CA). In: EASCON '80; Electronics and Aerospace Systems Conference, Arlington, VA, September 29-October 1, 1980, Conference Record.

New York, Institute of Electrical and Electronics Engineers, 1980, p. 20-26. 6 refs.

The paper examines current problems concerning the development and implementation of satellite systems of earth observation, and suggests some approaches and solutions for the future that involve software, system, and data standardization, and the development of a global digital data base. Advanced sensors produce digital data at rates of tens of millions of bits per second; communication systems exist that are capable of disseminating the data on a worldwide basis at millions of bits per second; and ground processing systems are currently operational that are preprocessing the sensor data and making them available to the user community. It is likely that future problems will involve managing the acquisition and distribution of these data, and providing the data to the users in a timely manner, in a suitable form, and at the lowest possible cost. B.J.

A81-48549 **The SPOT satellite mission, applications aspects and data products.** J.-P. Fouquet (Ambassade de France aux Etats Unis, Washington, DC). In: EASCON '80; Electronics and

Aerospace Systems Conference, Arlington, VA, September 29-October 1, 1980, Conference Record. New York, Institute of Electrical and Electronics Engineers, 1980, p. 306, 307.

A brief description of the SPOT satellite system is given. It is pointed out that the first mission's (1984) payload will comprise two identical optical instruments, which are described in detail, two onboard recorders, and an image telemetry system at 8 GHz (X-band). The SPOT system will be used mainly in cartography, geology, and agriculture. With regard to cartography, it is noted that the telescopes, because they can be pointed, will provide the cartographic user with a capability for quasi-vertical coverage and slant or stereo coverage. In geology, stereo data will be very useful in the reconnaissance exploration for the study of geomorphic features. In agriculture, the system's ground resolution will enable agricultural users to control small fields or to use SPOT data as samples for Landsat D data with which compatibility is studied. Tables giving the characteristics of the system's first payload and standard SPOT products are included. C.R.

A81-48936 **Remote sensing in development.** C. K. Paul (U.S. Agency for International Development, Washington, DC) and A. C. Mascarenhas (Dar es Salaam, University, Dar es Salaam, Tanzania). *Science*, vol. 214, Oct. 9, 1981, p. 139-145. 12 refs.

It is pointed out that in developing countries remote sensing is used to acquire statistics on crops and to locate petroleum and mineral deposits. To an ever greater extent, it is also being used for forest monitoring and subsurface water location. Among the problems related to Third World use of the technology are sensitivity about the dissemination of data with high spatial resolution, exploitation by multinational companies, absorptive capacity of countries for advanced technology, autonomy in acquiring resource information, and competing foreign policy interest of the industrialized world in the global search for raw materials. The attitude of Third World countries toward the use of remote sensing is seen as depending on the development model they adopt. C.R.

A81-49468 # **International monitoring from space /Problems of international law/ (Mezhdunarodnyi kontrol' s ispol'zovaniem kosmicheskikh sredstv /Mezhdunarodno-pravovye problemy/).** I. I. Kotliarov. Moscow, Izdatel'stvo Mezhdunarodnye Otnosheniia, 1981. 120 p. 232 refs. In Russian.

The work considers various aspects of monitoring and surveillance with regard to international laws and agreements on environment protection, disarmament, the use of space, etc. The use of spacecraft for purposes of such monitoring is discussed in detail. B.J.

A81-49751 **Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings.** Symposium sponsored by CASI, Canada Centre for Remote Sensing, Environment Canada, et al. Edited by T. T. Alfoldi (Canada Centre for Remote Sensing, Ottawa, Canada). Ottawa, Canadian Aeronautics and Space Institute, 1981. 715 p. In English and French.

Aspects of remote sensing technology and operational experience are reviewed, with reference to Canadian Programs. Particular attention is given to such applications as land use, forestry, agriculture, geology, hydrology, and pollution monitoring. A special section is devoted to radar (particularly SAR) applications and technology. B.J.

A81-49762 # **The remote sensing satellite program of the European Space Agency (Le programme de satellites de télédétection de L'Agence Spatiale Européenne).** D. Breton (ESA, Earth Observation Programme Office, Toulouse, France). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 89-96. In French.

The main directions of ESA activities in remote sensing are: the Earthnet program; remote sensing activities that will be implemented during the first Spacelab mission; and project definition, system studies of instruments, and technological activities relating to the ESA remote sensing satellite program. This paper examines the ESA remote sensing satellite program; attention is given to the objectives of the program, the Canadian Sursat requirements, the results of past studies, and ongoing or projected activities. B.J.

A81-49763 # **Present state of remote sensing development in Poland.** J. Konieczny and A. Linsenbarth (Instytut Geodezji i Kartografii, Warsaw, Poland). In: Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1981, p. 97-101.

A brief description is presented of the development of remote sensing in Poland as well as of the main aims and achievements of the Polish Center for Remote Sensing (OPOLIS). The instrumentation system of OPOLIS is reviewed, and various applications of remote sensing in Poland are examined, including land use mapping, agriculture, forest surveys, water pollution studies, air pollution studies, disaster surveying, and geological surveys. B.J.

N81-31030# Committee on Science and Technology (U S House).

NASA AUTHORIZATION, 1982, VOLUME 4

Washington GPO 1981 1248 p Hearings before the Subcomm on Space Sci and Appl of the Comm on Sci. and Technol., 97th Congr., 1st Sess., No 7, 28 Jan., 20, 23, 27 Feb., and 2, 4-5, 10-11 Mar. 1981

(GPO-79-432-Vol-4) Avail: Subcommittee on Space Science and Applications

Progress and accomplishments of the year are reviewed and requests for funding are examined in the areas of space sciences, shuttle related activities, space flight operations, a space applications, and aeronautics. The numerical aerodynamics simulation which will reduce the cost of aircraft design, chemical propulsion, large space structures, power systems, information systems, and the Venus Orbiting Imaging Radar spacecraft are discussed. Space processing, Spacelab payloads, and possible space shuttle configurations are also examined. A.R.H.

SPACE BENEFITS: THE SECONDARY APPLICATION OF AEROSPACE TECHNOLOGY IN OTHER SECTORS OF THE ECONOMY

[1981] 240 p refs

(Contract NASw-3113)

(NASA-CR-164733) Avail: NTIS HC A11/MF A01 CSCL 05A

Some 585 examples of the beneficial use of NASA aerospace technology by public and private organizations are described to demonstrate the effects of mission-oriented programs on technological progress in the United States. General observations regarding technology transfer activity are presented. Benefit cases are listed in 20 categories along with pertinent information such as communication link with NASA; the DRI transfer example file number, and individual case numbers associated with the technology and examples used; and the date of the latest contract with user organizations. Subject, organization, geographic, and field center indexes are included. A.R.H.

FIELD STUDY FOR REMOTE SENSING: AN INSTRUCTOR'S MANUAL

William H. Wake, ed. (California State Coll., Bakersfield) and Garth A. Hull, ed. 1981 93 p refs Proceedings of the LANDSAT C Educator's/User's Workshop, Santa Maria, Calif., 2-4 Mar. 1978; sponsored by the National Council for Geographic Education and Univ. of Western Illinois, Macomb

(NASA-CP-2155; A-8336; LC-78-61696) Avail: NTIS HC A05/MF A01 CSCL 05I

The need for and value of field work (surface truthing) in the verification of image identification from high atitude infrared and multispectral space sensor images are discussed in this handbook which presents guidelines for developing instructional and research procedures in remote sensing of the environment.

N81-32565*# International Business Machines Corp., White Plains, N.Y. General Business Group.

AN INDUSTRIAL PERSPECTIVE OF THE LANDSAT OPPORTUNITY

Barbara F. Williams *In* NASA. Ames Research Center Field Study for Remote Sensing 1981 p 1-3

Avail: NTIS HC A05/MF A01 CSCL 05B

The feasibility of enhancing LANDSAT products to provide the greatest usability low cost data possible can be determined through government sponsorship and finance of one or more task forces composed of a critical number of experts in multiple disciplines from many industries and academia. The synergism of multiple minds addressing singular problems without the creation of permanent or perpetual structures must yield output in the form of implementable specifications, even if presented as alternatives. Changes are needed within the spacecraft in order to account for Sun angle changes. The use of pointing accuracy to make geometric corrections (and possible radiometric corrections, is needed more than onboard data reduction and information extraction, which assume a proper knowledge of application and reduce potential utilization. Multilinear arrays need to be investigated and methods for sensor calibration and for determining the effects of atmospheric inversion, as well as the best way to back out the modulation transfer function must be determined. A.R.H.

N81-32566*# California State Coll., Bakersfield. Dept. of Physics and Earth Sciences.

THE WORKSHOP

William H. Wake *In* NASA. Ames Research Center Field Study for Remote Sensing 1981 p 5-7

Avail: NTIS HC A05/MF A01 CSCL 05B

The plan is presented for a two day workshop held to provide educational and training experience in the reading, interpretation, and application of LANDSAT and correlated larger scale imagery, digital printout maps, and other collateral material for a large number of participants with widely diverse levels of expertise, backgrounds, and occupations in government, industry, and education. The need for using surface truth field studies with correlated aerial imagery in solving real world problems was demonstrated. A.R.H.

N81-32567*# California State Coll., Bakersfield. Dept. of Physics and Earth Science.

WHY SURFACE-TRUTH FIELD STUDY IS NEEDED IN REMOTE-SENSING INSTRUCTION

William H. Wake *In* NASA. Ames Research Center Field Study for Remote Sensing 1981 p 9-15 ref

Avail: NTIS HC A05/MF A01 CSCL 05I

Especially designed field studies are needed in remote sensing technology transfer courses regardless of the field work provided by the students'/trainees' major disciplines because the remote sensing discipline has unique emphases and needs. Modification of existng schedules to include field work provides the equivalent of extending the duration of the program with the added benefit of enhancing learning achievements per actual program day. The process of surface truth field instruction, levels of student capabilities and stages in the development of surface truth field studies are discussed. A.R.H.

N81-32571*# Sonoma State Univ., Calif. Dept. of Geography.

LANDSAT C WORKSHOP FIELD/LABORATORY EXERCISES

Joseph W. Frasca *In* NASA. Ames Research Center Field Study for Remote Sensing 1981 p 45-59 refs

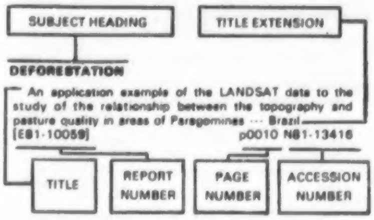
Avail: NTIS HC A05/MF A01 CSCL 05I

Collection of ground information and supportive materials are absolutely necessary to verify and substantiate data extracted by the interpretation process regardless of sensor type and scale. Field observation and notes, the use of topographic and thematic maps, crop calendars, and climate records are just four examples of supportive materials which often are used in conjunction with remotely sensed materials. Illustration of this integrated multisensor approach is provided by four examples from the March, 1978 Santa Maria LANDSAT C Conference and Workshop. Four distinctive window sites were selected to demonstrate the usefulness of remotely sensed materials to solve geographic problems. A.R.H.

SUBJECT INDEX

Earth Resources/*A Continuing Bibliography (Issue 32)* JANUARY 1982

Typical Subject Index Listing



SUBJECT HEADING
TITLE EXTENSION
DEFORESTATION
An application example of the LANDSAT data to the study of the relationship between the topography and pasture quality in areas of Paragominas --- Brazil
[E81-10059] p0010 N81-13416
TITLE
REPORT NUMBER
PAGE NUMBER
ACCESSION NUMBER

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section (of this supplement). If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

NASA authorization, 1982, volume 4 [GPO-79-432-VOL-4] p0279 N81-31030

AEROSPACE TECHNOLOGY TRANSFER

Landsat technology transfer to the private and public sectors through community colleges and other locally available institutions p0277 A81-43750

Space Benefits: The secondary application of aerospace technology in other sectors of the economy [NASA-CR-164733] p0279 N81-32086

AFRICA

Hydrogeologic interpretations of Landsat imagery in arid zones of South and West Africa p0248 A81-43229

Ground water exploration programs in Africa p0226 A81-43230

AGRICULTURE

Agricultures's needs related to satellite hydrology p0197 A81-43181

An application of Landsat and computer technology to potential water pollution from soil erosion p0250 A81-43253

Interpretation techniques applied to mixed terrains p0218 A81-49788

A simulation of Thematic Mapper performance in an agricultural application p0204 A81-49810

Use of satellite pictures for agriculture p0205 N81-28120

Agricultural water demand prediction using remote sensing technology for Georgia resource management [PB81-184137] p0207 N81-30508

AgRISTARS (Agriculture And Resources Inventory Surveys Through Aerospace Remote Sensing) DC/LC (Domestic Crops and Land Rover) project summary crop area estimates for Kansas and Iowa, 1980 [PB81-196909] p0207 N81-30511

Meteorological satellite data: A tool to describe the health of the world's agriculture [E81-10204] p0207 N81-31596

Crop area estimates using ground-gathered and LANDSAT data: A multitemporal approach: Missouri, 1979 [PB81-186751] p0208 N81-31614

AGRISTARS PROJECT

Users manual for the US baseline corn and soybean segment classification procedure [E81-10190] p0206 N81-29504

AgRISTARS (Agriculture And Resources Inventory Surveys Through Aerospace Remote Sensing) DC/LC (Domestic Crops and Land Rover) project summary crop area estimates for Kansas and Iowa, 1980 [PB81-196909] p0207 N81-30511

AgRISTARS: Foreign commodity production forecasting. Program review presentation to level 1, Interagency Coordination Committee [E81-10168] p0209 N81-33555

AGROCLIMATOLOGY

Weather analysis and interpretation procedures developed for the US/Canada wheat and barley exploratory experiment [E81-10208] p0207 N81-31599

AGROMETEOROLOGY

Use of satellite pictures for agriculture p0205 N81-28120

Yield Model Development (YMD) implementation plan for fiscal years 1981 and 1982 [E81-10211] p0208 N81-32577

AIR POLLUTION

Measurements of CF2Cl2, CFCl3, and N2O in the lower stratosphere between 2 deg S and 73 deg N latitude p0214 A81-44515

Aerosol formation, transformation, and effects in Denver's emissions plume p0214 A81-44526

An atmospheric study by 'Spectrum-15' onboard of the Salyut-6 orbital station [IAF PAPER 81-120] p0216 A81-47359

The distribution of the trace gases H2O, NO2, and HNO3 in the middle atmosphere on the basis of LIMS measurements --- Limb Infrared Monitor of Stratosphere p0217 A81-49407

Aerosol sounding by means of aircraft-borne optical radar p0217 A81-49431

Comparative measurements of stratospheric CH4 and CO concentrations with spectrograph and correlation radiometers p0217 A81-49433

Atmospheric nitric acid and chlorofluoromethane 11 from interferometric spectra obtained at the Observatoire du Pic du Midi [AERONOMICA-ACTA-A-227-1980] p0219 N81-30656

Environmental measurements of power plant cooling tower and stack plumes [DOE/EV-02463/6] p0219 N81-30695

NASA participation in the 1980 Persistent Elevated Pollution Episode/Northeast Regional Oxidant Study (PEPE/NROS) Project: Operational aspects [NASA-TM-83170] p0220 N81-32708

AIR WATER INTERACTIONS

A comparison of Seasat 1 altimeter measurements of wave height with measurements made by a pitch-roll buoy p0231 A81-42066

Satellite detection of seiches in Great Salt Lake, Utah p0243 A81-42126

A note on indirect detection of seiches in Great Salt Lake, Utah, by NOAA and Landsat satellite imagery p0247 A81-43218

The structure of short gravity waves on the ocean surface p0234 A81-46105

The wind speed dependency of ocean microwave backscatter p0234 A81-46109

The study of mesoscale ocean winds p0235 A81-46110

Spatial evolution of ocean wave spectra p0235 A81-46112

Satellite-tracked drift buoy observations of the near-surface flow in the eastern mid-latitude North Pacific p0236 A81-47022

The future for satellite-derived surface winds p0237 A81-49129

Climate, the oceans, and remote sensing p0237 A81-49132

Airborne estimation of water quality parameters in Lake Ontario p0254 A81-49796

Following oceanographic phenomena on the South Coast of Brazil with remote sensing from orbital distance [INPE-1975-RPE/280] p0240 N81-30498

Sea surface scattering p0241 N81-33344

AIRBORNE EQUIPMENT

Use of ocean color scanner data in water quality mapping p0251 A81-43545

Radar methods for studying the earth --- Russian book p0273 A81-46924

Aerosol sounding by means of aircraft-borne optical radar p0217 A81-49431

The airborne SAR project: Conclusions and applications p0275 A81-49765

AIRBORNE/SPACEBORNE COMPUTERS

An evaluation of detail in dynamic visual displays [AD-A103378] p0222 N81-33578

ALASKA

Sea ice detection using enhanced infrared satellite data p0232 A81-42131

Potentials of mapping buried glacier ice with Landsat thermal imagery p0246 A81-43204

Environmental assessment of the Alaskan continental shelf: Reports of principal investigators. Volume 1: Receptors - birds, plankton, littoral, benthos [PB81-196263] p0240 N81-30780

Terrain profiling from Seasat altimetry [NASA-CR-156878] p0222 N81-31604

ALBEDO

Correlation between integral and spectral albedos of clouds over water surfaces p0235 A81-47004

Theoretical investigations concerning the measurement of the plankton concentration with the aid of satellites p0237 A81-49426

ALGAE

A remote sensing technique to monitor Cladophora in the Great Lakes [PB81-173841] p0254 N81-29520

ALLUVIUM

An examination of fluvial morphological characteristics of western Amazon streams from Apollo-Soyuz photographs p0247 A81-43212

Applications of Landsat imagery to a coastal inlet stability study p0250 A81-43249

ALTIMETERS

Calibration validation for the GEOS 3 altimeter p0270 A81-42871

The promise of satellite altimetry --- for oceanography p0237 A81-49128

AMAZON REGION (SOUTH AMERICA)

An examination of fluvial morphological characteristics of western Amazon streams from Apollo-Soyuz photographs p0247 A81-43212

ANGULAR CORRELATION

Angular anisotropy of reflection from various types of underlying surface. I - Snow cover. II - Desert p0260 A81-47007

ANGULAR DISTRIBUTION

The effect of angular distribution models on the estimation of the earth's albedo p0269 A81-41915

ANNUAL VARIATIONS

Annual and interannual variations in outgoing longwave radiation over the tropics p0251 A81-43356

ANTARCTIC REGIONS

Satellite Image Atlas of the earth's glaciers p0246 A81-43202

Ice sheet altimetry
[NASA-CR-156877] p0240 N81-31605
Ocean services for the nation. National ocean goals and objectives for the 1980's
[PB81-200602] p0240 N81-31808
Investigation of Antarctic crust and upper mantle using Magsat and other geophysical data
[E81-10113] p0222 N81-32574
Possible applications of communication satellites for research tasks in polar regions
[BMFT-FB-W-80-029] p0267 N81-33587

ANTICLINES
The use of imagery of the earth to study the structure of degassing zones within oil and gas basins
p0225 A81-42276

APPROPRIATIONS
NASA authorization, 1982, volume 4
[GPO-79-432-VOL-4] p0279 N81-31030

AQUIFERS
Landsat data for locating shallow glacial aquifers in eastern South Dakota p0226 A81-43228
Applications of aerospace data for detection of submarine springs in Jamaica p0226 A81-43232
Mapping irrigated cropland on the High Plains using Landsat p0198 A81-43266

ARCHAEOLOGY
Use of imaging radar for geology and archeology
p0226 A81-43730

ARCTIC OCEAN
Soviet remote sensing of the earth's resources and interpretation of space data with reference to the Caspian Sea, Siberia and the Arctic Ocean
[IAF PAPER 81-112] p0278 A81-47355
Single and multiple parameter microwave signatures of sea ice p0238 A81-49774
Radar detection of sea-ice ridges and icebergs in frozen oceans at incidence angles from 0 deg to 90 deg
p0238 A81-49775
Environmental assessment of the Alaskan continental shelf: Reports of principal investigators. Volume 1: Reactors - birds, plankton, littoral, benthos
[PB81-196263] p0240 N81-30780
Ocean services for the nation. National ocean goals and objectives for the 1980's
[PB81-200602] p0240 N81-31808

ARCTIC REGIONS
Roles of satellites in hydrology p0245 A81-43199
The use of satellite imagery as an aid to the Canadian Coast Guard ice operations p0238 A81-49758

ARID LANDS
Hydrogeologic interpretations of Landsat imagery in arid zones of South and West Africa p0248 A81-43229
Remote methods and desert conservation --- Russian book p0213 A81-43523
A comparison between two photographic methods for the determination of relative bidirectional reflectance
p0259 A81-45431
A case study of soil erosion detection by digital analysis of the remotely sensed multispectral Landsat scanner data of a semi-arid land in southern India p0201 A81-46050
The environmental vegetation index: A tool potentially useful for arid land management --- Texas and Mexico, plant growth stress due to water deficits
[E81-10191] p0206 N81-29505
Identifying igneous rocks in an arid environment on aerial photography by photo tone and photo texture
[AD-A102809] p0228 N81-32587

ARIZONA
Prediction of water yield using satellite imagery and a snowmelt simulation model p0246 A81-43205
Correlation of geologic structure inferred from computer enhanced Landsat imagery with underground water supplies in Arizona p0225 A81-43227
A radar image time series p0226 A81-45430
Use of Landsat digital data to assist in mapping soils on Arizona rangelands p0201 A81-46047
Remote sensing and land use planning
p0218 A81-49792
Role of aerial photographs in classification of Landsat data p0262 A81-49808
Spectral properties of Arizona soils and rangelands and their relationship to LANDSAT digital data
p0207 N81-31595
Terrain profiling from Seasat altimetry
[NASA-CR-156878] p0222 N81-31604

ARRID LANDS
Landform-vegetation relationships in the northern Chihuahuan Desert
[AD-A102896] p0208 N81-32588

ASIA
The use of imagery of the earth to study the structure of degassing zones within oil and gas basins
p0225 A81-42276
Concerning the hydrogeological significance of faults on platform regions, as revealed by space imagery
p0225 A81-42277
Ring structures of Precambrian shields, based on the interpretation of space imagery p0225 A81-42278
Space research on seismic regions p0225 A81-42280

ATLANTIC OCEAN
Hurricane 'Flossie' /September 1978/ observed in the north Atlantic, by the Meteosat satellite
p0213 A81-41061
Microwave radiometer measurement of tidally induced salinity changes off the Georgia coast p0232 A81-42067
Remote sensing of coastal pollutants using multispectral data p0233 A81-43245
Aerospace remote sensing of the coastal zone for water quality and biotic productivity applications
p0233 A81-43246
Combined satellite imagery for study of coastal circulation, Onslow Bay, North Carolina
p0233 A81-43250
Satellite determination of the mesoscale variability of the sea surface temperature p0234 A81-44861
The study of mesoscale ocean winds
p0235 A81-46110
Tracking of a warm water ring p0235 A81-46117
Radiation studies in the atmosphere
p0216 A81-47001
Atlantic hurricane season of 1980 p0238 A81-49649
Meteosat experience in assisting commercial fishing
p0239 A81-49807
Following oceanographic phenomena on the South Coast of Brazil with remote sensing from orbital distance
[INPE-1975-RPE/280] p0240 N81-30498
Interpretation of hydrographic features seen in the waters off Cape Cod
[AD-A102343] p0240 N81-31803

ATMOSPHERIC ATTENUATION
Atmospheric correction of Nimbus-7 Coastal Zone Color Scanner imagery p0271 A81-45879
Study of the influence of the atmosphere on the performance of an imaging microwave radiometer
[ESA-CR(P)-1421] p0275 N81-30342

ATMOSPHERIC CHEMISTRY
Basic problems of the physics and chemistry of contemporary changes of climate p0216 A81-47002

ATMOSPHERIC COMPOSITION
Passive microwave techniques for geophysical sensing of the earth from satellites p0270 A81-43071
Measurements of CF2Cl2, CFCl3, and N2O in the lower stratosphere between 2 deg S and 73 deg N latitude
p0214 A81-44515
Aerosol formation, transformation, and effects in Denver's emissions plume p0214 A81-44526
A differential inversion method for high resolution atmospheric remote sensing p0215 A81-45862
The distribution of the trace gases H2O, NO2, and HNO3 in the middle atmosphere on the basis of LIMS measurements --- Limb Infrared Monitor of Stratosphere
p0217 A81-49407
Comparative measurements of stratospheric CH4 and CO concentrations with spectrograph and correlation radiometers p0217 A81-49433

ATMOSPHERIC MOISTURE
Determination of moisture from NOAA polar orbiting satellite sounding radiances p0243 A81-41158
Modeling the terrestrial hydrology for the global atmosphere - The future role of satellite data
p0245 A81-43197

ATMOSPHERIC OPTICS
Investigation of the efficiency of the optical sounding of aerosol by the use of spectral photometers
p0215 A81-45406
Radiation studies in the atmosphere
p0216 A81-47001
Correlation between integral and spectral albedos of clouds over water surfaces p0235 A81-47004
An atmospheric study by 'Spectrum-15' onboard of the Salyut-6 orbital station
[IAF PAPER 81-120] p0216 A81-47359
Methods of editing cloud and atmospheric layer affected pixels from satellite data --- in south Texas test area
[E81-10169] p0266 N81-33556

ATMOSPHERIC PHYSICS
Radiation studies in the atmosphere
p0216 A81-47001
Basic problems of the physics and chemistry of contemporary changes of climate p0216 A81-47002

ATMOSPHERIC RADIATION
A radiometric model of an earth radiation budget radiometer optical system with diffuse-specular surfaces
p0269 A81-41919
Radiation studies in the atmosphere
p0216 A81-47001

ATMOSPHERIC REFRACTION
A 'meteorological' method for calculating vertical refraction p0221 A81-48679

ATMOSPHERIC SCATTERING
Role of multiple scattering in ozone profile retrieval from satellite measurements in the ultraviolet
p0215 A81-45870
Fourier modulus image construction
[AD-A101728] p0264 N81-30723
A study of the effects of the atmosphere on thematic mapper observations
[E81-10056] p0276 N81-33540
Cornell University Remote Sensing Program
[E81-10174] p0255 N81-33560

ATMOSPHERIC SOUNDING
Determination of moisture from NOAA polar orbiting satellite sounding radiances p0243 A81-41158
A new numerical treatment of the source function in the radiative transfer equation --- for vertical atmospheric temperature and humidity profile retrieval from satellite radiance measurements p0269 A81-41916
Remote sensing of atmospheres and oceans; Proceedings of the Interactive Workshop on Interpretation of Remotely Sensed Data, Williamsburg, VA, May 23-25, 1979
p0234 A81-45861
A differential inversion method for high resolution atmospheric remote sensing p0215 A81-45862
Inversion of multiwavelength radiometer measurements by three-dimensional filtering p0271 A81-45873
Remote sounding of atmosphere and ocean for climate research /Appleton Lecture/ p0236 A81-47099
Passive microwave systems
[IAF PAPER 81-88] p0273 A81-47342
Aerosol sounding by means of aircraft-borne optical radar p0217 A81-49431

ATMOSPHERIC TEMPERATURE
Passive microwave techniques for geophysical sensing of the earth from satellites p0270 A81-43071
A 'meteorological' method for calculating vertical refraction p0221 A81-48679

AUSTRALIA
Rainforest species on large-scale color photos
p0198 A81-43536
Australian transition year special studies
[E81-10179] p0210 N81-33565

AUTOCORRELATION
An investigation of the autocorrelation function of radar images p0262 A81-49768

AZIMUTH
Wave orbital velocity, fade and SAR response to azimuth waves p0265 N81-33345

B

BACKSCATTERING
Look direction dependence of radar backscattering cross section for agricultural fields p0199 A81-43741
Role of multiple scattering in ozone profile retrieval from satellite measurements in the ultraviolet
p0215 A81-45870
The wind speed dependency of ocean microwave backscatter p0234 A81-46109
Radar altimeter for ocean remote sensing
[IAF PAPER 81-94] p0236 A81-47348
Altimeter rain detection
[NASA-TM-73291] p0275 N81-29408
A review of volume scatter theories for modeling applications p0265 N81-33347

BANDPASS FILTERS
The effect of sensor bandpass and spectral response in crop stress detection p0199 A81-43737

BARLEY
Infrared-temperature variability in a large agricultural field p0200 A81-45432
Evaluation of spring wheat and barley crop calender models for the 1979 crop year
[E81-10197] p0206 N81-29508
A description of the reformatted spring small grains labeling procedure used in test 2, part 2 of the US/Canada wheat and barley exploratory experiment
[E81-10206] p0207 N81-31597
Weather analysis and interpretation procedures developed for the US/Canada wheat and barley exploratory experiment
[E81-10208] p0207 N81-31599
Analysis of US spring wheat and spring barley periodic ground truth
[E81-10203] p0208 N81-32576

BAROTROPIC FLOW
Method for estimation of ocean current velocity from satellite images p0231 A81-41350

BARREN LAND
Remote sensing and land use planning
p0218 A81-49792

BAY ICE
Categorization of Northern Green Bay ice cover using LANDSAT 1 digital data: A case study
[PB81-200436] p0265 N81-32602

BAYES THEOREM
The multicategory case of the sequential Bayesian pixel selection and estimation procedure
[E81-10182] p0263 N81-29498

BAYS (TOPOGRAPHIC FEATURE)
Remote sensing of coastal pollutants using multispectral data p0233 A81-43245

BAYS (TOPOGRAPHIC FEATURES)
Combined satellite imagery for study of coastal circulation, Onslow Bay, North Carolina
p0233 A81-43250
Using enhanced Landsat images for calibrating real time estuarine water quality models p0250 A81-43252
Bay of Fundy verification of a system for multidate Landsat measurement of suspended sediment
p0250 A81-43254
Infrared imagery for studying the Kara-Bogaz-Gol Bay
p0236 A81-48681

BEACHES
Determination of beach sand parameters using remotely sensed aircraft reflectance data p0217 A81-49346

BEAUFORT SEA (NORTH AMERICA)
Operational use of satellite imagery in the Canadian ice program p0238 A81-49754
Experimental use of real time SAR imagery in support of oil exploration in the Beaufort Sea p0227 A81-49767

READEX FICHE best copy available

Airborne impulse radar sounding of sea ice p0238 A81-49771

Single and multiple parameter microwave signatures of sea ice p0238 A81-49774

Radar detection of sea-ice ridges and icebergs in frozen oceans at incidence angles from 0 deg to 90 deg p0238 A81-49775

Comparative analysis of sea ice features using Side-Looking Airborne Radar (SLAR) and LANDSAT imagery --- Beaufort Sea and Bering Sea [E81-10044] p0241 N81-33539

BEDROCK

Ring structures of Precambrian shields, based on the interpretation of space imagery p0225 A81-42278

Applicability of airborne SAR data to geological mapping p0227 A81-49769

BEETLES

Mountain pine beetle damage surveys with high-altitude panoramic photography p0199 A81-43732

BERING SEA

Comparative analysis of sea ice features using Side-Looking Airborne Radar (SLAR) and LANDSAT imagery --- Beaufort Sea and Bering Sea [E81-10044] p0241 N81-33539

BERMUDA

Calibration validation for the GEOS 3 altimeter p0270 A81-42671

BIBLIOGRAPHIES

Millimeter-wave sensing of the environment: A bibliographic survey [NASA-CR-156879] p0219 N81-32581

The application of remote sensing techniques for an ecological land survey of the snow goose colony at Cape Henrietta Maria, Hudson Bay p0204 A81-49791

Thermal inertia mapping of some areas of Quebec based on aerial and HCMM satellite data p0204 A81-49799

Geological and terrain analysis of the Annapolis County region of Nova Scotia - An application of digital Landsat, radar and colour infrared data p0227 A81-49802

CANADIAN SPACE PROGRAMS

The Surveillance Satellite Program and the future of microwave remote sensing p0274 A81-49753

CANOPIES (VEGETATION)

Soil moisture applications of the heat capacity mapping mission p0197 A81-43224

On the analysis of remote sensing data to predict selected vegetative variables p0258 A81-43736

The effect of sensor bandpass and spectral response in crop stress detection p0199 A81-43737

A model of plant canopy polarization response p0201 A81-46035

Does the use of two radiometers correct for irradiance changes during measurements p0272 A81-46196

Remote sensing of thermal radiation from an aircraft - An analysis and evaluation of crop-freeze protection methods p0202 A81-46895

Thermal vegetation canopy model studies p0202 A81-49347

Effect of forest canopy closure on incoming solar radiance [E81-10170] p0205 N81-28499

Soil moisture inferences from thermal infrared measurements of vegetation temperatures [E81-10184] p0206 N81-29500

CAPE HATTERAS (NC)

Method for estimation of ocean current velocity from satellite images p0231 A81-41350

Refraction of coastal ocean waves p0235 A81-46113

CAPILLARY WAVES

Sea surface scattering p0241 N81-33344

CARBON DIOXIDE LASERS

Experimental investigation of the physical fundamentals for remote sensing of soil and vegetation moisture by active infrared reflectance spectroscopy using CO2 laser technique [BMFT-FB-W-80-037] p0211 N81-33588

CASPIAN SEA

Soviet remote sensing of the earth's resources and interpretation of space data with reference to the Caspian Sea, Siberia and the Arctic Ocean [IAF PAPER 81-112] p0278 A81-47355

The use of satellite imagery for studying the structural features of the Caspian oil and gas region p0227 A81-48684

An analysis of the data of synchronous measurements from the Meteor satellite and ships at the eastern coast of the Caspian Sea p0237 A81-48687

CATALOGS (PUBLICATIONS)

Interim catalog ground data summary, data acquisition year 1978 [E81-10132] p0209 N81-33546

CELESTIAL GEODESY

Measurement of lengths, angles, and areas on the earth's spheroid p0221 A81-42846

CENSUS

The application of remote sensing techniques for an ecological land survey of the snow goose colony at Cape Henrietta Maria, Hudson Bay p0204 A81-49791

CENTRAL AMERICA

The methodology of CIAT's land resource study of tropical America p0216 A81-46046

CHARGE TRANSFER DEVICES

The use of charge transfer devices for LANDSAT pattern classification [E81-10087] p0266 N81-33544

CHESAPEAKE BAY (US)

Southern Chesapeake Bay circulation and suspended sediment transport analyzed using Landsat imagery p0252 A81-43747

Landsat observations of snowcover depletion and flooding in the Chesapeake Bay area during the winter of 1979 p0253 A81-48942

Remote sensing in biological oceanography p0237 A81-49130

CHINA

Photogrammetry in China p0222 N81-33526

CHLOROPHYLLS

Atmospheric correction of Nimbus-7 Coastal Zone Color Scanner imagery p0271 A81-45879

Airborne simultaneous spectroscopic detection of laser-induced water Raman backscatter and fluorescence from chlorophyll a and other naturally occurring pigments p0253 A81-47647

Use of water Raman emission to correct airborne laser fluorosensor data for effects of water optical attenuation p0253 A81-47676

An analysis of the data of synchronous measurements from the Meteor satellite and ships at the eastern coast of the Caspian Sea p0237 A81-48687

Remote sensing in biological oceanography p0237 A81-49130

Airborne remote sensing of sea surface chlorophyll and temperature along the outer British Columbia coast p0239 A81-49805

CITIES

Urban area update procedures using Landsat data p0214 A81-43733

CITRUS TREES

Remote sensing of thermal radiation from an aircraft An analysis and evaluation of crop-freeze protection methods p0202 A81-46895

CLASSIFICATIONS

Hydrologic land use classification using Landsat p0247 A81-43213

Accuracy evaluation of Landsat digital classification of vegetation in the Great Dismal Swamp p0248 A81-43235

Using Landsat MSS data with soils information to identify wetland habitats p0249 A81-43236

Assessment and classifications of selected Illinois lakes through the application of space technology p0250 A81-43255

Spatial correlation effects upon accuracy of supervised classification of land cover p0213 A81-43534

A comparison of automatic classification algorithms for land use map by remotely sensed data p0215 A81-44701

Parallel processing implementations of a contextual classifier for multispectral remote sensing data p0272 A81-46028

Procedure M - A framework for stratified area estimation --- in multispectral scanner data processing p0201 A81-46036

Maximum likelihood estimation of label imperfection probabilities and its use in the identification of mislabeled patterns --- with application to Landsat MSS data processing p0259 A81-46040

Context distribution estimation for contextual classification of multispectral image data p0259 A81-46041

Stratification of Landsat data by uniformity productivity of soils p0259 A81-46042

Bulk processing techniques for very large areas - Landsat classification of California p0201 A81-46054

Sampling Landsat classifications for crop area estimation p0202 A81-46404

ICAP - An Interactive Cluster Analysis Procedure for analyzing remotely sensed data p0261 A81-49345

Principal components enhancements versus classifications of Landsat images for forestry applications p0203 A81-49782

Interpretation techniques applied to mixed terrains p0218 A81-49788

Role of aerial photographs in classification of Landsat data p0262 A81-49808

A temporal/spectral analysis of small grain crops and confusion crops --- North Dakota [E81-10167] p0205 N81-28498

Development of advanced acreage estimation methods [E81-10160] p0205 N81-29495

Evaluation of multiband, multitemporal, and transformed LANDSAT MSS data for land cover area estimation --- North Central Missouri
[E81-10161] p0219 N81-29486

Nationwide forestry applications program. Analysis of forest classification accuracy
[E81-10183] p0206 N81-29499

Maximum likelihood clustering with dependent feature trees
[E81-10186] p0263 N81-29502

New output improvements for CLASSY
[E81-10189] p0263 N81-29503

Users manual for the US baseline corn and soybean segment classification procedure
[E81-10190] p0206 N81-29504

Estimation of proportions in mixed pixels through their region characterization
[E81-10199] p0264 N81-29510

Evaluation of large area crop estimation techniques using LANDSAT and ground-derived data --- Missouri
[E81-10200] p0206 N81-29511

Classification of wheat: Badhwar profile similarity technique
[E81-10207] p0207 N81-31598

Improved version of the split routine for CLASSY
[E81-10210] p0264 N81-31600

Identifying igneous rocks in an arid environment on aerial photography by photo tone and photo texture
[AD-A102809] p0228 N81-32587

Categorization of Northern Green Bay ice cover using LANDSAT 1 digital data: A case study
[PB81-200438] p0265 N81-32602

A study of the effects of the atmosphere on thematic mapper observations
[E81-10056] p0276 N81-33540

The use of charge transfer devices for LANDSAT pattern classification
[E81-10087] p0266 N81-33544

AgRISTARS: Foreign commodity production forecasting. Program review presentation to level 1, Interagency Coordination Committee
[E81-10168] p0209 N81-33555

Maximum likelihood labeling
[E81-10177] p0267 N81-33563

Maximum likelihood estimation for mixture models
[E81-10178] p0210 N81-33564

CLIMATE

NOAA Climate Program plan
[PB81-193815] p0240 N81-30765

CLIMATOLOGY

The satellite record of the winter of 1978-79 in North America p0246 A81-43203

Basic problems of the physics and chemistry of contemporary changes of climate p0216 A81-47002

Remote sounding of atmosphere and ocean for climate research /Appleton Lecture/ p0236 A81-47099

Climate, the oceans, and remote sensing p0237 A81-49132

CLOUD COVER

Correlation between integral and spectral albedos of clouds over water surfaces p0235 A81-47004

Methods of editing cloud and atmospheric layer affected pixels from satellite data --- in south Texas test area
[E81-10169] p0266 N81-33556

CLOUD PHOTOGRAPHY

Possible applications of communication satellites for research tasks in polar regions
[BMFT-FB-W-80-029] p0267 N81-33587

CLUMPS

ICAP - An Interactive Cluster Analysis Procedure for analyzing remotely sensed data p0261 A81-49345

COAL

Detection of changes in a coal surface mining area by ratioing multidate Landsat digital data p0228 A81-49809

COASTAL ECOLOGY

Landsat classification of coastal wetlands in Texas p0248 A81-43234

Computer-implemented remote sensing techniques for measuring coastal productivity and nutrient transport systems p0250 A81-43243

A report on the use of remote sensing techniques for the supervision of New England coastal salt marshes p0253 A81-48944

Applications of remote sensing to construction impact assessment at the Roberts Bank Port, British Columbia p0218 A81-49781

The application of remote sensing techniques for an ecological land survey of the snow goose colony at Cape Henrietta Maria, Hudson Bay p0204 A81-49791

COASTAL WATER

Satellite aided coastal zone monitoring and vessel traffic system p0231 A81-41755

Microwave radiometer measurement of tidally induced salinity changes off the Georgia coast p0232 A81-42067

Application of remote sensing to monitoring and studying dispersion in ocean dumping p0232 A81-42228

Remote sensing of coastal pollutants using multispectral data p0233 A81-43245

Aerospace remote sensing of the coastal zone for water quality and biotic productivity applications p0233 A81-43246

Digital analysis of Landsat MSS data and application for coastal marine environment p0233 A81-43247

Satellite observations of a geothermal submarine spring off Florida west coast p0233 A81-43248

Applications of Landsat imagery to a coastal inlet stability study p0250 A81-43249

Combined satellite imagery for study of coastal circulation, Onslow Bay, North Carolina p0233 A81-43250

Drift and dispersion studies of ocean-dumped waste using Landsat imagery and current drogues p0233 A81-43539

Refraction of coastal ocean waves p0235 A81-46113

An analysis of the data of synchronous measurements from the Meteor satellite and ships at the eastern coast of the Caspian Sea p0237 A81-48687

Remote sensing in biological oceanography p0237 A81-49130

Airborne remote sensing of sea surface chlorophyll and temperature along the outer British Columbia coast p0239 A81-49805

Current resource mapping and environmental monitoring applications using Landsat MSS data in Scotland p0218 A81-49806

Coastal Oceans Monitoring Satellite System (COMSS) system evaluation study
[ESS/SS-1035] p0239 N81-30168

Following oceanographic phenomena on the South Coast of Brazil with remote sensing from orbital distance
[INPE-1975-RPE/280] p0240 N81-30498

COASTAL ZONE COLOR SCANNER

Atmospheric correction of Nimbus-7 Coastal Zone Color Scanner imagery p0271 A81-45879

Nimbus-7 Coastal-Zone Colour Scanner data processing for Earthnet Experience to date p0235 A81-46919

Remote sensing in biological oceanography p0237 A81-49130

COHERENT SCATTERING

Coherent and incoherent radar scattering from rough surfaces and vegetated areas --- conferences
[ESA-SP-166] p0208 N81-33339

Introduction to the workshop --- on coherent and incoherent radar scattering from rough surfaces and vegetated areas p0276 N81-33340

COLD WATER

A search for cold water rings p0235 A81-46116

COLOMBIA

Position measurements in Colombia by means of satellite observations p0222 N81-33522

COLOR

Colour - The critical photointerpretation element in the identification of rangeland plant communities on colour and colour-infrared aerial photography p0203 A81-49786

COLOR PHOTOGRAPHY

Some results on the investigation of earth resources by aerial and polygon methods --- Russian book p0269 A81-41476

Pseudocolor representation of multispectral aerial images by means of a three-channel projector p0269 A81-41483

Rainforest species on large-scale color photos p0198 A81-43536

The use of CIR and airborne multispectral scanner techniques for wetland soils mapping of highway corridors p0215 A81-46044

Mapping alpine soils using color positive and color infrared photographs p0252 A81-46045

Nimbus-7 Coastal-Zone Colour Scanner data processing for Earthnet Experience to date p0235 A81-46919

COLORADO

Passive microwave sensing of snow characteristics over land p0246 A81-43207

Landsat derived snow cover as an input variable for snow melt runoff forecasting in South Central Colorado p0246 A81-43208

Monitoring snow with microwaves p0246 A81-43209

Mapping irrigated cropland on the High Plains using Landsat p0198 A81-43266

Mountain pine beetle damage surveys with high-altitude panoramic photography p0199 A81-43732

Aerosol formation, transformation, and effects in Denver's emissions plume p0214 A81-44526

Mapping alpine soils using color positive and color infrared photographs p0252 A81-46045

Procedure 1 and forestland classification using Landsat data p0201 A81-46055

Freshwater ice thickness observations using passive microwave sensors p0254 A81-49968

COLUMBIA RIVER BASIN (ID-OR-WA)

Landsat data as a basis for regional environmental assessment within the Columbia Plateau p0218 A81-49798

COMMUNICATION NETWORKS

Data collection and location by satellite - The Argos system
[IAF PAPER 81-80] p0273 A81-47338

COMMUNICATION SATELLITES

Possible applications of communication satellites for research tasks in polar regions
[BMFT-FB-W-80-029] p0267 N81-33587

COMPARATORS

Application of new precision measuring systems for photogrammetric comparators
[BMFT-FB-T-80-134] p0276 N81-32595

COMPUTER COMPATIBLE TAPES

Automatic processing of computer compatible tapes with data from multispectral scanners installed in Landsat satellites p0272 A81-46029

COMPUTER GRAPHICS

Geological interpretation in an interactive mode in automated systems of digital image processing p0225 A81-42289

Hardware aspects of digital mapping p0271 A81-43530

Interactive processing of Landsat image for morphopedological studies p0259 A81-46043

Interactive system for the regional prognosis of raw mineral resources, based on ground-based and satellite imagery data p0227 A81-48691

The sensor image simulator
[AD-A101172] p0275 N81-29512

Interactive digital image processing for terrain data extraction
[AD-A101321] p0264 N81-30499

OVSUP: A program for computer-aided disentanglement of overlapping zones p0222 N81-33525

Photogrammetry in China p0222 N81-33526

Reports on cartography and geodesy, series 1: Original reports, Number 81
[ISSN-0469-4236] p0222 N81-33527

COMPUTER NETWORKS

A top-down approach to the use of simulation in computer system design --- of Edit Processor of Integrated Photogrammetric Instrument Network p0274 A81-48331

COMPUTER PROGRAMMING

OVSUP: A program for computer-aided disentanglement of overlapping zones p0222 N81-33525

COMPUTER PROGRAMS

Machine method for the equalization of average phototone in an aerial photograph field p0257 A81-41482

Nationwide forestry applications program. Analysis of forest classification accuracy
[E81-10183] p0206 N81-29499

Conversion of SPU-Universal disk file to JSC-Universal tape storage: CONVRT user's guide
[E81-10185] p0263 N81-29501

New output improvements for CLASSY
[E81-10189] p0263 N81-29503

Descriptive and sensitivity analyses of WATBALI: A dynamic soil water model
[E81-10193] p0206 N81-29507

Improved version of the split routine for CLASSY
[E81-10210] p0264 N81-31600

Visual enhancement of images of natural resources: Applications in geology
[E81-10181] p0228 N81-32575

COMPUTER SYSTEMS DESIGN

A top-down approach to the use of simulation in computer system design --- of Edit Processor of Integrated Photogrammetric Instrument Network p0274 A81-48331

COMPUTER SYSTEMS PROGRAMS

As-built design specification of the automatic registration system for the cartographic technology laboratory
[E81-10176] p0267 N81-33562

COMPUTER TECHNIQUES

Experience with image combination in multispectral aerial photography p0257 A81-41481

Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects p0197 A81-41489

Main tasks and methods of operational planning of experiments concerning the observations of the earth from space p0277 A81-42288

Rain estimation over several areas of the globe using satellite imagery p0246 A81-43193

Correlation of geologic structure inferred from computer enhanced Landsat imagery with underground water supplies in Arizona p0225 A81-43227

Computer-implemented remote sensing techniques for measuring coastal productivity and nutrient transport systems p0250 A81-43243

An application of Landsat and computer technology to potential water pollution from soil erosion p0250 A81-43253

Bay of Fundy verification of a system for multidate Landsat measurement of suspended sediment p0250 A81-43254

Automation in photogrammetry p0258 A81-43532

Waveband evaluation of proposed thematic mapper in forest cover classification p0199 A81-43738

Land use mapping of Hong Kong from Landsat images An evaluation p0215 A81-45434

Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, Purdue University, West Lafayette, IN, June 3-6, 1980 p0200 A81-46026

Parallel processing implementations of a contextual classifier for multispectral remote sensing data p0272 A81-46028

A practical method for the verification of computer-processed Landsat data p0261 A81-48943

Computer analysis of Tiros-N/NOAA-6 satellite data for operational snow cover mapping p0262 A81-49795

The use of charge transfer devices for LANDSAT pattern classification
[E81-10087] p0266 N81-33544

COMPUTERIZED SIMULATION

Simulation of orbital image-sensor geometry p0260 A81-46192

A top-down approach to the use of simulation in computer system design --- of Edit Processor of Integrated Photogrammetric Instrument Network p0274 A81-48331

CONFERENCES

Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979 p0243 A81-43176

Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers p0198 A81-43727

Commercial operations in space - 1980-2000, Proceedings of the Eighteenth Goddard Memorial Symposium, Washington, DC, March 27, 28, 1980 p0277 A81-44635

Remote sensing of atmospheres and oceans; Proceedings of the Interactive Workshop on Interpretation of Remotely Senced Data, Williamsburg, VA, May 23-25, 1979 p0234 A81-45861

Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, Purdue University, West Lafayette, IN, June 3-6, 1980 p0200 A81-46026

Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings p0279 A81-49751

Field Study for Remote Sensing: An instructor's manual [NASA-CP-2155] p0279 N81-32564

LANDSAT C workshop field/laboratory exercises p0280 N81-32571

Coherent and incoherent radar scattering from rough surfaces and vegetated areas --- conferences [ESA-SP-166] p0208 N81-33339

CONIFERS

Extravisual damage detection - Defining the standard normal tree p0198 A81-43537

Remote sensing aided procedure for conifer growth modeling in the northeastern Sierra Nevada p0199 A81-43740

Thermal vegetation canopy model studies p0202 A81-49347

SAR image response over a conifer regeneration site p0203 A81-49770

Photointerpretation of fire damage to trees in a ponderosa pine/bunchgrass community p0204 A81-49787

CONSTRUCTION

Remote sensing for engineering site selection [AD-A102810] p0219 N81-32586

CONTEXT

Parallel processing implementations of a contextual classifier for multispectral remote sensing data p0272 A81-46028

Context distribution estimation for contextual classification of multispectral image data p0259 A81-46041

CONTINENTAL SHELVES

Environmental assessment of the Alaskan continental shelf. Reports of principal investigators. Volume 1. Reactors - birds, plankton, littoral, benthos [PB81-196263] p0240 N81-30780

CONTOURS

A technique for line extraction from LANDSAT multi-spectral scanner satellite data with some applications of the technique [RAE-TR-81010] p0265 N81-31613

COORDINATE TRANSFORMATIONS

Derivation of formulas for the correlation of coordinate points of different-scale photographs and quasi-photographs p0261 A81-48772

Position measurements in Colombia by means of satellite observations p0222 N81-33522

COORDINATES

Selection of reference zones for the automatic coordinate control of space images p0261 A81-48693

CORN

An assessment of Landsat data acquisition history on identification and area estimation of corn and soybeans p0200 A81-46032

Large area application of a corn hazard model --- Soviet Union [E81-10164] p0205 N81-28497

Users manual for the US baseline corn and soybean segment classification procedure [E81-10190] p0206 N81-29504

AgRISTARS (Agriculture And Resources Inventory Surveys Through Aerospace Remote Sensing) DC/LC (Domestic Crops and Land Rover) project summary crop area estimates for Kansas and Iowa, 1980 [PB81-196900] p0207 N81-30511

Crop area estimates using ground-gathered and LANDSAT data. A multitemporal approach: Missouri, 1979 [PB81-186751] p0208 N81-31614

A project to evaluate moisture stress and phenological factors in corn and soybean areas of southwestern and south-central Minnesota p0209 N81-33554

COSMOS SATELLITES

Evaluation of the 1980 Cosmos program p0278 A81-47829

COST EFFECTIVENESS

Benefits of using airborne remote sensing for Thematic Mapping p0275 A81-49801

CROP CALENDARS

Selected irrigation acreage estimates in northern Florida from Landsat data p0198 A81-43264

Large area application of a corn hazard model --- Soviet Union [E81-10164] p0205 N81-28497

Evaluation of spring wheat and barley crop calender models for the 1979 crop year [E81-10197] p0206 N81-29508

Crop phenology and LANDSAT-based irrigated lands inventory in the high plains: Appendices [E81-10172] p0210 N81-33558

Crop phenology and LANDSAT-based irrigated lands inventory in the high plains [E81-10173] p0210 N81-33559

Australian transition year special studies [E81-10179] p0210 N81-33565

CROP GROWTH

The effect of sensor bandpass and spectral response in crop stress detection p0199 A81-43737

Infrared-temperature variability in a large agricultural field p0200 A81-45432

Stratification of Landsat data by uniformity productivity of soils p0259 A81-46042

Operational applications for analysis of agricultural crops and cultural practices p0203 A81-49756

A temporal/spectral analysis of small grain crops and confusion crops --- North Dakota [E81-10167] p0205 N81-28498

Weather analysis and interpretation procedures developed for the US/Canada wheat and barley exploratory experiment [E81-10208] p0207 N81-31599

Dryland pasture and crop conditions as seen by HCMM [E81-10080] p0209 N81-33542

A crop moisture stress index for large areas and its application in the prediction of spring wheat phenology [E81-10202] p0210 N81-33573

CROP IDENTIFICATION

Accuracy of transmission of spectral contrasts in multispectral aerial photography, with application to problems of object recognition p0257 A81-41479

Results of ground surveys, carried out in conjunction with satellite and aerial studies, of the state of winter wheat on the Kursk test polygon p0197 A81-41485

Determination of the types and state of crops from multispectral aerial photographs p0197 A81-41486

The possibilities of the automated classification of agricultural objects on the basis of their multispectral aerial-spaceborne images p0197 A81-41488

Selected irrigation acreage estimates in northern Florida from Landsat data p0198 A81-43264

An assessment of Landsat data acquisition history on identification and area estimation of corn and soybeans p0200 A81-46032

Crop classification with a Landsat/radar sensor combination p0200 A81-46033

Comparison of Landsat-2 and field spectrometer reflectance signatures of south Texas rangeland plant communities p0201 A81-46034

A model of plant canopy polarization response p0201 A81-46035

Procedure M - A framework for stratified area estimation --- in multispectral scanner data processing p0201 A81-46036

Operational applications for analysis of agricultural crops and cultural practices p0203 A81-49756

Rapeseed - Guidelines for operational monitoring p0203 A81-49784

The discrimination of cereal crops and legumes using reflectance data in the Landsat bandpasses p0204 A81-49794

A simulation of Thematic Mapper performance in an agricultural application p0204 A81-49810

Evaluation of Thematic Mapper bands - A first step in feature selection p0205 A81-49815

A description of the reformatted spring small grains labeling procedure used in test 2, part 2 of the US/Canada wheat and barley exploratory experiment [E81-10206] p0207 N81-31597

Classification of wheat: Badhwar profile similarity technique [E81-10207] p0207 N81-31598

Scatterometer measurements on crop and soil surfaces p0208 N81-33349

CROP INVENTORIES

Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects p0197 A81-41489

A multistage mapping approach for an irrigated croplands inventory p0198 A81-43262

Crop reporting from space - Problems, promises, potential [AAS 80-062] p0200 A81-44637

An assessment of Landsat data acquisition history on identification and area estimation of corn and soybeans p0200 A81-46032

Procedure M - A framework for stratified area estimation --- in multispectral scanner data processing p0201 A81-46036

Sampling Landsat classifications for crop area estimation p0202 A81-46404

Remote sensing in development --- for developing nations p0279 A81-48936

Integration and comparison of SAR and MSS data for potato crop area estimation p0203 A81-49766

Development of advanced acreage estimation methods [E81-10160] p0205 N81-29495

The multicategory case of the sequential Bayesian pixel selection and estimation procedure [E81-10182] p0263 N81-29498

Users manual for the US baseline corn and soybean segment classification procedure [E81-10190] p0206 N81-29504

Estimation of proportions in mixed pixels through their region characterization [E81-10199] p0264 N81-29510

Crop area estimation using ground-gathered and sampled LANDSAT data [PB81-192783] p0207 N81-30507

Atmospheric nitric acid and chlorofluoromethane 11 from interferometric spectra obtained at the Observatoire du Pic du Midi [AERONOMICA-ACTA-A-227-1980] p0219 N81-30656

Crop area estimates using ground-gathered and LANDSAT data. A multitemporal approach: Missouri, 1979 [PB81-186751] p0208 N81-31614

Analysis of US spring wheat and spring barley periodic ground truth [E81-10203] p0208 N81-32576

Yield Model Development (YMD) implementation plan for fiscal years 1981 and 1982 [E81-10211] p0208 N81-32577

AgRISTARS: Foreign commodity production forecasting. Program review presentation to level 1, Interagency Coordination Committee [E81-10168] p0209 N81-33555

Maximum likelihood estimation for mixture models [E81-10178] p0210 N81-33564

Australian transition year special studies [E81-10179] p0210 N81-33565

CROP VIGOR

Some results on the investigation of earth resources by aerial and polygon methods --- Russian book p0269 A81-41476

Results of ground surveys, carried out in conjunction with satellite and aerial studies, of the state of winter wheat on the Kursk test polygon p0197 A81-41485

Determination of the types and state of crops from multispectral aerial photographs p0197 A81-41486

Vegetable crop management with remote sensing p0198 A81-43540

Relating ground level reflected radiance measurements in the Landsat MSS bandpasses to satellite altitudes p0271 A81-43735

A model of plant canopy polarization response p0201 A81-46035

Meteorological satellite data: A tool to describe the health of the world's agriculture [E81-10204] p0207 N81-31596

Weather analysis and interpretation procedures developed for the US/Canada wheat and barley exploratory experiment [E81-10208] p0207 N81-31599

CYCLONES

The occurrence of vertical tilt in tropical cyclones p0238 A81-49656

Eastern North Pacific tropical cyclones of 1980 p0238 A81-49657

D

DAMAGE ASSESSMENT

Extravisual damage detection - Defining the standard normal tree p0198 A81-43537

Mountain pine beetle damage surveys with high-altitude panoramic photography p0199 A81-43732

Photointerpretation of fire damage to trees in a ponderosa pine/bunchgrass community p0204 A81-49787

DAMS

Remote sensing of bank erosion along the Missouri River, South Dakota p0213 A81-43263

Use of Landsat images in the monitoring and study of the LG 2 reservoir during the filling period p0254 A81-49797

DATA ACQUISITION

Aerial data acquisition systems using test-ground polygons p0269 A81-41477

The methodology of CIAT's land resource study of tropical America p0216 A81-46046

First results of the Intercosmos satellite IK-21 [IAF PAPER 81-214] p0274 A81-47409

Acquisition and preprocessing of images collected by future European Space Agency satellites p0263 A81-49814

Scatterometer calibration and data correction p0265 N81-33351

DATA BASES

Development of a digital data base for reflectance-related soil information p0201 A81-46051

Evaluation of remote sensing data for input into Hydrological Simulation Program-FORTRAN (HSPF) --- modeling the Occoquan watershed in Virginia using LANDSAT imagery for parameter estimation [PB81-209561] p0255 N81-33593

DATA COLLECTION PLATFORMS
Remote sensing of oceanic phytoplankton - Present capabilities and future goals p0232 A81-42215
The GOES data collection system p0257 A81-43185
Adapting GOES DCS for use by Corps of Engineers --- for flood control p0244 A81-43186
U.S. geological survey application of satellite telemetry for the support of hydrologic data collection p0258 A81-43189
Advanced technology for satellite data collection systems p0270 A81-43190
Data collection and location by satellite - The Argos system [IAF PAPER 81-80] p0273 A81-47338
Physical and technical foundations for the development of subsatellite systems for the exploration of natural earth resources [IAF PAPER 81-101] p0278 A81-47350
Meteorological applications of the ARGOS system [IAF PAPER 81-121] p0273 A81-47360
DATA COMPRESSION
Comparative experimental study on the use of original and compressed multispectral Landsat data of the Bayuda desert p0262 A81-49813
DATA CONVERSION ROUTINES
Conversion of SPU-Universal disk file to JSC-Universal tape storage: CONVRT user's guide [E81-10185] p0263 N81-29501
DATA CORRELATION
Correlation of geologic structure inferred from computer enhanced Landsat imagery with underground water supplies in Arizona p0225 A81-43227
Correlation techniques and devices --- for photogrammetry p0258 A81-43531
An investigation of the autocorrelation function of radar images p0262 A81-49768
As-built design specification of the automatic registration system for the cartographic technology laboratory [E81-10176] p0267 N81-33562
DATA MANAGEMENT
Interim catalog ground data summary. data acquisition year 1978 [E81-10132] p0209 N81-33546
DATA PROCESSING
A review of Canada's present and future remote sensing activities relating to hydrology p0244 A81-43182
Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey. Proceedings of the Sixth Annual Symposium, Purdue University, West Lafayette, IN, June 3-6, 1980 p0200 A81-46026
Automatic processing of computer compatible tapes with data from multispectral scanners installed in Landsat satellites p0272 A81-46029
The Lulea Image Processing System /LIPS/ - A versatile approach to earth resources data processing p0272 A81-46030
A practical method for the verification of computer-processed Landsat data p0261 A81-48943
Evaluation of multiband, multitemporal, and transformed LANDSAT MSS data for land cover area estimation --- North Central Missouri [E81-10161] p0219 N81-29496
Maximum likelihood clustering with dependent feature trees [E81-10186] p0263 N81-29502
Computer program documentation user information for the RSO-tape print program (RSOPRNT) [E81-10198] p0264 N81-29509
Reports on cartography and geodesy. series 1: Original reports, Number 81 [ISSN-0469-4236] p0222 N81-33527
DATA PROCESSING EQUIPMENT
Hardware aspects of digital mapping p0271 A81-43530
DATA REDUCTION
Regression techniques for oceanographic parameter retrieval using space-borne microwave radiometry p0239 A81-49967
Reduction and analysis of satellite magnetometer data p0275 N81-29482
An analysis of haze effects on LANDSAT multispectral scanner data [E81-10162] p0263 N81-29497
Knowledge-based image analysis [AD-A101319] p0264 N81-30852
Methods of editing cloud and atmospheric layer affected pixels from satellite data --- in south Texas test area [E81-10169] p0266 N81-33556
DATA SAMPLING
Comparison of sampling procedures and data analysis for a land-use and land-cover map p0213 A81-43533
DATA SYSTEMS
Oceanic Satellite Data Distribution System p0231 A81-41996
The GOES data collection system p0257 A81-43185
Adapting GOES DCS for use by Corps of Engineers --- for flood control p0244 A81-43186
Requirements on the data/information system --- of satellite systems for earth resources observation p0278 A81-48527
DATA TRANSMISSION
Program and instrumentation of the satellite experiment Bulgaria-1300 II [IAF PAPER 81-91] p0273 A81-47345
DEFOLIATION
Effect of forest canopy closure on incoming solar radiance [E81-10170] p0205 N81-28499
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions [E81-10081] p0208 N81-33543
DELTA MODULATION
Application of delta modulation in on-board and ground video data processing systems for the purposes of remote sensing [IAF PAPER 81-102] p0260 A81-47351
DEMOGRAPHY
The application of remote sensing techniques for an ecological land survey of the snow goose colony at Cape Henrietta Maria, Hudson Bay p0204 A81-49791
DESERTS
Remote methods and desert conservation --- Russian book p0213 A81-43523
Angular anisotropy of reflection from various types of underlying surface. I - Snow cover. II - Desert p0260 A81-47007
Comparative experimental study on the use of original and compressed multispectral Landsat data of the Bayuda desert p0262 A81-49813
Terrain profiling from Seasat altimetry [NASA-CR-156878] p0222 N81-31604
Landform-vegetation relationships in the northern Chihuahuan Desert [AD-A102896] p0208 N81-32588
DEVELOPING NATIONS
Hydrogeologic interpretations of Landsat imagery in arid zones of South and West Africa p0248 A81-43229
Using Landsat imagery to study the Okavango Swamp, Botswana p0249 A81-43242
Remote sensing in development --- for developing nations p0279 A81-48936
DICIDUOUS TREES
Thermal vegetation canopy model studies p0202 A81-49347
DIFFRACTION PATTERNS
Fourier modulus image construction [AD-A101728] p0264 N81-30723
DIFFUSE RADIATION
Effect of forest canopy closure on incoming solar radiance [E81-10170] p0205 N81-28499
DIGITAL DATA
Hardware aspects of digital mapping p0271 A81-43530
Water quality mapping from Landsat digital data p0252 A81-45429
Use of Landsat digital data to assist in mapping soils on Arizona rangelands p0201 A81-46047
Development of a digital data base for reflectance-related soil information p0201 A81-46051
Radiometry with nighttime DMSP images in digital form --- satellite earth observations p0260 A81-46402
Application of temporal Landsat forest digital data for updating the Yukon RRAMS data base using Aries --- Renewable Resources And Management Statistics p0203 A81-49760
An investigation of the autocorrelation function of radar images p0262 A81-49768
Research on assessment of the recreational value of forests using Landsat digital data p0203 A81-49785
Detection of changes in a coal surface mining area by ratioing multidate Landsat digital data p0228 A81-49809
Categorization of Northern Green Bay ice cover using LANDSAT 1 digital data: A case study [PB81-200436] p0265 N81-32602
Methods of editing cloud and atmospheric layer affected pixels from satellite data --- in south Texas test area [E81-10169] p0266 N81-33556
DIGITAL SIMULATION
The sensor image simulator [AD-A101172] p0275 N81-29512
DIGITAL TECHNIQUES
A rectification technique for digital orthophoto production p0257 A81-41057
Geological interpretation in an interactive mode in automated systems of digital image processing p0225 A81-42289
Flood applications of satellite imagery p0247 A81-43217
Ground water exploration programs in Africa p0226 A81-43230
Accuracy evaluation of Landsat digital classification of vegetation in the Great Dismal Swamp p0248 A81-43235
Digital analysis of Landsat MSS data and application for coastal marine environment p0233 A81-43247
Lake Ontario dynamics and water quality observations using thematically enhanced Landsat data p0251 A81-43257
Hardware aspects of digital mapping p0271 A81-43530
Automation in photogrammetry p0258 A81-43532
Wetland mapping from digitized aerial photography p0252 A81-43549
Rainbow 80: Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers p0198 A81-43727
Urban area update procedures using Landsat data p0214 A81-43733
Manual versus digital Landsat analysis for modeling river flooding p0252 A81-43745
Application of digital terrain data to quantify and reduce the topographic effect on Landsat data p0259 A81-45433
Land use mapping of Hong Kong from Landsat images An evaluation p0215 A81-45434
Procedures for change detection using Landsat digital data p0215 A81-45437
Automatic processing of computer compatible tapes with data from multispectral scanners installed in Landsat satellites p0272 A81-46029
The Lulea Image Processing System /LIPS/ - A versatile approach to earth resources data processing p0272 A81-46030
Radar image preprocessing --- of SEASAT-A SAR data p0272 A81-46038
Lineament mapping in northern Sweden from Landsat images using orthogonal image transforms p0226 A81-46039
Inventory estimation on the massively parallel processor --- from satellite based images p0259 A81-46052
Bulk processing techniques for very large areas - Landsat classification of California p0201 A81-46054
Change vector analysis - An approach for detecting forest changes with Landsat p0202 A81-46056
Manual versus digital Landsat analysis for delineating river flooding p0252 A81-46405
Applications of remote sensing to construction impact assessment at the Roberts Bank Port, British Columbia p0218 A81-49781
Digital enhancements for vegetation mapping in a subarctic environment p0262 A81-49793
Generation and use of digital elevation data for large areas p0221 A81-49811
Interactive digital image processing for terrain data extraction [AD-A101321] p0264 N81-30499
Development of alternative data analysis techniques for improving the accuracy and specificity of natural resource inventories made with remote sensing data p0266 N81-33551
DISASTERS
Potential for detection of natural disasters via Meteosat [IAF PAPER 81-263] p0216 A81-47430
Analysis of the November 23, 1980 earthquake as a design basis for satellite emergency communication [IAF PAPER 81-269] p0216 A81-47433
DISPLAY DEVICES
An evaluation of detail in dynamic visual displays [AD-A103378] p0222 N81-33578
DOPPLER EFFECT
Differential Doppler experiment /DIDEX/ for geodetic applications p0221 A81-47938
Optimization of Doppler measurements in the satellite network of Eastern Europe p0221 A81-48678
DOPPLER NAVIGATION
Position measurements in Colombia by means of satellite observations p0222 N81-33522
DOPPLER RADAR
Satellite To Satellite Doppler Tracking (SSDT) for mapping of the Earth's gravity field [NASA-CR-164722] p0223 N81-31601
DRAINAGE
A technique for improved assessment of flow resistance characteristics of natural wetlands using Landsat data p0249 A81-43241
Remote sensing for engineering site selection [AD-A102810] p0219 N81-32586
DRAINAGE PATTERNS
A technique for improved assessment of flow resistance characteristics of natural wetlands using Landsat data p0249 A81-43241
Cornell University Remote Sensing Program [E81-10174] p0255 N81-33560
DREDGED MATERIALS
Landsat data for regulatory permit monitoring p0247 A81-43214
DROUGHT
The environmental vegetation index: A tool potentially useful for arid land management --- Texas and Mexico, plant growth stress due to water deficits [E81-10191] p0206 N81-29506
DUMPING
Application of remote sensing to monitoring and studying dispersion in ocean dumping p0232 A81-42228
Drift and dispersion studies of ocean-dumped waste using Landsat imagery and current drogues p0233 A81-43539

E

EARTH ALBEDO
The effect of angular distribution models on the estimation of the earth's albedo p0269 A81-41915
EARTH CRUST
Gravimetric studies of the earth's crust in the oceans --- Russian book p0221 A81-43524
Magnetic space-based field measurements [AAS PAPER 81-077] p0272 A81-46241

NASA selects scientific investigations for Earth dynamics studies [NASA-NEWS-RELEASE-81-129] p0228 N81-29143

Satellite To Satellite Doppler Tracking (SSDT) for mapping of the Earth's gravity field [NASA-CR-164722] p0223 N81-31601

Investigation of Antarctic crust and upper mantle using Magsat and other geophysical data [E81-10113] p0222 N81-32574

EARTH HYDROSPHERE

Preliminary survey of HCMM satellite thermal imagery as applied to hydrospherics p0252 A81-43746

EARTH OBSERVATIONS (FROM SPACE)

Passive microwave techniques for geophysical sensing of the earth from satellites p0270 A81-43071

Radar methods for studying the earth --- Russian book p0273 A81-46924

EARTH ORBITS

Simulation of orbital image-sensor geometry p0260 A81-46192

EARTH RADIATION BUDGET EXPERIMENT

The effect of angular distribution models on the estimation of the earth's albedo p0269 A81-41915

A radiometric model of an earth radiation budget radiometer optical system with diffuse-specular surfaces p0269 A81-41919

EARTH RESOURCES

Large scale human benefits of space industrialization p0277 A81-42513

EARTH SURFACE

Concerning the possibility of improving the spectroradiometric accuracy of remote sensing of the earth by means of multispectral band scanners p0270 A81-42285

Angular anisotropy of reflection from various types of underlying surface I - Snow cover II - Desert p0260 A81-47007

Selection of reference zones for the automatic coordinate control of space images p0261 A81-48693

Geometric correction of scanner images of the earth's surface p0261 A81-48694

Experimental investigation of the physical fundamentals for remote sensing of soil and vegetation moisture by active infrared reflectance spectroscopy using CO2 laser technique [BMFT-FB-W-80-037] p0211 N81-33588

EARTHQUAKES

Space research on seismic regions p0225 A81-42280

Analysis of the November 23, 1980 earthquake as a design basis for satellite emergency communication [IAF PAPER 81-269] p0216 A81-47433

ECOLOGY

Remote sensing of oceanic phytoplankton - Present capabilities and future goals p0232 A81-42215

Remote methods and desert conservation --- Russian book p0213 A81-43523

Multistage remote sensing in exploratory ecodistrict land classification p0217 A81-49759

The application of remote sensing techniques for an ecological land survey of the snow goose colony at Cape Henrietta Maria, Hudson Bay p0204 A81-49791

ECONOMIC DEVELOPMENT

What does space remote sensing provide p0278 A81-47826

Space Benefits: The secondary application of aerospace technology in other sectors of the economy [NASA-CR-164733] p0279 N81-32086

ECONOMIC FACTORS

Efficiency criteria of space systems for studying the earth's natural resources p0277 A81-42287

Large scale human benefits of space industrialization p0277 A81-42513

ECOSYSTEMS

Simulation modeling of estuarine ecosystems p0243 A81-42229

Dynamic ecosystem of the Aral Basin studied from satellite imagery p0217 A81-48682

EDITING

A top-down approach to the use of simulation in computer system design --- of Edit Processor of Integrated Photogrammetric Instrument Network p0274 A81-48331

EDUCATION

Field Study for Remote Sensing: An instructor's manual [NASA-CP-2155] p0279 N81-32564

Why surface-truth field study is needed in remote-sensing instruction p0280 N81-32567

ELECTRIC POWER PLANTS

Environmental measurements of power plant cooling tower and stack plumes [DOE/EV-02463/6] p0219 N81-30695

ELECTROMAGNETIC NOISE

Geomagnetic field mapping from a satellite: Spatial power spectra of the geomagnetic field at various satellite altitudes relative to natural noise sources and instrument noise [PUBL-1810] p0275 N81-29480

ELEVATION

Use of elevation models for landform analysis by Seasat-SAR imagery [IAF PAPER 81-98] p0260 A81-47349

EMERGENCIES

Analysis of the November 23, 1980 earthquake as a design basis for satellite emergency communication [IAF PAPER 81-269] p0216 A81-47433

ENERGY BUDGETS

Thermal vegetation canopy model studies p0202 A81-49347

ENERGY SPECTRA

Spatial evolution of ocean wave spectra p0235 A81-46112

ENVIRONMENT EFFECTS

Basic problems of the physics and chemistry of contemporary changes of climate p0216 A81-47002

Applications of remote sensing to construction impact assessment at the Roberts Bank Port, British Columbia p0218 A81-49781

ENVIRONMENT MODELS

Simulation modeling of estuarine ecosystems p0243 A81-42229

ENVIRONMENT PROTECTION

Remote methods and desert conservation --- Russian book p0213 A81-43523

ENVIRONMENTAL MONITORING

Environmental satellites p0277 A81-42231

Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979 p0243 A81-43176

Corps of Engineers utilization of satellites for hydrologic purposes p0244 A81-43180

The GOES data collection system p0257 A81-43185

Monitoring Canada's water resources in remote regions by satellite telemetry p0244 A81-43188

Landsat data for regulatory permit monitoring p0247 A81-43214

Remote methods and desert conservation --- Russian book p0213 A81-43523

Use of remote sensing in landscape stratification for environmental impact assessment p0214 A81-43748

Commercial operations in space - 1980-2000; Proceedings of the Eighteenth Goddard Memorial Symposium, Washington, DC, March 27, 28, 1980 p0277 A81-44635

Procedures for change detection using Landsat digital data p0215 A81-45437

First Shuttle payload loading to begin p0273 A81-46461

Soviet remote sensing of the earth's resources and interpretation of space data with reference to the Caspian Sea, Siberia and the Arctic Ocean [IAF PAPER 81-112] p0278 A81-47355

Monitoring of snow covered area using satellite data [IAF PAPER 81-114] p0253 A81-47356

Potential for detection of natural disasters via Meteosat [IAF PAPER 81-263] p0216 A81-47430

Analysis of the November 23, 1980 earthquake as a design basis for satellite emergency communication [IAF PAPER 81-269] p0216 A81-47433

A report on the use of remote sensing techniques for the supervision of New England coastal salt marshes p0253 A81-48944

International monitoring from space /Problems of international law/ --- Russian book p0279 A81-49468

Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings p0279 A81-49751

The integration of remote sensing in environmental decision making for the Maritimes p0217 A81-49752

The Surveillance Satellite Program and the future of microwave remote sensing p0274 A81-49753

Present state of remote sensing development in Poland p0279 A81-49763

Current resource mapping and environmental monitoring applications using Landsat MSS data in Scotland p0218 A81-49806

Detection of changes in a coal surface mining area by ratioing multidate Landsat digital data p0228 A81-49809

Use of satellite pictures for agriculture p0205 N81-28120

A remote sensing technique to monitor Cladophora in the Great Lakes [PB81-173841] p0254 N81-29520

Conceptual design of an automated mapping satellite System (MAPSAT) [PB81-185555] p0264 N81-29522

Environmental measurements of power plant cooling tower and stack plumes [DOE/EV-02463/6] p0219 N81-30695

NOAA Climate Program plan [PB81-193815] p0240 N81-30765

Lakewide monitoring of suspended solids using satellite data --- Lake Superior water reclamation p0254 N81-33552

ENVIRONMENTAL SURVEYS

Use of remote sensing in landscape stratification for environmental impact assessment p0214 A81-43748

EQUATORIAL REGIONS

Drifting buoy data from the tropical Pacific Ocean during NORPAX equatorial test shuttle experiment [PB81-198939] p0240 N81-31807

ERROR ANALYSIS

Accuracy of transmission of spectral contrasts in multispectral aerial photography, with application to problems of object recognition p0257 A81-41479

Insights into errors of SMS-inferred GATE convective rainfall p0243 A81-42095

Spatial correlation effects upon accuracy of supervised classification of land cover p0213 A81-43534

Maximum likelihood estimation of label imperfection probabilities and its use in the identification of mislabeled patterns --- with application to Landsat MSS data processing p0259 A81-46040

ERS-1 (ESA SATELLITE)

The first ESA remote sensing satellite /ERS/ - The programme and the system [IAF PAPER 81-90] p0236 A81-47344

Acquisition and preprocessing of images collected by future European Space Agency satellites p0263 A81-49814

ESA SATELLITES

The remote sensing satellite program of the European Space Agency p0278 A81-49762

ESTUARIES

Simulation modeling of estuarine ecosystems p0243 A81-42229

Using enhanced Landsat images for calibrating real time estuarine water quality models p0250 A81-43252

Remote sensing of dinoflagellate blooms in a turbid estuary p0251 A81-43538

EUROPE

The European SAR-Project Convair 580 p0273 A81-46679

Satellite observations of England and north-western Europe p0217 A81-49174

EUTROPHICATION

Trophic state determination for shallow coastal lakes from Landsat imagery p0251 A81-43259

EVAPORATION

Descriptive and sensitivity analyses of WATBALI: A dynamic soil water model [E81-10193] p0206 N81-29507

EVAPOTRANSPIRATION

Modeling the terrestrial hydrology for the global atmosphere - The future role of satellite data p0245 A81-43197

Improvements in lake volume predictions using Landsat data p0248 A81-43237

Agricultural water demand prediction using remote sensing technology for Georgia resource management [PB81-184137] p0207 N81-30508

A crop moisture stress index for large areas and its application in the prediction of spring wheat phenology [E81-10202] p0210 N81-33573

EVERGALDES (FL)

Landsat hydrobiological classification for an inland fresh water marsh within Everglades National Park p0249 A81-43238

F

FADING

Wave orbital velocity, fade and SAR response to azimuth waves p0265 N81-33345

FARM CROPS

Spatial correlation effects upon accuracy of supervised classification of land cover p0213 A81-43534

Operational applications for analysis of agricultural crops and cultural practices p0203 A81-49756

Rapeseed - Guidelines for operational monitoring p0203 A81-49784

Evaluation of large area crop estimation techniques using LANDSAT and ground-derived data --- Missouri [E81-10200] p0206 N81-29511

Crop area estimation using ground-gathered and sampled LANDSAT data [PB81-192783] p0207 N81-30507

AgRISTARS: Foreign commodity production forecasting. Program review presentation to level 1, Interagency Coordination Committee [E81-10168] p0209 N81-33555

Crop phenology and LANDSAT-based irrigated lands inventory in the high plains: Appendices [E81-10172] p0210 N81-33558

Crop phenology and LANDSAT-based irrigated lands inventory in the high plains [E81-10173] p0210 N81-33559

FARMLANDS

Pseudocolor representation of multispectral aerial images by means of a three-channel projector p0269 A81-41483

A multistage mapping approach for an irrigated croplands inventory p0198 A81-43262

Remote sensing of bank erosion along the Missouri River, South Dakota p0213 A81-43263

Mapping irrigated lands in Western Kansas from Landsat p0198 A81-43265

Mapping irrigated cropland on the High Plains using Landsat p0198 A81-43266

Look direction dependence of radar backscattering cross section for agricultural fields p0199 A81-43741

Infrared-temperature variability in a large agricultural field p0200 A81-45432

Remote sensing and land use planning p0218 A81-49792

Evaluation of gravimetric ground truth soil moisture data collected for the agricultural soil moisture experiment, 1978 Colby, Kansas, aircraft mission [E81-10114] p0206 N81-29494

Satellite monitoring of snow extent and condition in agricultural, transitional, and forested land cover areas [PB81-188625] p0254 N81-30509

Dryland pasture and crop conditions as seen by HCMM
[E81-10080] p0209 N81-33542
Measurement of soil moisture trends with airborne scatterometers --- Texas
[E81-10088] p0209 N81-33545
A project to evaluate moisture stress and phenological factors in corn and soybean areas of southwestern and south-central Minnesota p0209 N81-33554
Crop phenology and LANDSAT-based irrigated lands inventory in the high plains: Appendices
[E81-10172] p0210 N81-33558
Crop phenology and LANDSAT-based irrigated lands inventory in the high plains
[E81-10173] p0210 N81-33559

FEDERAL BUDGETS
NASA authorization, 1982, volume 4
[GPO-79-432-VOL-4] p0279 N81-31030

FIELD OF VIEW
Infrared-temperature variability in a large agricultural field p0200 A81-45432
The characteristics of combining devices with different survey bands aboard a satellite p0274 A81-48689

FISHERIES
Remote sensing in biological oceanography p0237 A81-49130
Meteosat experience in assisting commercial fishing p0239 A81-49807

FISHES
NOAA Climate Program plan
[PB81-193815] p0240 N81-30765

FLAGELLATA
Remote sensing of dinoflagellate blooms in a turbid estuary p0251 A81-43538

FLATS (LANDFORMS)
Infrared imagery for studying the Kara-Bogaz-Gol Bay p0236 A81-48681

FLOOD CONTROL
Adapting GOES DCS for use by Corps of Engineers --- for flood control p0244 A81-43186

FLOOD PLAINS
Use of Landsat images in the monitoring and study of the LG 2 reservoir during the filling period p0254 A81-49797

FLOOD PREDICTIONS
The use of satellite data in predicting spring flow in the basins of the upper Ob' and upper Enisei p0243 A81-41723
Satellite applications in river and flood forecasting p0243 A81-43178
A satellite derived technique for estimating rainfall from thunderstorms and hurricanes p0244 A81-43191
A statistical approach to rainfall estimation using satellite data p0245 A81-43198
Improving stream flow estimates through the use of Landsat p0247 A81-43216
Manual versus digital Landsat analysis for modeling river flooding p0252 A81-43745

FLOODS
Flood applications of satellite imagery p0247 A81-43217
Assessing the Red River of the North 1978 flooding from NOAA satellite data p0248 A81-43219
A preliminary analysis of SAR mapping of the Manitoba flood, May 1979 p0248 A81-43220
Manual versus digital Landsat analysis for modeling river flooding p0252 A81-43745
Manual versus digital Landsat analysis for delineating river flooding p0252 A81-46405
Landsat observations of snowcover depletion and flooding in the Chesapeake Bay area during the winter of 1979 p0253 A81-48942

FLORIDA
Improvements in lake volume predictions using Landsat data p0249 A81-43237
A technique for improved assessment of flow resistance characteristics of natural wetlands using Landsat data p0249 A81-43241
Satellite observations of a geothermal submarine spring off Florida west coast p0233 A81-43248
Applications of Landsat imagery to a coastal inlet stability study p0250 A81-43249
Using enhanced Landsat images for calibrating real time estuarine water quality models p0250 A81-43252
Comparison of sampling procedures and data analysis for a land-use and land-cover map p0213 A81-43533
Vegetable crop management with remote sensing p0198 A81-43540
Remote sensing of thermal radiation from an aircraft - An analysis and evaluation of crop-freeze protection methods p0202 A81-46895

FLUORESCENCE
Airborne simultaneous spectroscopic detection of laser-induced water Raman backscatter and fluorescence from chlorophyll a and other naturally occurring pigments p0253 A81-47647
Use of water Raman emission to correct airborne laser fluorosensor data for effects of water optical attenuation p0253 A81-47676
Compact and highly sensitive fluorescence lidar for oceanographic measurements p0237 A81-49378

FLUOROHYDROCARBONS
Atmospheric nitric acid and chlorofluoromethane 11 from interferometric spectra obtained at the Observatoire du Pic du Midi
[AERONOMICA-ACTA-A-227-1980] p0219 N81-30656

FOREST FIRES
Photointerpretation of fire damage to trees in a ponderosa pine/bunchgrass community p0204 A81-49787

FOREST MANAGEMENT
Extravisual damage detection - Defining the standard normal tree p0198 A81-43537
Remote sensing aided procedure for conifer growth modeling in the northeastern Sierra Nevada p0199 A81-43740
Change vector analysis - An approach for detecting forest changes with Landsat p0202 A81-46056
The space engineering use efficiency for forest study
[IAF PAPER 81-108] p0202 A81-47354
Forestry priorities and their implications for the Canadian Remote Sensing Program p0202 A81-49755
The application of thermography for locating potential frost pockets in forest cutovers p0204 A81-49789

FORESTS
Spatial correlation effects upon accuracy of supervised classification of land cover p0213 A81-43534
Waveband evaluation of proposed thematic mapper in forest cover classification p0199 A81-43738
Use of Seasat satellite radar imagery for the detection of standing water beneath forest vegetation p0199 A81-43743
A photo interpretation approach to forest regrowth monitoring using side-looking airborne radar - Grant County, Oregon p0200 A81-45428
Bulk processing techniques for very large areas - Landsat classification of California p0201 A81-46054
Procedure 1 and forestland classification using Landsat data p0201 A81-46055
Thermal vegetation canopy model studies p0202 A81-49347
Application of temporal Landsat forest digital data for updating the Yukon RRAMS data base using Aries --- Renewable Resources And Management Statistics p0203 A81-49760
Present state of remote sensing development in Poland p0279 A81-49763
Technical aspects of forest inventory demonstrations using Landsat data - Projects in the Pacific Northwest States p0203 A81-49764
SAR image response over a conifer regeneration site p0203 A81-49770
Principal components enhancements versus classifications of Landsat images for forestry applications p0203 A81-49782
Research on assessment of the recreational value of forests using Landsat digital data p0203 A81-49785
Effect of forest canopy closure on incoming solar radiance
[E81-10170] p0205 N81-28499
Nationwide forestry applications program. Analysis of forest classification accuracy
[E81-10183] p0206 N81-29499
Interactive digital image processing for terrain data extraction
[AD-A101321] p0264 N81-30499
Agricultural water demand prediction using remote sensing technology for Georgia resource management
[PB81-184137] p0207 N81-30508
Satellite monitoring of snow extent and condition in agricultural, transitional, and forested land cover areas
[PB81-188625] p0254 N81-30509
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions
[E81-10081] p0209 N81-33543
Evaluation of LANDSAT data analysis for forest survey --- northeastern aspen-birch survey unit in Minnesota - Carlton County
[E81-10175] p0210 N81-33561

FRAME PHOTOGRAPHY
Analysis of the geometry of a frame photograph p0221 A81-42554

FRANCE
Interpretation techniques applied to mixed terrains p0218 A81-49788

FRESH WATER
Landsat hydrobiological classification for an inland fresh water marsh within Everglades National Park p0249 A81-43238
Freshwater ice thickness observations using passive microwave sensors p0254 A81-49968

FROST
The application of thermography for locating potential frost pockets in forest cutovers p0204 A81-49789

FROST DAMAGE
The application of thermography for locating potential frost pockets in forest cutovers p0204 A81-49789

G

GAMMA RAY SPECTRA
Methods development and applications evaluations of NURE aerial reconnaissance survey data for uranium resource evaluation: Beeville/Bay City and Crystal City quadrangles, Texas
[GJBX-69(81)] p0228 N81-30502
Airborne gamma-ray spectrometer and magnetometer survey
[DE81-027157] p0229 N81-32592
Airborne gamma-ray spectrometer and magnetometer survey. Canyon City quadrangle (Oregon), volume 2
[DE81-028682] p0229 N81-33584
Airborne gamma-ray spectrometer and magnetometer survey, Salem quadrangle (Oregon), volume 2
[DE81-028681] p0229 N81-33585

GARP ATLANTIC TROPICAL EXPERIMENT
Insights into errors of SMS-inferred GATE convective rainfall p0243 A81-42095

GEOBOTANY
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions
[E81-10081] p0209 N81-33543

GEOCHEMISTRY
Mineralogical, optical, and geochemical properties of John H. Kerr Reservoir sediment samples for AgRISTARS pollution research
[E81-10155] p0229 N81-33548

GEODESY
Differential Doppler experiment /DIDEX/ for geodetic applications p0221 A81-47938

GEODETIC SURVEYS
Measurement of lengths, angles, and areas on the earth's spheroid p0221 A81-42846
Optimization of Doppler measurements in the satellite network of Eastern Europe p0221 A81-48678
A 'meteorological' method for calculating vertical refraction p0221 A81-48679
Terrain profiling from Seasat altimetry
[NASA-CR-156878] p0222 N81-31604
Position measurements in Colombia by means of satellite observations p0222 N81-33522
Military geodesy and geospace science, unit one
[AD-A104038] p0222 N81-33581

GEODYNAMICS
NASA selects scientific investigations for Earth dynamics studies
[NASA-NEWS-RELEASE-81-129] p0228 N81-29143

GEOLOGICAL FAULTS
The use of imagery of the earth to study the structure of degassing zones within oil and gas basins p0225 A81-42276
Concerning the hydrogeological significance of faults on platform regions, as revealed by space imagery p0225 A81-42277
Ore-controlling space geological objects and their assessment techniques applied to mineral prediction
[IAF PAPER 81-107] p0227 A81-47353
The use of satellite imagery for studying the structural features of the Caspian oil and gas region p0227 A81-48684

GEOLOGICAL SURVEYS
Tiwi geothermal project - The Philippines p0225 A81-41908
An introduction to satellite hydrology p0244 A81-43184
U.S. geological survey application of satellite telemetry for the support of hydrologic data collection p0258 A81-43189
Landsat data for locating shallow glacial aquifers in eastern South Dakota p0226 A81-43228
Ground water exploration programs in Africa p0226 A81-43230
Aerial thermal survey in the study of earth resources --- Russian book p0277 A81-43981
Application of digital terrain data to quantify and reduce the topographic effect on Landsat data p0259 A81-45433
Lineament mapping in northern Sweden from Landsat images using orthogonal image transforms p0226 A81-46039
The informational estimation of the effectiveness of using satellite imagery in hydrogeological research p0227 A81-48683
Geological and terrain analysis of the Annapolis County region of Nova Scotia - An application of digital Landsat, radar and colour infrared data p0227 A81-49802
Conceptual design of an automated mapping satellite System (MAPSAT)
[PB81-185555] p0264 N81-29522
Methods development and applications evaluations of NURE aerial reconnaissance survey data for uranium resource evaluation: Beeville/Bay City and Crystal City quadrangles, Texas
[GJBX-69(81)] p0228 N81-30502
Atmospheric correction to LANDSAT data for limonite discrimination p0228 N81-31594
Remote sensing for engineering site selection
[AD-A102810] p0219 N81-32586

GEOMAGNETISM
Magnetic space-based field measurements
[AAS PAPER 81-077] p0272 A81-46241
Early results from Magsat --- studies of near-earth magnetic fields p0274 A81-48945
Geomagnetic field mapping from a satellite: Spatial power spectra of the geomagnetic field at various satellite altitudes relative to natural noise sources and instrument noise
[PUBL-1810] p0275 N81-29480
Reduction and analysis of satellite magnetometer data p0275 N81-29482

Investigation of Antarctic crust and upper mantle using Magsat and other geophysical data
[E81-10113] p0222 N81-32574

GEOMETRIC RECTIFICATION (IMAGERY)

A rectification technique for digital orthophoto production p0257 A81-41057

Correlation techniques and devices --- for photogrammetry p0258 A81-43531

Automation in photogrammetry p0258 A81-43532

A radar image time series p0228 A81-45430

Application of digital terrain data to quantify and reduce the topographic effect on Landsat data
p0259 A81-45433

Geometric correction of scanner images of the earth's surface p0261 A81-48694

Integration and comparison of SAR and MSS data for potato crop area estimation p0203 A81-49766

Geometric accuracy of Landsat images processed by NASDA p0263 A81-49818

Development of alternative data analysis techniques for improving the accuracy and specificity of natural resource inventories made with remote sensing data
p0266 N81-33551

An evaluation of MSS P-format data registration
[E81-10171] p0267 N81-33557

GEOMETRICAL OPTICS

Evaluation of the effect of sea-ice roughness on the microwave emission of the ice p0231 A81-41490

GEOMORPHOLOGY

An examination of fluvial morphological characteristics of western Amazon streams from Apollo-Soyuz photographs p0247 A81-43212

Landsat interpretation of prairie lakes and wetlands of eastern South Dakota p0249 A81-43240

Interactive processing of Landsat image for morphopedological studies p0259 A81-46043

Geomorphic mapping from Landsat-3 Return Beam Vidicon /RBV/ imagery p0228 A81-46194

GEOPHYSICS

Main tasks and methods of operational planning of experiments concerning the observations of the earth from space p0277 A81-42288

GEORGIA

Microwave radiometer measurement of tidally induced salinity changes off the Georgia coast p0232 A81-42067

Suburban soil loss and runoff simulation assisted by interpretation of large scale aerial photography
p0253 A81-48941

Agricultural water demand prediction using remote sensing technology for Georgia resource management
[PB81-184137] p0207 N81-30508

GEOS 3 SATELLITE

Calibration validation for the GEOS 3 altimeter
p0270 A81-42671

GEOTHERMAL RESOURCES

Tiwi geothermal project - The Philippines
p0225 A81-41908

Satellite observations of a geothermal submarine spring off Florida west coast p0233 A81-43248

Seasat satellite investigation of the structure of western Nebraska and its application to the evaluation of geothermal resources
[LA-UR-81-1454] p0223 N81-30505

GLACIAL DRIFT

Hydrogeology of glacial deposits from aerial photographs p0252 A81-43548

GLACIERS

Satellite Image Atlas of the earth's glaciers
p0246 A81-43202

Potentials of mapping buried glacier ice with Landsat thermal imagery p0246 A81-43204

Geological and terrain analysis of the Annapolis County region of Nova Scotia - An application of digital Landsat, radar and colour infrared data p0227 A81-49802

GLACIOLOGY

The European SAR-Project Convair 580
p0273 A81-46679

GLOBAL ATMOSPHERIC RESEARCH PROGRAM

Remote sounding of atmosphere and ocean for climate research /Appleton Lecture/ p0236 A81-47099

GOES SATELLITES

Characteristics, of TIROS, GOES, DMSP and LANDSAT systems
[E81-10192] p0263 N81-29506

GOVERNMENT/INDUSTRY RELATIONS

Space Benefits. The secondary application of aerospace technology in other sectors of the economy
[NASA-CR-164733] p0279 N81-32086

An industrial perspective of the LANDSAT opportunity
p0279 N81-32585

GRAINS (FOOD)

Procedure M - A framework for stratified area estimation --- in multispectral scanner data processing
p0201 A81-46036

The discrimination of cereal crops and legumes using reflectance data in the Landsat bandpasses
p0204 A81-49794

A temporal/spectral analysis of small grain crops and confusion crops --- North Dakota
[E81-10167] p0205 N81-28498

The multicategory case of the sequential Bayesian pixel selection and estimation procedure
[E81-10182] p0263 N81-29498

A description of the reformatted spring small grains labeling procedure used in test 2, part 2 of the US/Canada wheat and barley exploratory experiment
[E81-10206] p0207 N81-31597

Measurement of soil moisture trends with airborne scatterometers --- Texas
[E81-10088] p0209 N81-33545

AgRISTARS: Foreign commodity production forecasting. Program review presentation to level 1, Interagency Coordination Committee
[E81-10168] p0209 N81-33555

Australian transition year special studies
[E81-10179] p0210 N81-33565

GRASSLANDS

Evaluation of the possibility of using spectral-band and multispectral aerial photographs for the large-scale survey of natural pastures p0197 A81-41487

Remote sensing and mapping of pastures
p0213 A81-42281

GRAVIMETRY

Gravimetric studies of the earth's crust in the oceans --- Russian book p0221 A81-43524

Evaluation of gravimetric ground truth soil moisture data collected for the agricultural soil moisture experiment, 1978 Colby, Kansas, aircraft mission
[E81-10114] p0205 N81-29494

GRAVITATIONAL FIELDS

Satellite To Satellite Doppler Tracking (SSDT) for mapping of the Earth's gravity field
[NASA-CR-164722] p0223 N81-31601

GRAVITY ANOMALIES

Gravimetric studies of the earth's crust in the oceans --- Russian book p0221 A81-43524

Differential Doppler experiment /DIDEX/ for geodetic applications p0221 A81-47938

GRAVITY WAVES

The structure of short gravity waves on the ocean surface p0234 A81-46105

Refraction of coastal ocean waves p0235 A81-46113

GRAVSAT SATELLITE

Future plans for NASA's Oceanic Processes Program
p0231 A81-41997

GREAT BRITAIN

Satellite observations of England and north-western Europe p0217 A81-49174

GREAT LAKES (NORTH AMERICA)

Airborne microwave radiometer remote sensing of lake ice p0253 A81-48554

GREAT PLAINS CORRIDOR (NORTH AMERICA)

Determination of moisture from NOAA polar orbiting satellite sounding radiances p0243 A81-41158

Analysis of US spring wheat and spring barley periodic ground truth
[E81-10203] p0208 N81-32576

Crop phenology and LANDSAT-based irrigated lands inventory in the high plains: Appendices
[E81-10172] p0210 N81-33558

Crop phenology and LANDSAT-based irrigated lands inventory in the high plains
[E81-10173] p0210 N81-33559

GREAT SALT LAKE (UT)

Satellite detection of seiches in Great Salt Lake, Utah
p0243 A81-42126

A note on indirect detection of seiches in Great Salt Lake, Utah, by NOAA and Landsat satellite imagery
p0247 A81-43218

Mapping the Great Salt Lake shoreline and associated waterfowl habitat from Landsat data p0252 A81-43742

GREENHOUSE EFFECT

Basic problems of the physics and chemistry of contemporary changes of climate p0216 A81-47002

GREENLAND

Ice sheet altimetry
[NASA-CR-156877] p0240 N81-31605

GROUND TRUTH

Results of ground surveys, carried out in conjunction with satellite and aerial studies, of the state of winter wheat on the Kursk test polygon p0197 A81-41485

Relating ground level reflected radiance measurements in the Landsat MSS bandpasses to satellite altitudes
p0271 A81-43735

Alternative 'scale up' estimators for aerial surveys where both detection and classification errors exist
p0260 A81-46197

Evaluation of gravimetric ground truth soil moisture data collected for the agricultural soil moisture experiment, 1978 Colby, Kansas, aircraft mission
[E81-10114] p0205 N81-29494

Evaluation of large area crop estimation techniques using LANDSAT and ground-derived data --- Missouri
[E81-10200] p0206 N81-29511

Satellite measurements of tropospheric aerosols
[NASA-CR-3459] p0219 N81-31680

Field Study for Remote Sensing. An instructor's manual
[NASA-CP-2155] p0279 N81-32564

The workshop --- use and application of remotely sensed data p0280 N81-32566

Why surface-truth field study is needed in remote-sensing instruction p0280 N81-32567

LANDSAT C workshop field/laboratory exercises
p0280 N81-32571

Analysis of US spring wheat and spring barley periodic ground truth
[E81-10203] p0208 N81-32576

Interim catalog ground data summary, data acquisition year 1978
[E81-10132] p0209 N81-33546

A comparative study of the thematic mapper and LANDSAT spectral bands from field measurement data
[E81-10165] p0209 N81-33549

Lakewide monitoring of suspended solids using satellite data --- Lake Superior water reclamation
p0254 N81-33552

Evaluation of LANDSAT data analysis for forest survey --- northeastern aspen-birch survey unit in Minnesota - Carlton County
[E81-10175] p0210 N81-33561

As-built design specification of the automatic registration system for the cartographic technology laboratory
[E81-10176] p0267 N81-33562

Experiment plan: Row and roughness effects on dependence of active microwave measurements of soil moisture
[E81-10209] p0211 N81-33575

GROUND WATER

Survey of in-situ and remote sensing methods for soil moisture determination p0197 A81-43221

Soil moisture applications of the heat capacity mapping mission p0197 A81-43224

Ground water and satellites - An overview/introduction
p0248 A81-43226

Correlation of geologic structure inferred from computer enhanced Landsat imagery with underground water supplies in Arizona p0225 A81-43227

Ground water exploration programs in Africa
p0226 A81-43230

Ground water applications of the heat capacity mapping mission p0248 A81-43233

Satellite observations of a geothermal submarine spring off Florida west coast p0233 A81-43248

Hydrogeology of glacial deposits from aerial photographs p0252 A81-43548

Use of Seasat satellite radar imagery for the detection of standing water beneath forest vegetation
p0199 A81-43743

Landsat data as a basis for regional environmental assessment within the Columbia Plateau
p0218 A81-49798

The detection of groundwater discharges /springs/ using aerial thermography p0254 A81-49800

Synergistic relationships among remote-sensing and geophysical media: Geological and hydrological applications --- detecting near-surface ground water in Minnesota p0255 N81-33553

GULF OF MEXICO

Simulation modeling of estuarine ecosystems
p0243 A81-42229

Satellite observations of a geothermal submarine spring off Florida west coast p0233 A81-43248

Application of GOES visible-infrared data to quantifying mesoscale ocean surface temperatures
p0238 A81-47021

Gulf of Mexico satellite radar altimetry
[NASA-TM-73285] p0224 N81-33760

GULF STREAM

Method for estimation of ocean current velocity from satellite images p0231 A81-41350

Detection of the Gulf Stream p0235 A81-46115

A search for cold water rings p0235 A81-46116

Tracking of a warm water ring p0235 A81-46117

H

HABITATS

Using Landsat MSS data with soils information to identify wetland habitats p0249 A81-43236

From landforms to avian habitat - A look at topology
p0214 A81-43739

The application of remote sensing techniques for an ecological land survey of the snow goose colony at Cape Henrietta Maria, Hudson Bay p0204 A81-49791

Nationwide forestry applications program. Analysis of forest classification accuracy
[E81-10183] p0206 N81-29499

Environmental assessment of the Alaskan continental shelf: Reports of principal investigators. Volume 1: Reactors - birds, plankton, littoral, benthos
[PB81-196263] p0240 N81-30780

HAWAII

Comparison of laboratory reflectance spectra and LANDSAT multispectral images of Hawaiian lava flows
[E81-10061] p0266 N81-33541

HAZE

An analysis of haze effects on LANDSAT multispectral scanner data
[E81-10162] p0263 N81-29497

Some methods of multitemporal analysis of LANDSAT images resulting from a study on Venice Lagoon
[E81-10205] p0267 N81-33574

HEAT ISLANDS

Preliminary survey of HCMM satellite thermal imagery as applied to hydrospherics p0252 A81-43746

Satellite observations of England and north-western Europe p0217 A81-49174

HEAT SOURCES

Identification of subresolution high temperature sources using a thermal IR sensor p0273 A81-46401

HIGH RESOLUTION
A differential inversion method for high resolution atmospheric remote sensing p0215 A81-45862
HIGHWAYS
The use of CIR and airborne multispectral scanner techniques for wetland soils mapping of highway corridors p0215 A81-46044
HISTOGRAMS
Large-area histograms from Meteosat images p0260 A81-46917
Histogram estimation for multiple-detector sensors p0262 A81-49812
HONG KONG
Land use mapping of Hong Kong from Landsat images - An evaluation p0215 A81-45434
HURRICANES
Hurricane 'Flossie' /September 1978/ observed in the north Atlantic, by the Meteosat satellite p0213 A81-41061
A satellite derived technique for estimating rainfall from thunderstorms and hurricanes p0244 A81-43191
Atlantic hurricane season of 1980 p0238 A81-49649
HYDROELECTRICITY
Operational use of satellite data for snow inventory and runoff forecast p0246 A81-43210
HYDROGEOLOGY
Concerning the hydrogeological significance of faults on platform regions, as revealed by space imagery p0225 A81-42277
Fitoexomorphogenic analysis of geological environment changes in the South Aral Sea, based on aerial and space imagery p0225 A81-42279
Optical and digital analyses of Landsat data depicting hydrogeological features of the Daryacheh-Ye-Namak area, Iran p0225 A81-43215
Correlation of geologic structure inferred from computer enhanced Landsat imagery with underground water supplies in Arizona p0225 A81-43227
Landsat data for locating shallow glacial aquifers in eastern South Dakota p0226 A81-43228
Hydrogeologic interpretations of Landsat imagery in arid zones of South and West Africa p0248 A81-43229
Ground water exploration programs in Africa p0226 A81-43230
Observations on Lake Ontario basin hydrogeology from optical enhancements of Landsat imagery p0248 A81-43231
Satellite observations of a geothermal submarine spring off Florida west coast p0233 A81-43248
Hydrogeology of glacial deposits from aerial photographs p0252 A81-43548
Aerial thermal survey in the study of earth resources --- Russian book p0277 A81-43981
The informational estimation of the effectiveness of using satellite imagery in hydrogeological research p0227 A81-48683
A study of Minnesota land and water resources using remote sensing, Volume 14
[E81-10166] p0254 N81-33550
HYDROGRAPHY
The detection of groundwater discharges /springs/ using aerial thermography p0254 A81-49800
Interpretation of hydrographic features seen in the waters off Cape Cod
[AD-A102343] p0240 N81-31803
Derivation of shallow ocean bottom reflectance values from color aerial photography
[AD-A101105] p0241 N81-33763
HYDROLOGY
Environmental satellites p0277 A81-42231
Satellite hydrology. Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979 p0243 A81-43176
Remote sensing in hydrology - A challenge to scientists p0243 A81-43177
NASA water resources/hydrology remote sensing program in the 1980's p0244 A81-43179
Corps of Engineers utilization of satellites for hydrologic purposes p0244 A81-43180
Agricultures's needs related to satellite hydrology p0197 A81-43181
A review of Canada's present and future remote sensing activities relating to hydrology p0244 A81-43182
Satellite versus conventional methods in hydrology p0244 A81-43183
An introduction to satellite hydrology p0244 A81-43184
Satellite telemetry of hydrologic data in California p0244 A81-43187
U.S. geological survey application of satellite telemetry for the support of hydrologic data collection p0258 A81-43189
Utilizing GOES imagery to determine convective storm characteristics in data deficient regions p0245 A81-43192
Modeling the terrestrial hydrology for the global atmosphere - The future role of satellite data p0245 A81-43197
A statistical approach to rainfall estimation using satellite data p0245 A81-43198
Roles of satellites in hydrology p0245 A81-43199
The use of radar imagery for surface water investigations p0247 A81-43211
An examination of fluvial morphological characteristics of western Amazon streams from Apollo-Soyuz photographs p0247 A81-43212
Hydrologic land use classification using Landsat p0247 A81-43213
Improving stream flow estimates through the use of Landsat p0247 A81-43216
A note on indirect detection of seiches in Great Salt Lake, Utah, by NOAA and Landsat satellite imagery p0247 A81-43218
Assessing the Red River of the North 1978 flooding from NOAA satellite data p0248 A81-43219
A preliminary analysis of SAR mapping of the Manitoba flood, May 1979 p0248 A81-43220
Survey of in-situ and remote sensing methods for soil moisture determination p0197 A81-43221
Characteristics of microwave emission of significance to satellite remote sensing of soil water p0258 A81-43222
Soil moisture applications of the heat capacity mapping mission p0197 A81-43224
Requirements of space-borne microwave radiometers for detecting soil moisture contents p0270 A81-43225
Ground water and satellites - An overview/introduction p0248 A81-43226
Applications of aerospace data for detection of submarine springs in Jamaica p0226 A81-43232
Landsat hydrobiological classification for an inland fresh water marsh within Everglades National Park p0249 A81-43238
A technique for improved assessment of flow resistance characteristics of natural wetlands using Landsat data p0249 A81-43241
Using Landsat imagery to study the Okavango Swamp, Botswana p0249 A81-43242
Assessment and classifications of selected Illinois lakes through the application of space technology p0250 A81-43255
A multistage mapping approach for an irrigated croplands inventory p0198 A81-43262
Remote sensing of bank erosion along the Missouri River, South Dakota p0213 A81-43263
Mapping irrigated lands in Western Kansas from Landsat p0198 A81-43265
Multisensor analysis of hydrologic features with emphasis on the Seasat SAR p0251 A81-43544
Use of Seasat satellite radar imagery for the detection of standing water beneath forest vegetation p0199 A81-43743
Aerial thermal survey in the study of earth resources --- Russian book p0277 A81-43981
The European SAR-Project Convair 580 p0273 A81-46679
Infrared imagery for studying the Kara-Bogaz-Gol Bay p0236 A81-48681
An analysis of the data of synchronous measurements from the Meteor satellite and ships at the eastern coast of the Caspian Sea p0237 A81-48687
Remote sensing in development --- for developing nations p0279 A81-48936
Landsat - What is operational in water resources p0253 A81-49757
Use of Landsat images in the monitoring and study of the LG 2 reservoir during the filling period p0254 A81-49797
Landsat data as a basis for regional environmental assessment within the Columbia Plateau p0218 A81-49798
Agricultural water demand prediction using remote sensing technology for Georgia resource management
[PB81-184137] p0207 N81-30508
HYDROLOGY MODELS
Modeling the terrestrial hydrology for the global atmosphere - The future role of satellite data p0245 A81-43197
A statistical approach to rainfall estimation using satellite data p0245 A81-43198
Application of snow covered area to runoff forecasting, in the Sierra Nevada, California p0245 A81-43201
Prediction of water yield using satellite imagery and a snowmelt simulation model p0246 A81-43205
Evaluation of remote sensing data for input into Hydrological Simulation Program-FORTRAN (HSPF) --- modeling the Occoquan watershed in Virginia using LANDSAT imagery for parameter estimation
[PB81-209561] p0255 N81-33593
HYDROMETEOROLOGY
The use of satellite data in predicting spring flow in the basins of the upper Ob' and upper Enisei p0243 A81-41723
Satellite applications in river and flood forecasting p0243 A81-43178
Monitoring Canada's water resources in remote regions by satellite telemetry p0244 A81-43188
Use of satellite pictures for agriculture p0205 N81-28120

I

ICE ENVIRONMENTS
Optimizing imaging radar parameters for ice reconnaissance p0239 A81-49779
ICE MAPPING
Sea ice detection using enhanced infrared satellite data p0232 A81-42131
Satellite Image Atlas of the earth's glaciers p0246 A81-43202
Correlation function studies for snow and ice p0260 A81-46378
The use of satellite imagery as an aid to the Canadian Coast Guard ice operations p0238 A81-49758
Airborne impulse radar sounding of sea ice p0238 A81-49771
The Lake Melville/Labrador offshore synthetic aperture radar study - Winter 1979 p0238 A81-49772
Single and multiple parameter microwave signatures of sea ice p0238 A81-49774
Radar detection of sea-ice ridges and icebergs in frozen oceans at incidence angles from 0 deg to 90 deg p0238 A81-49775
Digital image analysis of SAR imagery for the detection of icebergs p0239 A81-49777
Application of synthetic aperture radar data to snow cover monitoring p0253 A81-49778
Freshwater ice thickness observations using passive microwave sensors p0254 A81-49988
Ice sheet altimetry
[NASA-CR-156877] p0240 N81-31605
Categorization of Northern Green Bay ice cover using LANDSAT 1 digital data: A case study
[PB81-200438] p0265 N81-32602
Comparative analysis of sea ice features using Side-Looking Airborne Radar (SLAR) and LANDSAT imagery --- Beaufort Sea and Bering Sea
[E81-10044] p0241 N81-33539
ICE REPORTING
Remote sensing in hydrology - A challenge to scientists p0243 A81-43177
Iceberg detectability problems using SAR and SLAR systems p0232 A81-43206
The first ESA remote sensing satellite /ERS/ - The programme and the system
[IAF PAPER 81-90] p0236 A81-47344
Operational use of satellite imagery in the Canadian ice program p0238 A81-49754
Utilisation and benefits of SLAR in operational ice data acquisition p0253 A81-49761
The airborne SAR project - Conclusions and applications p0275 A81-49765
Experimental use of real time SAR imagery in support of oil exploration in the Beaufort Sea p0227 A81-49767
ICEBERGS
Iceberg detectability problems using SAR and SLAR systems p0232 A81-43206
Radar detection of sea-ice ridges and icebergs in frozen oceans at incidence angles from 0 deg to 90 deg p0238 A81-49775
Digital image analysis of SAR imagery for the detection of icebergs p0239 A81-49777
ICELAND
Satellite Image Atlas of the earth's glaciers p0246 A81-43202
IDAHO
Change vector analysis - An approach for detecting forest changes with Landsat p0202 A81-46056
IGNEOUS ROCKS
Identifying igneous rocks in an arid environment on aerial photography by photo tone and photo texture
[AD-A102809] p0228 N81-32587
ILLINOIS
Users manual for the US baseline corn and soybean segment classification procedure
[E81-10190] p0206 N81-29504
ILLUMINATING
Investigation of illumination in the image plane of the receiving optical system for the aerial or spaceborne photography of the world ocean p0232 A81-42553
IMAGE CONTRAST
Accuracy of transmission of spectral contrasts in multispectral aerial photography, with application to problems of object recognition p0257 A81-41479
IMAGE CORRELATORS
Correlation techniques and devices --- for photogrammetry p0258 A81-43531
Image correlation algorithms p0261 A81-48473
IMAGE ENHANCEMENT
Machine method for the equalization of average phototone in an aerial photograph field p0257 A81-41482
Sea ice detection using enhanced infrared satellite data p0232 A81-42131
Flood applications of satellite imagery p0247 A81-43217
Correlation of geologic structure inferred from computer enhanced Landsat imagery with underground water supplies in Arizona p0225 A81-43227
Observations on Lake Ontario basin hydrogeology from optical enhancements of Landsat imagery p0248 A81-43231
Satellite detection of oil on the marine surface p0233 A81-43251
Using enhanced Landsat images for calibrating real time estuarine water quality models p0250 A81-43252
Lake Ontario dynamics and water quality observations using thematically enhanced Landsat data p0251 A81-43257
Automation in photogrammetry p0258 A81-43532
Operational use of satellite imagery in the Canadian ice program p0238 A81-49754

Principal components enhancements versus classifications of Landsat images for forestry applications p0203 A81-49782

Interpretation techniques applied to mixed terrains p0218 A81-49788

Digital enhancements for vegetation mapping in a subarctic environment p0262 A81-49793

Current resource mapping and environmental monitoring applications using Landsat MSS data in Scotland p0218 A81-49806

Visual enhancement of images of natural resources: Applications in geology
[E81-10181] p0228 N81-32575

IMAGE PROCESSING

Multispectral texture analysis p0257 A81-41055

A rectification technique for digital orthophoto production p0257 A81-41057

Experience with image combination in multispectral aerial photography p0257 A81-41481

Machine method for the equalization of average phototone in an aerial photograph field p0257 A81-41482

Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects p0197 A81-41489

Geological interpretation in an interactive mode in automated systems of digital image processing p0225 A81-42289

Optical and digital analyses of Landsat data depicting hydrogeological features of the Daryacheh-Ye-Namak area, Iran p0225 A81-43215

Ground water exploration programs in Africa p0226 A81-43230

Digital analysis of Landsat MSS data and application for coastal marine environment p0233 A81-43247

Application of digital image processing techniques and information systems to water quality monitoring of Lake Tahoe p0251 A81-43258

Selected irrigation acreage estimates in northern Florida from Landsat data p0198 A81-43264

Skylab in retrospect p0277 A81-43535

A capture-recapture approach for estimation of detection probabilities in aerial surveys p0258 A81-43546

Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers p0198 A81-43727

Urban area update procedures using Landsat data p0214 A81-43733

Training site statistics from Landsat and Seasat satellite imagery registered to a common map base p0258 A81-43734

Manual versus digital Landsat analysis for modeling river flooding p0252 A81-43745

Southern Chesapeake Bay circulation and suspended sediment transport analyzed using Landsat imagery p0252 A81-43747

Texture analysis and urban land use classification p0214 A81-44684

A radar image time series p0226 A81-45430

Procedures for change detection using Landsat digital data p0215 A81-45437

Earth applications orbit analysis for a shuttle-mounted Multispectral Mapper
[AAS PAPER 81-182] p0271 A81-45836

Parallel processing implementations of a contextual classifier for multispectral remote sensing data p0272 A81-46028

The Lulea Image Processing System /LIPS/ - A versatile approach to earth resources data processing p0272 A81-46030

An assessment of Landsat data acquisition history on identification and area estimation of corn and soybeans p0200 A81-46032

Crop classification with a Landsat/radar sensor combination p0200 A81-46033

Comparison of Landsat-2 and field spectrometer reflectance signatures of south Texas rangeland plant communities p0201 A81-46034

Procedure M - A framework for stratified area estimation --- in multispectral scanner data processing p0201 A81-46036

Radar image preprocessing --- of SEASAT-A SAR data p0272 A81-46038

Lineament mapping in northern Sweden from Landsat images using orthogonal image transforms p0226 A81-46039

Maximum likelihood estimation of label imperfection probabilities and its use in the identification of mislabeled patterns --- with application to Landsat MSS data processing p0259 A81-46040

Context distribution estimation for contextual classification of multispectral image data p0259 A81-46041

Stratification of Landsat data by uniformity productivity of soils p0259 A81-46042

Interactive processing of Landsat image for morphopedological studies p0259 A81-46043

Inventory estimation on the massively parallel processor --- from satellite based images p0259 A81-46052

Bulk processing techniques for very large areas - Landsat classification of California p0201 A81-46054

Procedure 1 and forestland classification using Landsat data p0201 A81-46055

SAR ocean imaging mechanisms p0234 A81-46107

Application of delta modulation in on-board and ground video data processing systems for the purposes of remote sensing
[IAF PAPER 81-102] p0260 A81-47351

Image correlation algorithms p0261 A81-48473

Radar-optical-topographic transformations for scene content analysis p0261 A81-48552

Complex processing of satellite images and the geological interpretation p0227 A81-48690

Selection of reference zones for the automatic coordinate control of space images p0261 A81-48693

Geometric correction of scanner images of the earth's surface p0261 A81-48694

Derivation of formulas for the correlation of coordinate points of different-scale photographs and quasi-photographs p0261 A81-48772

The influence of the accuracy of determining the elements of the external orientation of a stereopair on the processing of aerial photographs on the basis of adjusting elements p0261 A81-48773

ICAP - An Interactive Cluster Analysis Procedure for analyzing remotely sensed data p0261 A81-49345

SAR processing of partially coherent and sinusoidally dynamic ocean waves p0239 A81-49776

Digital image analysis of SAR imagery for the detection of icebergs p0239 A81-49777

Landsat data as a basis for regional environmental assessment within the Columbia Plateau p0218 A81-49798

Generation and use of digital elevation data for large areas p0221 A81-49811

Histogram estimation for multiple-detector sensors p0262 A81-49812

Comparative experimental study on the use of original and compressed multispectral Landsat data of the Bayuda desert p0262 A81-49813

Acquisition and preprocessing of images collected by future European Space Agency satellites p0263 A81-49814

Evaluation of Thematic Mapper bands - A first step in feature selection p0205 A81-49815

Geometric accuracy of Landsat images processed by NASDA p0263 A81-49818

Estimation of proportions in mixed pixels through their region characterization
[E81-10199] p0264 N81-29510

Evaluation of large area crop estimation techniques using LANDSAT and ground-derived data --- Missouri
[E81-10200] p0206 N81-29511

The sensor image simulator
[AD-A101172] p0275 N81-29512

Interactive digital image processing for terrain data extraction
[AD-A101321] p0264 N81-30499

Knowledge-based image analysis
[AD-A101319] p0264 N81-30852

A technique for line extraction from LANDSAT multi-spectral scanner satellite data with some applications of the technique
[RAE-TR-81010] p0265 N81-31613

Visual enhancement of images of natural resources: Applications in geology
[E81-10181] p0228 N81-32575

Partially automated object extraction from aerial photographs and land maps p0266 N81-33528

The development of a remote sensing applications program for Vermont
[E81-10149] p0266 N81-33547

A study of Minnesota land and water resources using remote sensing, Volume 14
[E81-10166] p0254 N81-33550

Development of alternative data analysis techniques for improving the accuracy and specificity of natural resource inventories made with remote sensing data p0266 N81-33551

An evaluation of MSS P-format data registration
[E81-10171] p0267 N81-33557

Maximum likelihood labeling
[E81-10177] p0267 N81-33563

Some methods of multitemporal analysis of LANDSAT images resulting from a study on Venice Lagoon
[E81-10205] p0267 N81-33574

Topographic slope correction for analysis of thermal infrared images
[PB81-211781] p0224 N81-33589

IMAGE RECONSTRUCTION

Geometric accuracy of Landsat images processed by NASDA p0263 A81-49818

Fourier modulus image construction
[AD-A101728] p0264 N81-30723

IMAGE RESOLUTION

A measure of reliability for classification of earth satellite data p0257 A81-42631

Image quality for SPOT satellite - Specifications and budget
[IAF PAPER 81-104] p0261 A81-47352

An analysis of haze effects on LANDSAT multispectral scanner data
[E81-10162] p0263 N81-29487

A study of the effects of the atmosphere on thematic mapper observations
[E81-10066] p0276 N81-33540

IMAGING PROCESSING

Space based topographic mapping experiment using Seasat synthetic aperture radar and LANDSAT 3 return beam vidicon imagery
[NASA-CR-164875] p0223 N81-30498

IMAGING TECHNIQUES

A review of Canada's present and future remote sensing activities relating to hydrology p0244 A81-43182

Use of imaging radar for geology and archeology p0226 A81-43730

Simulation of orbital image-sensor geometry p0260 A81-46192

Radiometry with nighttime DMSP images in digital form --- satellite earth observations p0260 A81-46402

Manual versus digital Landsat analysis for delineating river flooding p0252 A81-46405

Applicability of airborne SAR data to geological mapping p0227 A81-49769

Airborne estimation of water quality parameters in Lake Ontario p0254 A81-49796

IMPERIAL VALLEY (CA)

Terrain profiling from Seasat altimetry
[NASA-CR-156878] p0222 N81-31604

IMPROVED TIROS OPERATIONAL SATELLITES

Characteristics, of TIROS, GOES, DMSP and LANDSAT systems
[E81-10192] p0263 N81-29506

INCOHERENT SCATTERING

Coherent and incoherent radar scattering from rough surfaces and vegetated areas --- conferences
[ESA-SP-166] p0208 N81-33339

Introduction to the workshop --- on coherent and incoherent radar scattering from rough surfaces and vegetated areas p0276 N81-33340

INDIA

A case study of soil erosion detection by digital analysis of the remotely sensed multispectral Landsat scanner data of a semi-arid land in southern India p0201 A81-46050

INDIANA

Using Landsat MSS data with soils information to identify wetland habitats p0249 A81-43236

Users manual for the US baseline corn and soybean segment classification procedure
[E81-10190] p0206 N81-29504

INDUSTRIAL PLANTS

Identification of subresolution high temperature sources using a thermal IR sensor p0273 A81-46401

INDUSTRIAL WASTES

Drift and dispersion studies of ocean-dumped waste using Landsat imagery and current drogues p0233 A81-43539

INFESTATION

Mountain pine beetle damage surveys with high-altitude panoramic photography p0199 A81-43732

The development of a remote sensing applications program for Vermont
[E81-10149] p0266 N81-33547

INFORMATION DISSEMINATION

Landsat technology transfer to the private and public sectors through community colleges and other locally available institutions p0277 A81-43750

INFORMATION RETRIEVAL

Computer program documentation user information for the RSO-tape print prugram (RSOPRNT)
[E81-10198] p0264 N81-29509

INFORMATION SYSTEMS

Application of digital image processing techniques and information systems to water quality monitoring of Lake Tahoe p0251 A81-43258

Physical and technical foundations for the development of subsatellite systems for the exploration of natural earth resources
[IAF PAPER 81-101] p0278 A81-47350

Requirements on the data/information system --- of satellite systems for earth resources observation p0278 A81-48527

Reports on cartography and geodesy, series 1: Original reports, Number 81
[ISSN-0469-4236] p0222 N81-33527

The development of a remote sensing applications program for Vermont
[E81-10149] p0266 N81-33547

Development of alternative data analysis techniques for improving the accuracy and specificity of natural resource inventories made with remote sensing data p0266 N81-33551

INFORMATION THEORY

Concerning the reliability estimation of information obtained from several sources in earth survey tasks p0270 A81-42286

INFRARED IMAGERY

Sea ice detection using enhanced infrared satellite data p0232 A81-42131

Utilizing GOES imagery to determine convective storm characteristics in data deficient regions p0245 A81-43192

Rain estimation over several areas of the globe using satellite imagery p0245 A81-43193

Infrared-temperature variability in a large agricultural field p0200 A81-45432

Identification of subresolution high temperature sources using a thermal IR sensor p0273 A81-46401

Microdensitometry to identify saline rangelands on 70-mm color-infrared aerial film p0202 A81-46406

The application of thermography for locating potential frost pockets in forest cutovers p0204 A81-49789

Soil moisture inferences from thermal infrared measurements of vegetation temperatures
[E81-10184] p0206 N81-29500
Topographic slope correction for analysis of thermal infrared images
[PB81-211781] p0224 N81-33589

INFRARED PHOTOGRAPHY
Experience with the determination of optical image distortions of landscape elements on IR aerial photographs p0257 A81-41430
Applications of aerospace data for detection of submarine springs in Jamaica p0226 A81-43232
Wetland mapping from digitized aerial photography p0252 A81-43549
The use of CIR and airborne multispectral scanner techniques for wetland soils mapping of highway corridors p0215 A81-46044
Mapping alpine soils using color positive and color infrared photographs p0252 A81-46045
Methods of editing cloud and atmospheric layer affected pixels from satellite data --- in south Texas test area
[E81-10169] p0266 N81-33556
Quantification of non-point source sedimentation through densitometric analysis of color infrared aerial photography
[PB81-209157] p0255 N81-33599

INFRARED RADIATION
Satellite identification of surface radiant temperature fields of subpixel resolution
[PB81-184038] p0265 N81-31615
Satellite measurements of atmospheric aerosols
[AD-A103493] p0220 N81-33720

INFRARED SPECTROMETERS
A differential inversion method for high resolution atmospheric remote sensing p0215 A81-45862
First results of the Intercosmos satellite IK-21
[IAF PAPER 81-214] p0274 A81-47409

INFRARED SPECTROSCOPY
Experimental investigation of the physical fundamentals for remote sensing of soil and vegetation moisture by active infrared reflectance spectroscopy using CO2 laser technique
[BMFT-FB-W-80-037] p0211 N81-33588

INLAND WATERS
Landsat data for regulatory permit monitoring p0247 A81-43214
Landsat hydrobiological classification for an inland fresh water marsh within Everglades National Park p0249 A81-43238

INLETS (TOPOGRAPHY)
Applications of Landsat imagery to a coastal inlet stability study p0250 A81-43249

INSTRUMENT PACKAGES
A radiometric model of an earth radiation budget radiometer optical system with diffuse-specular surfaces p0269 A81-41919

INTERCOSMOS SATELLITES
Program and instrumentation of the satellite experiment Bulgaria-1300 II
[IAF PAPER 81-91] p0273 A81-47345
New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300'
[IAF PAPER 81-212] p0273 A81-47407
First results of the Intercosmos satellite IK-21
[IAF PAPER 81-214] p0274 A81-47409

INTERFEROMETRY
Atmospheric nitric acid and chlorofluoromethane 11 from interferometric spectra obtained at the Observatoire du Pic du Midi
[AERONOMICA-ACTA-A-227-1980] p0219 N81-30656
Fourier modulus image construction
[AD-A101728] p0264 N81-30723

INTERNATIONAL LAW
International monitoring from space /Problems of international law/ --- Russian book p0279 A81-49468

IONOSPHERIC SOUNDING
ISS-b experimental results on global distributions of ionospheric parameters and thunderstorm activity p0215 A81-44862
New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300'
[IAF PAPER 81-212] p0273 A81-47407

IOWA
Users manual for the US baseline corn and soybean segment classification procedure
[E81-10190] p0206 N81-29504
Crop area estimation using ground-gathered and sampled LANDSAT data
[PB81-192783] p0207 N81-30507
Atmospheric nitric acid and chlorofluoromethane 11 from interferometric spectra obtained at the Observatoire du Pic du Midi
[AERONOMICA-ACTA-A-227-1980] p0219 N81-30656

IRAN
Optical and digital analyses of Landsat data depicting hydrogeological features of the Daryacheh-Ye-Namak area, Iran p0225 A81-43215

IRRADIANCE
Does the use of two radiometers correct for irradiance changes during measurements p0272 A81-46196
Investigation of multispectral remote sensing of snow cover using a solar radiation model p0262 A81-48804

IRRIGATION
Application of remote sensing for California irrigated lands assessment p0213 A81-43261
A multistage mapping approach for an irrigated croplands inventory p0198 A81-43262
Selected irrigation acreage estimates in northern Florida from Landsat data p0198 A81-43264
Mapping irrigated lands in Western Kansas from Landsat p0198 A81-43265
Mapping irrigated cropland on the High Plains using Landsat p0198 A81-43266
Remote sensing and land use planning p0218 A81-49792
Agricultural water demand prediction using remote sensing technology for Georgia resource management
[PB81-184137] p0207 N81-30508
Crop phenology and LANDSAT-based irrigated lands inventory in the high plains: Appendices
[E81-10172] p0210 N81-33558
Crop phenology and LANDSAT-based irrigated lands inventory in the high plains
[E81-10173] p0210 N81-33559

ITALY
European industrial space projects
[AAS PAPER 81-053] p0278 A81-46234
Use of elevation models for landform analysis by Seasat-SAR imagery
[IAF PAPER 81-98] p0260 A81-47349
Analysis of the November 23, 1980 earthquake as a design basis for satellite emergency communication
[IAF PAPER 81-269] p0216 A81-47433
Some methods of multitemporal analysis of LANDSAT images resulting from a study on Venice Lagoon
[E81-10205] p0267 N81-33574

J

JAMAICA
Applications of aerospace data for detection of submarine springs in Jamaica p0226 A81-43232

JAPAN
Digital analysis of Landsat MSS data and application for coastal marine environment p0233 A81-43247
A comparison of automatic classification algorithms for land use map by remotely sensed data p0215 A81-44701
Monitoring of snow covered area using satellite data
[IAF PAPER 81-114] p0253 A81-47356
Research on assessment of the recreational value of forests using Landsat digital data p0203 A81-49785

JAPANESE SPACE PROGRAM
Development of Marine Observation Satellite-1
[AAS PAPER 81-060] p0278 A81-46238

K

KANSAS
Mapping irrigated lands in Western Kansas from Landsat p0198 A81-43265
Look direction dependence of radar backscattering cross section for agricultural fields p0199 A81-43741
Crop classification with a Landsat/radar sensor combination p0200 A81-46033
Sampling Landsat classifications for crop area estimation p0202 A81-46404
Evaluation of gravimetric ground truth soil moisture data collected for the agricultural soil moisture experiment, 1978 Colby, Kansas, aircraft mission
[E81-10114] p0205 N81-29494
Atmospheric nitric acid and chlorofluoromethane 11 from interferometric spectra obtained at the Observatoire du Pic du Midi
[AERONOMICA-ACTA-A-227-1980] p0219 N81-30656

L

LABRADOR
Airborne impulse radar sounding of sea ice p0238 A81-49771
The Lake Melville/Labrador offshore synthetic aperture radar study - Winter 1979 p0238 A81-49772

LAGOONS
Some methods of multitemporal analysis of LANDSAT images resulting from a study on Venice Lagoon
[E81-10205] p0267 N81-33574

LAKE ICE
Airborne microwave radiometer remote sensing of lake ice p0253 A81-48554
Airborne impulse radar sounding of sea ice p0238 A81-49771
The Lake Melville/Labrador offshore synthetic aperture radar study - Winter 1979 p0238 A81-49772
Freshwater ice thickness observations using passive microwave sensors p0254 A81-49968

LAKE MICHIGAN
Thermal patterns of Lake Michigan and Lake Superior from satellite remote sensors and its uses p0250 A81-43256
Determination of beach sand parameters using remotely sensed aircraft reflectance data p0217 A81-49346

LAKE ONTARIO
Observations on Lake Ontario basin hydrogeology from optical enhancements of Landsat imagery p0248 A81-43231
Lake Ontario dynamics and water quality observations using thematically enhanced Landsat data p0251 A81-43257
Airborne estimation of water quality parameters in Lake Ontario p0254 A81-49796
A remote sensing technique to monitor Cladophora in the Great Lakes
[PB81-173841] p0254 N81-29520

LAKE SUPERIOR
Thermal patterns of Lake Michigan and Lake Superior from satellite remote sensors and its uses p0250 A81-43256
Lakewide monitoring of suspended solids using satellite data --- Lake Superior water reclamation p0254 N81-33552

LAKE TAHOE (CA-NV)
Application of digital image processing techniques and information systems to water quality monitoring of Lake Tahoe p0251 A81-43258
Photographic technology development project: Timber typing in the Tahoe Basin using high altitude panoramic photography
[NASA-CR-161082] p0208 N81-32578

LAKES
The use of radar imagery for surface water investigations p0247 A81-43211
Optical and digital analyses of Landsat data depicting hydrogeological features of the Daryacheh-Ye-Namak area, Iran p0225 A81-43215
Improvements in lake volume predictions using Landsat data p0248 A81-43237
Landsat interpretation of prairie lakes and wetlands of eastern South Dakota p0249 A81-43240
Assessment and classifications of selected Illinois lakes through the application of space technology p0250 A81-43255
Trophic state determination for shallow coastal lakes from Landsat imagery p0251 A81-43259

LAND ICE
Potentials of mapping buried glacier ice with Landsat thermal imagery p0246 A81-43204

LAND MANAGEMENT
European industrial space projects
[AAS PAPER 81-053] p0278 A81-46234
Development of alternative data analysis techniques for improving the accuracy and specificity of natural resource inventories made with remote sensing data p0266 N81-33551

LAND USE
Multispectral texture analysis p0257 A81-41055
Evaluation of the possibility of using spectral-band and multispectral aerial photographs for the large-scale survey of natural pastures p0197 A81-41487
Remote sensing and mapping of pastures p0213 A81-42281
Hydrologic land use classification using Landsat p0247 A81-43213
Improving stream flow estimates through the use of Landsat p0247 A81-43216
Application of remote sensing for California irrigated lands assessment p0213 A81-43261
Comparison of sampling procedures and data analysis for a land-use and land-cover map p0213 A81-43533
Mapping wetlands using orthophotoquads and 35-mm aerial photographs p0251 A81-43543
Urban area update procedures using Landsat data p0214 A81-43733
Training site statistics from Landsat and Seasat satellite imagery registered to a common map base p0258 A81-43734
Texture measurements from Seasat - SAR images for urban land use interpretation p0214 A81-43749
Texture analysis and urban land use classification p0214 A81-44684
A comparison of automatic classification algorithms for land use map by remotely sensed data p0215 A81-44701
Land use mapping of Hong Kong from Landsat images An evaluation p0215 A81-45434
The methodology of CIAT's land resource study of tropical America p0216 A81-46046
Bulk processing techniques for very large areas - Landsat classification of California p0201 A81-46054
Procedure 1 and forestland classification using Landsat data p0201 A81-46055
Change vector analysis - An approach for detecting forest changes with Landsat p0202 A81-46056
Analysis of landfills with historic airphotos p0216 A81-46407
A practical method for the verification of computer-processed Landsat data p0261 A81-48943
Satellite observations of England and north-western Europe p0217 A81-49174
Multistage remote sensing in exploratory ecodistrict land classification p0217 A81-49759
Present state of remote sensing development in Poland p0279 A81-49763
Interpreter evaluations of airborne radar imagery for ecological and land/use cover classification in southern Manitoba p0218 A81-49773
Land use/cover mapping for Halifax County - Remote sensing alternatives p0218 A81-49783
Interpretation techniques applied to mixed terrains p0218 A81-49788

Remote sensing and land use planning p0218 A81-49792
Landsat data as a basis for regional environmental assessment within the Columbia Plateau p0218 A81-49798
Thermal inertia mapping of some areas of Quebec based on aerial and HCMM satellite data p0204 A81-49799
Current resource mapping and environmental monitoring applications using Landsat MSS data in Scotland p0218 A81-49806
Evaluation of multiband, multitemporal, and transformed LANDSAT MSS data for land cover area estimation --- North Central Missouri
[E81-10161] p0219 N81-29496
Evaluation of large area crop estimation techniques using LANDSAT and ground-derived data --- Missouri
[E81-10200] p0206 N81-29511
Interactive digital image processing for terrain data extraction
[AD-A101321] p0264 N81-30499
Remote sensing for engineering site selection
[AD-A102810] p0219 N81-32586
The development of a remote sensing applications program for Vermont
[E81-10149] p0266 N81-33547
Evaluation of LANDSAT data analysis for forest survey --- northeastern aspen-birch survey unit in Minnesota - Carlton County
[E81-10175] p0210 N81-33561

LANDFILLS
Analysis of landfills with historic airphotos p0216 A81-46407

LANDSAT D
Efficiency criteria of space systems for studying the earth's natural resources p0277 A81-42287
A simulation of Thematic Mapper performance in an agricultural application p0204 A81-49810
Evaluation of Thematic Mapper bands - A first step in feature selection p0205 A81-49815

LANDSAT SATELLITES
Comparative experimental study on the use of original and compressed multispectral Landsat data of the Bayuda desert p0262 A81-49813
Characteristics, of TIROS, GOES, DMSP and LANDSAT systems
[E81-10192] p0263 N81-29506

LANDSAT 3
LANDSAT C workshop field/laboratory exercises p0280 N81-32571

LARGE AREA CROP INVENTORY EXPERIMENT
Evaluation of large area crop estimation techniques using LANDSAT and ground-derived data --- Missouri
[E81-10200] p0206 N81-29511
Australian transition year special studies
[E81-10179] p0210 N81-33565

LAVA
Comparison of laboratory reflectance spectra and LANDSAT multispectral images of Hawaiian lava flows
[E81-10061] p0266 N81-33541

LEAVES
A model of plant canopy polarization response p0201 A81-48035

LEGUMINOUS PLANTS
The discrimination of cereal crops and legumes using reflectance data in the Landsat bandpasses p0204 A81-49794

LIGHT SCATTERING
An examination of spectral band ratioing to reduce the topographic effect on remotely sensed data p0221 A81-45427
Airborne simultaneous spectroscopic detection of laser-induced water Raman backscatter and fluorescence from chlorophyll a and other naturally occurring pigments p0253 A81-47647
Use of water Raman emission to correct airborne laser fluorosensor data for effects of water optical attenuation p0253 A81-47676
A study of the effects of the atmosphere on thematic mapper observations
[E81-10056] p0276 N81-33540
A comparison of observed and analytically derived remote sensing penetration depths for turbid water
[NASA-TM-83176] p0255 N81-33577

LIGHT TRANSMISSION
Satellite measurements of atmospheric aerosols
[AD-A103493] p0220 N81-33720

LIMNOLOGY
A note on indirect detection of seiches in Great Salt Lake, Utah, by NOAA and Landsat satellite imagery p0247 A81-43218
Hydrogeologic interpretations of Landsat imagery in arid zones of South and West Africa p0248 A81-43229
Observations on Lake Ontario basin hydrogeology from optical enhancements of Landsat imagery p0248 A81-43231
Landsat interpretation of prairie lakes and wetlands of eastern South Dakota p0249 A81-43240
Assessment and classifications of selected Illinois lakes through the application of space technology p0250 A81-43255

LIMONITE
Atmospheric correction to LANDSAT data for limonite discrimination p0228 N81-31594

LINE SPECTRA
A differential inversion method for high resolution atmospheric remote sensing p0215 A81-45862
A technique for line extraction from LANDSAT multi-spectral scanner satellite data with some applications of the technique
[RAE-TR-81010] p0265 N81-31613

LINEAR FILTERS
Inversion of multiwavelength radiometer measurements by three-dimensional filtering p0271 A81-45873

LITHOSPHERE
Ring structures of Precambrian shields, based on the interpretation of space imagery p0225 A81-42278
Gravimetric studies of the earth's crust in the oceans --- Russian book p0221 A81-43524
Early results from Magsat --- studies of near-earth magnetic fields p0274 A81-48945

LONG WAVE RADIATION
Annual and interannual variations in outgoing longwave radiation over the tropics p0251 A81-43356

LOUISIANA
Landsat data for regulatory permit monitoring p0247 A81-43214
Look direction dependence of radar backscattering cross section for agricultural fields p0199 A81-43741

M

MAGNETIC SIGNATURES
Reduction and analysis of satellite magnetometer data p0275 N81-29482

MAGNETIC SURVEYS
Magnetic space-based field measurements
[AAS PAPER 81-077] p0272 A81-46241
Early results from Magsat --- studies of near-earth magnetic fields p0274 A81-48945
Geomagnetic field mapping from a satellite: Spatial power spectra of the geomagnetic field at various satellite altitudes relative to natural noise sources and instrument noise
[PUBL-1810] p0275 N81-29480
Investigation of Antarctic crust and upper mantle using Magsat and other geophysical data
[E81-10113] p0222 N81-32574
Airborne gamma-ray spectrometer and magnetometer survey
[DE81-027157] p0229 N81-32592
Airborne gamma-ray spectrometer and magnetometer survey. Canyon City quadrangle (Oregon), volume 2
[DE81-028682] p0229 N81-33584
Airborne gamma-ray spectrometer and magnetometer survey, Salem quadrangle (Oregon), volume 2
[DE81-028681] p0229 N81-33585

MAGNETIC TAPES
Conversion of SPU-Universal disk file to JSC-Universal tape storage: CONVRT user's guide
[E81-10185] p0263 N81-29501

MAGNETOSPHERE
New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300'
[IAF PAPER 81-212] p0273 A81-47407

MAINE
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions
[E81-10061] p0209 N81-33543

MAN ENVIRONMENT INTERACTIONS
Simulation modeling of estuarine ecosystems p0243 A81-42229
Fitoexomorphogenic analysis of geological environment changes in the South Aral Sea, based on aerial and space imagery p0225 A81-42279
Application of digital image processing techniques and information systems to water quality monitoring of Lake Tahoe p0251 A81-43258
Dynamic ecosystem of the Aral Basin studied from satellite imagery p0217 A81-48682

MANITOBA
A preliminary analysis of SAR mapping of the Manitoba flood, May 1979 p0248 A81-43220
Interpreter evaluations of airborne radar imagery for ecological and land/use cover classification in southern Manitoba p0218 A81-49773
Resource inventory and terrain analysis in north western Manitoba from integrated remote sensing data p0218 A81-49803

MAPPING
Topographic and cartographic applications of photogrammetry p0221 A81-42847
A multistage mapping approach for an irrigated croplands inventory p0198 A81-43262
Mapping irrigated lands in Western Kansas from Landsat p0198 A81-43265
Mapping irrigated cropland on the High Plains using Landsat p0198 A81-43266
Remote sensing aided procedure for conifer growth modeling in the northeastern Sierra Nevada p0199 A81-43740
Land use mapping of Hong Kong from Landsat images - An evaluation p0215 A81-45434
Lineament mapping in northern Sweden from Landsat images using orthogonal image transforms p0226 A81-46039
Cartographic accuracy of synthetic aperture radar imagery p0262 A81-49780
Geomagnetic field mapping from a satellite: Spatial power spectra of the geomagnetic field at various satellite altitudes relative to natural noise sources and instrument noise
[PUBL-1810] p0275 N81-29480
The sensor image simulator
[AD-A101172] p0275 N81-29512
Conceptual design of an automated mapping satellite System (MAPSAT)
[PB81-185555] p0264 N81-29522
Space based topographic mapping experiment using Seasat synthetic aperture radar and LANDSAT 3 return beam vidicon imagery
[NASA-CR-164675] p0223 N81-30496
Ocean services for the nation. National ocean goals and objectives for the 1980's
[PB81-200602] p0240 N81-31808
Airborne gamma-ray spectrometer and magnetometer survey
[DE81-027157] p0229 N81-32592
OVSUP: A program for computer-aided disentanglement of overlapping zones p0222 N81-33525
Photogrammetry in China p0222 N81-33526
Reports on cartography and geodesy, series 1: Original reports, Number 81
[ISSN-0469-4236] p0222 N81-33527
Partially automated object extraction from aerial photographs and land maps p0266 N81-33528
As-built design specification of the automatic registration system for the cartographic technology laboratory
[E81-10176] p0267 N81-33562
An evaluation of detail in dynamic visual displays
[AD-A103378] p0222 N81-33578

MARINE BIOLOGY
Simulation modeling of estuarine ecosystems p0243 A81-42229
Landsat hydrobiological classification for an inland fresh water marsh within Everglades National Park p0249 A81-43238
Remote sensing in biological oceanography p0237 A81-49130

MARINE ENVIRONMENTS
Digital analysis of Landsat MSS data and application for coastal marine environment p0233 A81-43247
Satellites for oceanography - The promises and the realities p0237 A81-49126
Satellite oceanography - The instruments p0274 A81-49134
The Surveillance Satellite Program and the future of microwave remote sensing p0274 A81-49753
NOAA Climate Program plan
[PB81-193815] p0240 N81-30765

MARINE METEOROLOGY
Hurricane 'Flossie' /September 1978/ observed in the north Atlantic, by the Meteosat satellite p0213 A81-41061
Performance evaluation of a spaceborne scatterometer p0269 A81-41920
Rain estimation over several areas of the globe using satellite imagery p0245 A81-43193
The wind speed dependency of ocean microwave backscatter p0234 A81-46109
The study of mesoscale ocean winds p0235 A81-46110
Meteorological applications of the ARGOS system
[IAF PAPER 81-121] p0273 A81-47360
The National Oceanic Satellite System p0236 A81-48548
The future for satellite-derived surface winds p0237 A81-49129
Climate, the oceans, and remote sensing p0237 A81-49132
Atlantic hurricane season of 1980 p0238 A81-49649
The occurrence of vertical tilt in tropical cyclones p0238 A81-49656
Eastern North Pacific tropical cyclones of 1980 p0238 A81-49657
Meteosat experience in assisting commercial fishing p0239 A81-49907
Regression techniques for oceanographic parameter retrieval using space-borne microwave radiometry p0239 A81-49967
Reports on Marine Science Affairs. Report 14: Satellite data requirements for marine meteorological services
[WMO-548] p0239 N81-28668
Altimeter rain detection
[NASA-TM-73291] p0275 N81-29408

MARINE RESOURCES
Multispectral kelp resource surveys p0232 A81-43244

MARITIME SATELLITES
Satellite aided coastal zone monitoring and vessel traffic system p0231 A81-41755
Development of Marine Observation Satellite-1
[AAS PAPER 81-060] p0278 A81-46238
Satellites for oceanography - The promises and the realities p0237 A81-49126
Oceanography from satellites p0237 A81-49127
The promise of satellite altimetry --- for oceanography p0237 A81-49128
Commercial applications of satellite oceanography p0237 A81-49133
Satellite oceanography - The instruments p0274 A81-49134

MARKING

Maximum likelihood labeling
[E81-10177] p0267 N81-33563

MARSHLANDS

Accuracy evaluation of Landsat digital classification of vegetation in the Great Dismal Swamp
p0248 A81-43235

Landsat hydrobiological classification for an inland fresh water marsh within Everglades National Park
p0249 A81-43238

Using Landsat imagery to study the Okavango Swamp, Botswana p0249 A81-43242

Computer-implemented remote sensing techniques for measuring coastal productivity and nutrient transport systems p0250 A81-43243

A report on the use of remote sensing techniques for the supervision of New England coastal salt marshes
p0253 A81-48944

MATHEMATICAL MODELS

Remote sensing aided procedure for conifer growth modeling in the northeastern Sierra Nevada
p0199 A81-43740

Large area application of a corn hazard model --- Soviet Union
[E81-10164] p0205 N81-28497

Evaluation of spring wheat and barley crop calender models for the 1979 crop year
[E81-10197] p0206 N81-29508

Atmospheric correction to LANDSAT data for limonite discrimination p0228 N81-31594

Improved version of the split routine for CLASSY
[E81-10210] p0264 N81-31600

Yield Model Development (YMD) implementation plan for fiscal years 1981 and 1982
[E81-10211] p0208 N81-32577

A review of volume scatter theories for modeling applications p0265 N81-33347

Maximum likelihood estimation for mixture models
[E81-10178] p0210 N81-33564

A crop moisture stress index for large areas and its application in the prediction of spring wheat phenology
[E81-10202] p0210 N81-33573

Topographic slope correction for analysis of thermal infrared images
[PB81-211781] p0224 N81-33589

MATRICES (MATHEMATICS)

A review of volume scatter theories for modeling applications p0265 N81-33347

MAXIMUM LIKELIHOOD ESTIMATES

Maximum likelihood estimation of label imperfection probabilities and its use in the identification of mislabeled patterns --- with application to Landsat MSS data processing p0259 A81-46040

Context distribution estimation for contextual classification of multispectral image data
p0259 A81-46041

Maximum likelihood clustering with dependent feature trees
[E81-10186] p0263 N81-29502

Maximum likelihood labeling
[E81-10177] p0267 N81-33563

Maximum likelihood estimation for mixture models
[E81-10178] p0210 N81-33564

MEDITERRANEAN SEA

Satellite determination of the mesoscale variability of the sea surface temperature p0234 A81-44861

MERCATOR PROJECTION

An evaluation of MSS P-format data registration
[E81-10171] p0267 N81-33557

MESOSCALE PHENOMENA

Satellite determination of the mesoscale variability of the sea surface temperature p0234 A81-44861

The study of mesoscale ocean winds
p0235 A81-46110

Application of GOES visible-infrared data to quantifying mesoscale ocean surface temperatures
p0236 A81-47021

METEOROLOGICAL PARAMETERS

Progress in passive microwave remote sensing - Nonlinear retrieval techniques --- for meteorological parameters
p0271 A81-45872

METEOROLOGICAL RADAR

Performance evaluation of a spaceborne scatterometer
p0269 A81-41920

METEOROLOGICAL SATELLITES

Remote sounding of atmosphere and ocean for climate research /Appleton Lecture/ p0236 A81-47099

Reports on Marine Science Affairs. Report 14: Satellite data requirements for marine meteorological services
[WMO-548] p0239 N81-28668

Characteristics, of TIROS, GOES, DMSP and LANDSAT systems
[E81-10192] p0263 N81-29506

METEOROLOGICAL SERVICES

Rain estimation over several areas of the globe using satellite imagery p0245 A81-43193

METEOROLOGY

Environmental satellites p0277 A81-42231

Radiation studies in the atmosphere
p0216 A81-47001

Basic problems of the physics and chemistry of contemporary changes of climate p0216 A81-47002

METEOSAT SATELLITE

Large-area histograms from Meteosat images
p0260 A81-46917

Potential for detection of natural disasters via Meteosat
[IAF PAPER 81-263] p0216 A81-47430

MEXICO

The environmental vegetation index: A tool potentially useful for arid land management --- Texas and Mexico, plant growth stress due to water deficits
[E81-10191] p0206 N81-29505

MICHIGAN

Categorization of Northern Green Bay ice cover using LANDSAT 1 digital data: A case study
[PB81-200438] p0265 N81-32602

MICRODENSITOMETERS

Microdensitometry to identify saline rangelands on 70-mm color-infrared aerial film p0202 A81-48406

MICROWAVE ANTENNAS

Differential Doppler experiment /DIDEX/ for geodetic applications p0221 A81-47938

MICROWAVE EMISSION

Evaluation of the effect of sea-ice roughness on the microwave emission of the ice p0231 A81-41490

Microwave radiometer measurement of tidally induced salinity changes off the Georgia coast p0232 A81-42067

Monitoring snow with microwaves p0246 A81-43209

Characteristics of microwave emission of significance to satellite remote sensing of soil water p0258 A81-43222

Potential application of satellite radar to monitor soil moisture p0270 A81-43223

Requirements of space-borne microwave radiometers for detecting soil moisture contents p0270 A81-43225

MICROWAVE IMAGERY

Aircraft active microwave measurements for estimating soil moisture p0271 A81-43547

Correlation function studies for snow and ice
p0260 A81-46378

Airborne microwave radiometer remote sensing of lake ice p0253 A81-48554

The Surveillance Satellite Program and the future of microwave remote sensing p0274 A81-49753

Cartographic accuracy of synthetic aperture radar imagery p0262 A81-49780

Freshwater ice thickness observations using passive microwave sensors p0254 A81-49968

Scattering theory with application to synthetic aperture radar p0265 N81-33348

MICROWAVE RADIOMETERS

What has been learned from the scanning multi-channel microwave radiometers /SMMRs/ p0269 A81-41995

Study of the influence of the atmosphere on the performance of an imaging microwave radiometer
[ESA-CR(P)-1421] p0275 N81-30342

MICROWAVE SCATTERING

Satellite scatterometer p0232 A81-42102

Passive microwave sensing of snow characteristics over land p0246 A81-43207

Monitoring snow with microwaves p0246 A81-43209

Active microwave measurements for estimating soil moisture in Oklahoma p0199 A81-43744

The wind speed dependency of ocean microwave backscatter p0234 A81-46109

Single and multiple parameter microwave signatures of sea ice p0238 A81-49774

Evaluation of gravimetric ground truth soil moisture data collected for the agricultural soil moisture experiment, 1978 Colby, Kansas, aircraft mission
[E81-10114] p0205 N81-29494

Measurement of soil moisture trends with airborne scatterometers --- Texas
[E81-10088] p0209 N81-33545

Experiment plan: Row and roughness effects on dependence of active microwave measurements of soil moisture
[E81-10209] p0211 N81-33575

MICROWAVE SENSORS

Progress in passive microwave remote sensing - Nonlinear retrieval techniques --- for meteorological parameters
p0271 A81-45872

The European SAR-Project Convair 580
p0273 A81-46679

Passive microwave systems
[IAF PAPER 81-88] p0273 A81-47342

The National Oceanic Satellite System
p0236 A81-48548

MICROWAVE SPECTROMETERS

Passive microwave techniques for geophysical sensing of the earth from satellites p0270 A81-43071

MILLIMETER WAVES

Millimeter-wave sensing of the environment: A bibliographic survey
[NASA-CR-156879] p0219 N81-32581

MINERAL EXPLORATION

Ore-controlling space geological objects and their assessment techniques applied to mineral prediction
[IAF PAPER 81-107] p0227 A81-47353

Complex processing of satellite images and the geological interpretation p0227 A81-48690

Interactive system for the regional prognosis of raw mineral resources, based on ground-based and satellite imagery data p0227 A81-48691

Remote sensing in development --- for developing nations p0279 A81-48936

Methods development and applications evaluations of NURE aerial reconnaissance survey data for uranium resource evaluation: Beeville/Bay City and Crystal City quadrangles, Texas
[GJBX-69(81)] p0228 N81-30502

Atmospheric correction to LANDSAT data for limonite discrimination p0228 N81-31594

Airborne gamma-ray spectrometer and magnetometer survey
[DE81-027157] p0229 N81-32592

Airborne gamma-ray spectrometer and magnetometer survey. Canyon City quadrangle (Oregon), volume 2
[DE81-028682] p0229 N81-33584

Airborne gamma-ray spectrometer and magnetometer survey. Salem quadrangle (Oregon), volume 2
[DE81-028681] p0229 N81-33585

MINERALOGY

Mineralogical, optical, and geochemical properties of John H. Kerr Reservoir sediment samples for AgRISTARS pollution research
[E81-10155] p0229 N81-33548

MINES (EXCAVATIONS)

A radar image time series p0226 A81-45430

MINICOMPUTERS

A top-down approach to the use of simulation in computer system design --- of Edit Processor of Integrated Photogrammetric Instrument Network p0274 A81-48331

MINNESOTA

Assessing the Red River of the North 1978 flooding from NOAA satellite data p0248 A81-43219

A comparison of remote sensing techniques for Minnesota wetlands classification p0249 A81-43239

Satellite monitoring of snow extent and condition in agricultural, transitional, and forested land cover areas
[PB81-188625] p0254 N81-30509

A study of Minnesota land and water resources using remote sensing, Volume 14
[E81-10166] p0254 N81-33550

Synergistic relationships among remote-sensing and geophysical media: Geological and hydrological applications --- detecting near-surface ground water in Minnesota p0255 N81-33553

A project to evaluate moisture stress and phenological factors in corn and soybean areas of southwestern and south-central Minnesota p0209 N81-33554

Evaluation of LANDSAT data analysis for forest survey --- northeastern aspen-birch survey unit in Minnesota - Carlton County
[E81-10175] p0210 N81-33561

MISSISSIPPI

A satellite derived technique for estimating rainfall from thunderstorms and hurricanes p0244 A81-43191

MISSOURI

Evaluation of multiband, multitemporal, and transformed LANDSAT MSS data for land cover area estimation --- North Central Missouri
[E81-10161] p0219 N81-29496

Evaluation of large area crop estimation techniques using LANDSAT and ground-derived data --- Missouri
[E81-10200] p0206 N81-29511

Crop area estimation using ground-gathered and sampled LANDSAT data
[PB81-192783] p0207 N81-30507

Crop area estimates using ground-gathered and LANDSAT data. A multitemporal approach: Missouri, 1979
[PB81-186751] p0208 N81-31614

MISSOURI RIVER (US)

Remote sensing of bank erosion along the Missouri River, South Dakota p0213 A81-43263

MOISTURE CONTENT

Determination of moisture from NOAA polar orbiting satellite sounding radiances p0243 A81-41158

Monitoring snow with microwaves p0246 A81-43209

Aircraft active microwave measurements for estimating soil moisture p0271 A81-43547

Application of multispectral reflectance studies of soils - Pre-Landsat p0200 A81-46031

Assessing winter wheat dry matter production via spectral reflectance measurements p0202 A81-49344

MONTANA

Use of remote sensing in landscape stratification for environmental impact assessment p0214 A81-43748

Assessing winter wheat dry matter production via spectral reflectance measurements p0202 A81-49344

Detection of changes in a coal surface mining area by ratioing multidate Landsat digital data
p0228 A81-49809

A crop moisture stress index for large areas and its application in the prediction of spring wheat phenology
[E81-10202] p0210 N81-33573

MOTHS

Effect of forest canopy closure on incoming solar radiance
[E81-10170] p0205 N81-28499

MOUNTAINS

Mountain pine beetle damage surveys with high-altitude panoramic photography p0199 A81-43732

Application of digital terrain data to quantify and reduce the topographic effect on Landsat data
p0259 A81-45433

Mapping alpine soils using color positive and color infrared photographs p0252 A81-46045

Stereoorthophotos as aids in the mapping of high mountain regions p0221 A81-46678

MULTISPECTRAL BAND SCANNERS

Application of digital terrain data to quantify and reduce the topographic effect on Landsat data
p0259 A81-45433

Simulation of orbital image-sensor geometry p0260 A81-46192

Sampling Landsat classifications for crop area estimation p0202 A81-46404

MULTISPECTRAL PHOTOGRAPHY

Some results on the investigation of earth resources by aerial and polygon methods --- Russian book p0269 A81-41476

Aerial data acquisition systems using test-ground polygons p0269 A81-41477

Accuracy of transmission of spectral contrasts in multispectral aerial photography, with application to problems of object recognition p0257 A81-41479

Experience with image combination in multispectral aerial photography p0257 A81-41481

Pseudocolor representation of multispectral aerial images by means of a three-channel projector p0269 A81-41483

The use of the spectral and physical-geographic characteristics of natural objects for the interpretation of multispectral satellite images p0257 A81-41484

Determination of the types and state of crops from multispectral aerial photographs p0197 A81-41486

Evaluation of the possibility of using spectral-band and multispectral aerial photographs for the large-scale survey of natural pastures p0197 A81-41487

The possibilities of the automated classification of agricultural objects on the basis of their multispectral aerial-spaceborne images p0197 A81-41488

Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects p0197 A81-41489

Roles of satellites in hydrology p0245 A81-43199

Potentials of mapping buried glacier ice with Landsat thermal imagery p0246 A81-43204

Remote sensing of coastal pollutants using multispectral data p0233 A81-43245

Relating ground level reflected radiance measurements in the Landsat MSS bandpasses to satellite altitudes p0271 A81-43735

Earth applications orbit analysis for a shuttle-mounted Multispectral Mapper [AAS PAPER 81-182] p0271 A81-45836

Automatic processing of computer compatible tapes with data from multispectral scanners installed in Landsat satellites p0272 A81-46029

A technique for line extraction from LANDSAT multi-spectral scanner satellite data with some applications of the technique [RAE-TR-81010] p0265 N81-31613

Crop area estimates using ground-gathered and LANDSAT data. A multitemporal approach: Missouri, 1979 [PB81-186751] p0208 N81-31614

MULTIVARIATE STATISTICAL ANALYSIS

Maximum likelihood estimation for mixture models [E81-10178] p0210 N81-33564

N

NASA PROGRAMS

Future plans for NASA's Oceanic Processes Program p0231 A81-41997

NASA water resources/hydrology remote sensing program in the 1980's p0244 A81-43179

NASA authorization, 1982, volume 4 [GPO-79-432-VOL-4] p0279 N81-31030

NATIONAL OCEANIC SATELLITE SYSTEM

Future plans for NASA's Oceanic Processes Program p0231 A81-41997

The National Oceanic Satellite System p0236 A81-48548

NATURAL GAS EXPLORATION

The use of imagery of the earth to study the structure of degassing zones within oil and gas basins p0225 A81-42276

The use of satellite imagery for studying the structural features of the Caspian oil and gas region p0227 A81-48684

The interrelation of linear and isometric objects on satellite imagery and the oil and gas structures of the Buzuluk Basin p0227 A81-48685

NEBRASKA

Seasat satellite investigation of the structure of western Nebraska and its application to the evaluation of geothermal resources [LA-UR-81-1454] p0223 N81-30505

NEW ENGLAND (US)

A report on the use of remote sensing techniques for the supervision of New England coastal salt marshes p0253 A81-48944

NEW MEXICO

Landform-vegetation relationships in the northern Chihuahuan Desert [AD-A102896] p0208 N81-32588

NEW YORK

Manual versus digital Landsat analysis for modeling river flooding p0252 A81-43745

Manual versus digital Landsat analysis for delineating river flooding p0252 A81-46405

Cornell University Remote Sensing Program [E81-10174] p0255 N81-33560

NEW ZEALAND

Geomorphic mapping from Landsat-3 Return Beam Vidicon /RBV/ imagery p0226 A81-46194

NICARAGUA

An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions [E81-10081] p0209 N81-33543

NIGHT

Radiometry with nighttime DMSP images in digital form --- satellite earth observations p0260 A81-46402

NITRIC ACID

Atmospheric nitric acid and chlorofluoromethane 11 from interferometric spectra obtained at the Observatoire du Pic du Midi [AERONOMICA-ACTA-A-227-1980] p0219 N81-30656

NORTH AMERICA

A description of the reformatted spring small grains labeling procedure used in test 2, part 2 of the US/Canada wheat and barley exploratory experiment [E81-10206] p0207 N81-31597

Weather analysis and interpretation procedures developed for the US/Canada wheat and barley exploratory experiment [E81-10208] p0207 N81-31599

NORTH CAROLINA

Roles of satellites in hydrology p0245 A81-43199

Accuracy evaluation of Landsat digital classification of vegetation in the Great Dismal Swamp p0248 A81-43235

Combined satellite imagery for study of coastal circulation, Onslow Bay, North Carolina p0233 A81-43250

Trophic state determination for shallow coastal lakes from Landsat imagery p0251 A81-43259

Mapping wetlands using orthophotoquads and 35-mm aerial photographs p0251 A81-43543

NORTH DAKOTA

Assessing the Red River of the North 1978 flooding from NOAA satellite data p0248 A81-43219

A temporal/spectral analysis of small grain crops and confusion crops --- North Dakota [E81-10167] p0205 N81-28498

A crop moisture stress index for large areas and its application in the prediction of spring wheat phenology [E81-10202] p0210 N81-33573

NORTHERN HEMISPHERE

Measurements of CF2Cl2, CFCl3, and N2O in the lower stratosphere between 2 deg S and 73 deg N latitude p0214 A81-44515

Eastern North Pacific tropical cyclones of 1980 p0238 A81-49657

NORWAY

Satellite Image Atlas of the earth's glaciers p0246 A81-43202

Operational use of satellite data for snow inventory and runoff forecast p0246 A81-43210

NUTRIENTS

Computer-implemented remote sensing techniques for measuring coastal productivity and nutrient transport systems p0250 A81-43243

O

OCEAN BOTTOM

Applications of aerospace data for detection of submarine springs in Jamaica p0226 A81-43232

Gravimetric studies of the earth's crust in the oceans --- Russian book p0221 A81-43524

Interpretation of hydrographic features seen in the waters off Cape Cod [AD-A102343] p0240 N81-31803

Derivation of shallow ocean bottom reflectance values from color aerial photography [AD-A101105] p0241 N81-33763

OCEAN COLOR SCANNER

Use of ocean color scanner data in water quality mapping p0251 A81-43545

OCEAN CURRENTS

Method for estimation of ocean current velocity from satellite images p0231 A81-41350

Drift and dispersion studies of ocean-dumped waste using Landsat imagery and current drogues p0233 A81-43539

The structure of short gravity waves on the ocean surface p0234 A81-46105

Detection of the Gulf Stream p0235 A81-46115

Tracking of a warm water ring p0235 A81-46117

Satellite-tracked drift buoy observations of the near-surface flow in the eastern mid-latitude North Pacific p0236 A81-47022

Drifting buoy data from the tropical Pacific Ocean during NORPAX equatorial test shuttle experiment [PB81-198939] p0240 N81-31807

OCEAN DATA ACQUISITIONS SYSTEMS

Oceanic Satellite Data Distribution System p0231 A81-41996

Remote sensing of oceanic phytoplankton - Present capabilities and future goals p0232 A81-42215

Development of Marine Observation Satellite-1 [AAS PAPER 81-060] p0278 A81-46238

Nimbus-7 Coastal-Zone Colour Scanner data processing for Earthnet Experience to date p0235 A81-46919

Meteorological applications of the ARGOS system [IAF PAPER 81-121] p0273 A81-47360

The National Oceanic Satellite System p0236 A81-48548

Commercial applications of satellite oceanography p0237 A81-49133

Satellite oceanography - The instruments p0274 A81-49134

Coastal Oceans Monitoring Satellite System (COMSS) system evaluation study [ESS/SS-1035] p0239 N81-30168

Drifting buoy data from the tropical Pacific Ocean during NORPAX equatorial test shuttle experiment [PB81-198939] p0240 N81-31807

Ocean services for the nation. National ocean goals and objectives for the 1980's [PB81-200602] p0240 N81-31808

OCEAN DYNAMICS

Future plans for NASA's Oceanic Processes Program p0231 A81-41997

OCEAN SURFACE

What has been learned from the scanning multi-channel microwave radiometers /SMMRs/ p0269 A81-41995

Imaging ocean waves by synthetic aperture radars with long integration times p0231 A81-42026

A comparison of Seasat 1 altimeter measurements of wave height with measurements made by a pitch-roll buoy p0231 A81-42066

Satellite scatterometer p0232 A81-42102

Investigation of illumination in the image plane of the receiving optical system for the aerial or spaceborne photography of the world ocean p0232 A81-42553

Features of the radar detection of sea surface nonuniformities p0234 A81-43967

Particular features of the ocean glitter pattern observed from a sun-synchronous orbit p0234 A81-45436

Orbit determination requirements for TOPEX --- NASA ocean surface TOPography mapping EXperiment [AAS PAPER 81-158] p0221 A81-45828

Atmospheric correction of Nimbus-7 Coastal Zone Color Scanner imagery p0271 A81-45879

Application of the truncated normal distribution technique to the derivation of sea surface temperatures p0234 A81-45881

The structure of short gravity waves on the ocean surface p0234 A81-46105

SAR ocean imaging mechanisms p0234 A81-46107

The wind speed dependency of ocean microwave backscatter p0234 A81-46109

The study of mesoscale ocean winds p0235 A81-46110

Spatial evolution of ocean wave spectra p0235 A81-46112

Refraction of coastal ocean waves p0235 A81-46113

A search for cold water rings p0235 A81-46116

Correlation between integral and spectral albedos of clouds over water surfaces p0235 A81-47004

Application of GOES visible-infrared data to quantifying mesoscale ocean surface temperatures p0236 A81-47021

Satellite-tracked drift buoy observations of the near-surface flow in the eastern mid-latitude North Pacific p0236 A81-47022

Radar altimeter for ocean remote sensing [IAF PAPER 81-94] p0236 A81-47348

The future for satellite-derived surface winds p0237 A81-49129

SAR processing of partially coherent and sinusoidally dynamic ocean waves p0239 A81-49776

Airborne remote sensing of sea surface chlorophyll and temperature along the outer British Columbia coast p0239 A81-49805

Radar altimeter waveform modeled parameter recovery --- SEASAT-1 data [NASA-TM-73294] p0275 N81-30325

Interpretation of hydrographic features seen in the waters off Cape Cod [AD-A102343] p0240 N81-31803

Imaging radar systems --- ocean surface imaging p0240 N81-33342

Sea surface scattering p0241 N81-33344

Wave orbital velocity, fade and SAR response to azimuth waves p0265 N81-33345

Scattering theory with application to synthetic aperture radar p0265 N81-33348

Gulf of Mexico satellite radar altimetry [NASA-TM-73295] p0224 N81-33760

OCEAN TEMPERATURE

Satellite determination of the mesoscale variability of the sea surface temperature p0234 A81-44861

Atmospheric correction of Nimbus-7 Coastal Zone Color Scanner imagery p0271 A81-45879

Application of the truncated normal distribution technique to the derivation of sea surface temperatures p0234 A81-45881

Tracking of a warm water ring p0235 A81-46117

Application of GOES visible-infrared data to quantifying mesoscale ocean surface temperatures p0236 A81-47021

OCEANOGRAPHIC PARAMETERS

A comparison of Seasat 1 altimeter measurements of wave height with measurements made by a pitch-roll buoy p0231 A81-42066

Aerospace remote sensing of the coastal zone for water quality and biotic productivity applications p0233 A81-43246

Detection of the Gulf Stream p0235 A81-46115

The first ESA remote sensing satellite /ERS/ - The programme and the system [IAF PAPER 81-90] p0236 A81-47344

Regression techniques for oceanographic parameter retrieval using space-borne microwave radiometry p0239 A81-49967

OCEANOGRAPHY

Seasat data applications by commercial users p0231 A81-41974

Future plans for NASA's Oceanic Processes Program p0231 A81-41997

Remote sensing of oceanic phytoplankton - Present capabilities and future goals p0232 A81-42215

Application of remote sensing to monitoring and studying dispersion in ocean dumping p0232 A81-42228

Environmental satellites p0277 A81-42231

Use of ocean color scanner data in water quality mapping p0251 A81-43545

Remote sensing of atmospheres and oceans: Proceedings of the Interactive Workshop on Interpretation of Remotely Sensed Data, Williamsburg, VA, May 23-25, 1979 p0234 A81-45861

Spaceborne synthetic aperture radar for oceanography --- Book p0234 A81-46104

Remote sounding of atmosphere and ocean for climate research /Appleton Lecture/ p0236 A81-47099

First results of the Intercosmos satellite IK-21 [IAF PAPER 81-214] p0274 A81-47409

An analysis of the data of synchronous measurements from the Meteor satellite and ships at the eastern coast of the Caspian Sea p0237 A81-48687

Satellites for oceanography - The promises and the realities p0237 A81-49126

Oceanography from satellites p0237 A81-49127

The promise of satellite altimetry --- for oceanography p0237 A81-49128

Climate, the oceans, and remote sensing p0237 A81-49132

Commercial applications of satellite oceanography p0237 A81-49133

Satellite oceanography - The instruments p0274 A81-49134

Compact and highly sensitive fluorescence lidar for oceanographic measurements p0237 A81-49378

Theoretical investigations concerning the measurement of the plankton concentration with the aid of satellites p0237 A81-49426

Meteosat experience in assisting commercial fishing p0239 A81-49807

Following oceanographic phenomena on the South Coast of Brazil with remote sensing from orbital distance [INPE-1975-RPE/280] p0240 N81-30498

OFFSHORE ENERGY SOURCES

Experimental use of real time SAR imagery in support of oil exploration in the Beaufort Sea p0227 A81-49767

OHIO

A practical method for the verification of computer-processed Landsat data p0261 A81-48943

OHIO RIVER (US)

NASA participation in the 1980 Persistent Elevated Pollution Episode/Northeast Regional Oxidant Study (PEPE/NROS) Project: Operational aspects [NASA-TM-83170] p0220 N81-32708

OIL EXPLORATION

The use of imagery of the earth to study the structure of degassing zones within oil and gas basins p0225 A81-42276

Gravimetric studies of the earth's crust in the oceans --- Russian book p0221 A81-43524

The use of satellite imagery for studying the structural features of the Caspian oil and gas region p0227 A81-48684

The interrelation of linear and isometric objects on satellite imagery and the oil and gas structures of the Buzuluk Basin p0227 A81-48685

Remote sensing in development --- for developing nations p0279 A81-48936

OIL FIELDS

Identification of subresolution high temperature sources using a thermal IR sensor p0273 A81-46401

OIL POLLUTION

Satellite detection of oil on the marine surface p0233 A81-43251

OIL SLICKS

Features of the radar detection of sea surface nonuniformities p0234 A81-43967

OKLAHOMA

Aircraft active microwave measurements for estimating soil moisture p0271 A81-43547

Active microwave measurements for estimating soil moisture in Oklahoma p0199 A81-43744

ONBOARD DATA PROCESSING

Earth applications orbit analysis for a shuttle-mounted Multispectral Mapper [AAS PAPER 81-182] p0271 A81-45836

Program and instrumentation of the satellite experiment Bulgaria-1300 II [IAF PAPER 81-91] p0273 A81-47345

Application of delta modulation in on-board and ground video data processing systems for the purposes of remote sensing [IAF PAPER 81-102] p0260 A81-47361

ONTARIO

Applicability of airborne SAR data to geological mapping p0227 A81-49769

SAR image response over a conifer regeneration site p0203 A81-49770

Application of synthetic aperture radar data to snow cover monitoring p0253 A81-49778

Digital enhancements for vegetation mapping in a subarctic environment p0262 A81-49793

OPTICAL DENSITY

Synergistic relationships among remote-sensing and geophysical media: Geological and hydrological applications --- detecting near-surface ground water in Minnesota p0255 N81-33553

OPTICAL MEASUREMENT

Investigation of the efficiency of the optical sounding of aerosol by the use of spectral photometers p0215 A81-45406

OPTICAL POLARIZATION

A model of plant canopy polarization response p0201 A81-46035

OPTICAL PROPERTIES

An analysis of haze effects on LANDSAT multispectral scanner data [E81-10162] p0263 N81-29497

OPTICAL RADAR

Compact and highly sensitive fluorescence lidar for oceanographic measurements p0237 A81-49378

OPTICAL SCANNERS

Particular features of the ocean glitter pattern observed from a sun-synchronous orbit p0234 A81-45436

OPTICAL THICKNESS

Satellite measurements of tropospheric aerosols [NASA-CR-3459] p0219 N81-31680

ORBIT CALCULATION

Earth applications orbit analysis for a shuttle-mounted Multispectral Mapper [AAS PAPER 81-182] p0271 A81-45836

ORBITAL ELEMENTS

Simulation of orbital image-sensor geometry p0260 A81-46192

The characteristics of combining devices with different survey bands aboard a satellite p0274 A81-48689

ORBITAL VELOCITY

Wave orbital velocity, fade and SAR response to azimuth waves p0265 N81-33345

OREGON

A photo interpretation approach to forest regrowth monitoring using side-looking airborne radar - Grant County, Oregon p0200 A81-45428

Airborne gamma-ray spectrometer and magnetometer survey: Canyon City quadrangle (Oregon), volume 2 [DE81-028682] p0229 N81-33584

Airborne gamma-ray spectrometer and magnetometer survey, Salem quadrangle (Oregon), volume 2 [DE81-028681] p0229 N81-33585

OROGRAPHY

Landsat derived snow cover as an input variable for snow melt runoff forecasting in South Central Colorado p0246 A81-43208

Multisensor analysis of hydrologic features with emphasis on the Seasat SAR p0251 A81-43544

ORTHOPHOTOGRAPHY

A rectification technique for digital orthophoto production p0257 A81-41067

Mapping wetlands using orthophotoquads and 35-mm aerial photographs p0251 A81-43543

Stereoorthophotos as aids in the mapping of high mountain regions p0221 A81-46678

OSTA-1 PAYLOAD

First Shuttle payload loading to begin p0273 A81-46461

OZONE

A differential inversion method for high resolution atmospheric remote sensing p0215 A81-45862

Role of multiple scattering in ozone profile retrieval from satellite measurements in the ultraviolet p0215 A81-45870

P

PACIFIC ISLANDS

Remote sensing of soil radionuclide fluxes in a tropical ecosystem --- Eniwetok and Bikini Atolls [UCRL-84501] p0219 N81-29517

PACIFIC NORTHWEST (US)

Technical aspects of forest inventory demonstrations using Landsat data - Projects in the Pacific Northwest States p0203 A81-49764

PACIFIC OCEAN

Satellite detection of oil on the marine surface p0233 A81-43251

Satellite-tracked drift buoy observations of the near-surface flow in the eastern mid-latitude North Pacific p0236 A81-47022

The occurrence of vertical tilt in tropical cyclones p0238 A81-49656

Eastern North Pacific tropical cyclones of 1980 p0238 A81-49657

Airborne remote sensing of sea surface chlorophyll and temperature along the outer British Columbia coast p0239 A81-49805

Drifting buoy data from the tropical Pacific Ocean during NORPAX equatorial test shuttle experiment [PB81-198939] p0240 N81-31807

PARALLEL PROCESSING (COMPUTERS)

Parallel processing implementations of a contextual classifier for multispectral remote sensing data p0272 A81-46028

Inventory estimation on the massively parallel processor --- from satellite based images p0259 A81-46052

PARAMETER IDENTIFICATION

Inversion of multiwavelength radiometer measurements by three-dimensional filtering p0271 A81-45873

PARTICLE SIZE DISTRIBUTION

Satellite measurements of atmospheric aerosols [AD-A103493] p0220 N81-33720

PATTERN RECOGNITION

Accuracy of transmission of spectral contrasts in multispectral aerial photography, with application to problems of object recognition p0257 A81-41479

Experience with image combination in multispectral aerial photography p0257 A81-41481

Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects p0197 A81-41489

A measure of reliability for classification of earth satellite data p0257 A81-42631

From landforms to avian habitat - A look at topology p0214 A81-43739

A comparison of automatic classification algorithms for land use map by remotely sensed data p0215 A81-44701

Progress in passive microwave remote sensing - Nonlinear retrieval techniques --- for meteorological parameters p0271 A81-45872

An assessment of Landsat data acquisition history on identification and area estimation of corn and soybeans p0200 A81-46032

Procedure M - A framework for stratified area estimation --- in multispectral scanner data processing p0201 A81-46036

Maximum likelihood estimation of label imperfection probabilities and its use in the identification of mislabeled patterns --- with application to Landsat MSS data processing p0259 A81-46040

Inventory estimation on the massively parallel processor --- from satellite based images p0259 A81-46052

Procedure 1 and forestland classification using Landsat data p0201 A81-46055

Integration and comparison of SAR and MSS data for potato crop area estimation p0203 A81-49766

Interpreter evaluations of airborne radar imagery for ecological and land/use cover classification in southern Manitoba p0218 A81-49773

Colour - The critical photointerpretation element in the identification of rangeland plant communities on colour and colour-infrared aerial photography p0203 A81-49786

Maximum likelihood clustering with dependent feature trees [E81-10186] p0263 N81-29502

Evaluation of large area crop estimation techniques using LANDSAT and ground-derived data --- Missouri [E81-10200] p0206 N81-29511

Interactive digital image processing for terrain data extraction [AD-A101321] p0264 N81-30499

Improved version of the split routine for CLASSY [E81-10210] p0264 N81-31600

Identifying igneous rocks in an arid environment on aerial photography by photo tone and photo texture [AD-A102808] p0228 N81-32587

Partially automated object extraction from aerial photographs and land maps p0266 N81-33528

The use of charge transfer devices for LANDSAT pattern classification [E81-10087] p0266 N81-33544

Evaluation of LANDSAT data analysis for forest survey --- northeastern aspen-birch survey unit in Minnesota - Carlton County [E81-10175] p0210 N81-33561

Maximum likelihood labeling [E81-10177] p0267 N81-33563

PATTERN REGISTRATION

Evaluation of multiband, multitemporal, and transformed LANDSAT MSS data for land cover area estimation --- North Central Missouri [E81-10161] p0219 N81-29496

A description of the reformatted spring small grains labeling procedure used in test 2, part 2 of the US/Canada wheat and barley exploratory experiment [E81-10206] p0207 N81-31597

An evaluation of MSS P-format data registration [E81-10171] p0267 N81-33557

As-built design specification of the automatic registration system for the cartographic technology laboratory [E81-10176] p0267 N81-33562

PEAT

Current resource mapping and environmental monitoring applications using Landsat MSS data in Scotland p0218 A81-49806

PENNSYLVANIA

Application of digital terrain data to quantify and reduce the topographic effect on Landsat data p0259 A81-45433

Space based topographic mapping experiment using Seasat synthetic aperture radar and LANDSAT 3 return beam vidicon imagery [NASA-CR-164675] p0223 N81-30496

PERFORMANCE TESTS

Performance evaluation of a spaceborne scatterometer p0269 A81-41920

PHENOLOGY

Remote sensing and mapping of pastures p0213 A81-42281

Rapeseed - Guidelines for operational monitoring p0203 A81-49784

Analysis of US spring wheat and spring barley periodic ground truth [E81-10203] p0208 N81-32576

Scatterometer measurements on crop and soil surfaces p0208 N81-33349

A project to evaluate moisture stress and phenological factors in corn and soybean areas of southwestern and south-central Minnesota p0209 N81-33554

Crop phenology and LANDSAT-based irrigated lands inventory in the high plains: Appendices [E81-10172] p0210 N81-33558

Crop phenology and LANDSAT-based irrigated lands inventory in the high plains [E81-10173] p0210 N81-33559

A crop moisture stress index for large areas and its application in the prediction of spring wheat phenology [E81-10202] p0210 N81-33573

PHILIPPINES

Tiwi geothermal project - The Philippines p0225 A81-41908

PHOTOGEOLOGY

Tiwi geothermal project - The Philippines p0225 A81-41908

The use of imagery of the earth to study the structure of degassing zones within oil and gas basins p0225 A81-42276

Concerning the hydrogeological significance of faults on platform regions, as revealed by space imagery p0225 A81-42277

Ring structures of Precambrian shields, based on the interpretation of space imagery p0225 A81-42278

Fitoexomorphogenic analysis of geological environment changes in the South Aral Sea, based on aerial and space imagery p0225 A81-42279

Space research on seismic regions p0225 A81-42280

Geological interpretation in an interactive mode in automated systems of digital image processing p0225 A81-42289

Hydrogeology of glacial deposits from aerial photographs p0252 A81-43548

The possibility of using an aerial thermal survey for studying the structure of the salt bed in the Gulf of Kara-Bogaz-Gol p0226 A81-44061

A radar image time series p0226 A81-45430

Ore-controlling space geological objects and their assessment techniques applied to mineral prediction [IAF PAPER 81-107] p0227 A81-47353

The informational estimation of the effectiveness of using satellite imagery in hydrogeological research p0227 A81-48683

The use of satellite imagery for studying the structural features of the Caspian oil and gas region p0227 A81-48684

The interrelation of linear and isometric objects on satellite imagery and the oil and gas structures of the Buzuluk Basin p0227 A81-48685

Complex processing of satellite images and the geological interpretation p0227 A81-48690

Interactive system for the regional prognosis of raw mineral resources, based on ground-based and satellite imagery data p0227 A81-48691

Lineaments - Problems and directions of studies by means of aerial and space tools and methods p0221 A81-48696

Landsat data as a basis for regional environmental assessment within the Columbia Plateau p0218 A81-49798

Geological and terrain analysis of the Annapolis County region of Nova Scotia - An application of digital Landsat, radar and colour infrared data p0227 A81-49802

Atmospheric correction to LANDSAT data for limonite discrimination p0228 N81-31594

Visual enhancement of images of natural resources: Applications in geology [E81-10181] p0228 N81-32575

Remote sensing for engineering site selection [AD-A102810] p0219 N81-32586

Identifying igneous rocks in an arid environment on aerial photography by photo tone and photo texture [AD-A102809] p0228 N81-32587

Comparison of laboratory reflectance spectra and LANDSAT multispectral images of Hawaiian lava flows [E81-10061] p0266 N81-33541

An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions [E81-10081] p0209 N81-33543

PHOTOGRAMMETRY

A rectification technique for digital orthophoto production p0257 A81-41057

Experience with the determination of optical image distortions of landscape elements on IR aerial photographs p0257 A81-41480

Experience with image combination in multispectral aerial photography p0257 A81-41481

Analysis of the geometry of a frame photograph p0221 A81-42554

Determination of the external-orientation elements of single photographs and stereopairs p0257 A81-42555

Topographic and cartographic applications of photogrammetry p0221 A81-42847

Multispectral kelp resource surveys p0232 A81-43244

Hardware aspects of digital mapping p0271 A81-43530

Correlation techniques and devices --- for photogrammetry p0258 A81-43531

Automation in photogrammetry p0258 A81-43532

Skylab in retrospect p0277 A81-43535

A capture-recapture approach for estimation of detection probabilities in aerial surveys p0258 A81-43546

Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers p0198 A81-43727

Manual versus digital Landsat analysis for modeling river flooding p0252 A81-43745

A radar image time series p0226 A81-45430

A comparison between two photographic methods for the determination of relative bidirectional reflectance p0259 A81-45431

A top-down approach to the use of simulation in computer system design --- of Edit Processor of Integrated Photogrammetric Instrument Network p0274 A81-48331

Image correlation algorithms p0261 A81-48473

The influence of the accuracy of determining the elements of the external orientation of a stereopair on the processing of aerial photographs on the basis of adjusting elements p0261 A81-48773

Application of new precision measuring systems for photogrammetric comparators [BMFT-FB-T-80-134] p0276 N81-32595

Photogrammetry in China p0222 N81-33526

Military geodesy and geospace science, unit one [AD-A104038] p0222 N81-33581

PHOTOGRAPHIC EQUIPMENT

The signal-to-noise ratio of a space photographic system p0269 A81-42284

PHOTOGRAPHIC PROCESSING

Accuracy of transmission of spectral contrasts in multispectral aerial photography, with application to problems of object recognition p0257 A81-41479

PHOTOGRAPHIC RECTIFIERS

A rectification technique for digital orthophoto production p0257 A81-41057

PHOTOGRAPHS

Determination of the external-orientation elements of single photographs and stereopairs p0257 A81-42555

Analysis of landfills with historic airphotos p0216 A81-46407

Interim catalog ground data summary, data acquisition year 1976 [E81-10132] p0209 N81-33546

PHOTOINTERPRETATION

Some results on the investigation of earth resources by aerial and polygon methods --- Russian book p0269 A81-41476

Pseudocolor representation of multispectral aerial images by means of a three-channel projector p0269 A81-41483

The use of the spectral and physical-geographic characteristics of natural objects for the interpretation of multispectral satellite images p0257 A81-41484

Determination of the types and state of crops from multispectral aerial photographs p0197 A81-41486

Evaluation of the possibility of using spectral-band and multispectral aerial photographs for the large-scale survey of natural pastures p0197 A81-41487

The possibilities of the automated classification of agricultural objects on the basis of their multispectral aerial-spaceborne images p0197 A81-41488

Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects p0197 A81-41489

Ring structures of Precambrian shields, based on the interpretation of space imagery p0225 A81-42278

Geological interpretation in an interactive mode in automated systems of digital image processing p0225 A81-42289

A measure of reliability for classification of earth satellite data p0257 A81-42631

Hydrogeologic interpretations of Landsat imagery in arid zones of South and West Africa p0248 A81-43229

Landsat classification of coastal wetlands in Texas p0248 A81-43234

A comparison of remote sensing techniques for Minnesota wetlands classification p0249 A81-43239

Landsat interpretation of prairie lakes and wetlands of eastern South Dakota p0249 A81-43240

Assessment and classifications of selected Illinois lakes through the application of space technology p0250 A81-43255

Mapping irrigated lands in Western Kansas from Landsat p0198 A81-43265

Comparison of sampling procedures and data analysis for a land-use and land-cover map p0213 A81-43533

Spatial correlation effects upon accuracy of supervised classification of land cover p0213 A81-43534

Rainforest species on large-scale color photos p0198 A81-43536

Generation and use of digital elevation data for large areas p0221 A81-49811

Military geodesy and geospace science, unit one [AD-A104038] p0222 N81-33581

PHOTORECONNAISSANCE

Aerial data acquisition systems using test-ground polygons p0269 A81-41477

PLAINS

Mapping irrigated cropland on the High Plains using Landsat p0198 A81-43266

PLANKTON

Remote sensing of oceanic phytoplankton - Present capabilities and future goals p0232 A81-42215

Remote sensing in biological oceanography p0237 A81-49130

Theoretical investigations concerning the measurement of the plankton concentration with the aid of satellites p0237 A81-49426

Airborne remote sensing of sea surface chlorophyll and temperature along the outer British Columbia coast p0239 A81-49805

Environmental assessment of the Alaskan continental shelf: Reports of principal investigators. Volume 1: Reactors - birds, plankton, littoral, benthos [PB81-196263] p0240 N81-30780

PLANT STRESS

The effect of sensor bandpass and spectral response in crop stress detection p0199 A81-43737

Large area application of a corn hazard model --- Soviet Union [E81-10164] p0205 N81-28497

Soil moisture inferences from thermal infrared measurements of vegetation temperatures [E81-10184] p0208 N81-29500

The environmental vegetation index: A tool potentially useful for arid land management --- Texas and Mexico, plant growth stress due to water deficits [E81-10191] p0206 N81-29505

A study of Minnesota land and water resources using remote sensing, Volume 14 [E81-10166] p0254 N81-33550

A project to evaluate moisture stress and phenological factors in corn and soybean areas of southwestern and south-central Minnesota p0209 N81-33554

A crop moisture stress index for large areas and its application in the prediction of spring wheat phenology [E81-10202] p0210 N81-33573

PLANTS (BOTANY)

A model of plant canopy polarization response p0201 A81-46035

Colour - The critical photointerpretation element in the identification of rangeland plant communities on colour and colour-infrared aerial photography p0203 A81-49786

PLASMA INTERACTIONS

New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300' [IAF PAPER 81-212] p0273 A81-47407

PLATEAUS

Interactive processing of Landsat image for morphopedological studies p0259 A81-46043

The informational estimation of the effectiveness of using satellite imagery in hydrogeological research p0227 A81-48683

PLAYAS

Optical and digital analyses of Landsat data depicting hydrogeological features of the Daryacheh-Ye-Namak area, Iran p0225 A81-43215

PLOWING

Experiment plan: Row and roughness effects on dependence of active microwave measurements of soil moisture [E81-10209] p0211 N81-33575

POINT SOURCES

Environmental measurements of power plant cooling tower and stack plumes [DOE/EV-02463/6] p0219 N81-30695

POLAND

Present state of remote sensing development in Poland p0279 A81-49763

POLAR METEOROLOGY

Possible applications of communication satellites for research tasks in polar regions [BMFT-FB-W-80-029] p0267 N81-33587

POLAR REGIONS

Satellite Image Atlas of the earth's glaciers p0246 A81-43202

POLARIZATION (WAVES)

Optimal polarization concept in radar imaging --- electromagnetic scattering p0265 N81-33350

POLLUTION MONITORING

Stratospheric sulfate from the Gareloi eruption, 1980 - Contribution to the 'ambient' aerosol by a poorly documented volcanic eruption p0213 A81-41404

Application of remote sensing to monitoring and studying dispersion in ocean dumping p0232 A81-42228

Remote sensing of coastal pollutants using multispectral data p0233 A81-43245

Satellite detection of oil on the marine surface p0233 A81-43251

Application of digital image processing techniques and information systems to water quality monitoring of Lake Tahoe p0251 A81-43258

Features of the radar detection of sea surface nonuniformities p0234 A81-43967

Airborne simultaneous spectroscopic detection of laser-induced water Raman backscatter and fluorescence from chlorophyll a and other naturally occurring pigments p0253 A81-47647

Comparative measurements of stratospheric CH4 and CO concentrations with spectrograph and correlation radiometers p0217 A81-49433

NASA participation in the 1980 Persistent Elevated Pollution Episode/Northeast Regional Oxidant Study (PEPE/NROS) Project: Operational aspects [NASA-TM-83170] p0220 N81-32708

Quantification of non-point source sedimentation through densitometric analysis of color infrared aerial photography [PB81-209157] p0255 N81-33599

POLLUTION TRANSPORT

Aerospace remote sensing of the coastal zone for water quality and biotic productivity applications p0233 A81-43246

Drift and dispersion studies of ocean-dumped waste using Landsat imagery and current drogues p0233 A81-43539

Environmental measurements of power plant cooling tower and stack plumes [DOE/EV-02463/6] p0219 N81-30695

NASA participation in the 1980 Persistent Elevated Pollution Episode/Northeast Regional Oxidant Study (PEPE/NROS) Project: Operational aspects [NASA-TM-83170] p0220 N81-32708

Some methods of multitemporal analysis of LANDSAT images resulting from a study on Venice Lagoon [E81-10205] p0267 N81-33574

POTATOES

Integration and comparison of SAR and MSS data for potato crop area estimation p0203 A81-49766

POWER SPECTRA

Geomagnetic field mapping from a satellite: Spatial power spectra of the geomagnetic field at various satellite altitudes relative to natural noise sources and instrument noise [PUBL-1810] p0275 N81-29480

PRECAMBRIAN PERIOD

Ring structures of Precambrian shields, based on the interpretation of space imagery p0225 A81-42278

PRESSURE ICE

Radar detection of sea-ice ridges and icebergs in frozen oceans at incidence angles from 0 deg to 90 deg p0238 A81-49775

PROBABILITY DISTRIBUTION FUNCTIONS

Histogram estimation for multiple-detector sensors p0262 A81-48812

PROBABILITY THEORY

A capture-recapture approach for estimation of detection probabilities in aerial surveys p0258 A81-43546

Q

QUEBEC

Principal components enhancements versus classifications of Landsat images for forestry applications p0203 A81-49782

Use of Landsat images in the monitoring and study of the LG 2 reservoir during the filling period p0254 A81-49797

R

RADAR CROSS SECTIONS

Look direction dependence of radar backscattering cross section for agricultural fields p0199 A81-43741

Altimeter rain detection [NASA-TM-73291] p0275 N81-29408

RADAR DETECTION

Radar detection of sea-ice ridges and icebergs in frozen oceans at incidence angles from 0 deg to 90 deg p0238 A81-49775

RADAR GEOLOGY

Use of imaging radar for geology and archeology p0226 A81-43730

Applicability of airborne SAR data to geological mapping p0227 A81-49769

RADAR IMAGERY

Imaging ocean waves by synthetic aperture radars with long integration times p0231 A81-42026

Wave direction measured by four different systems p0232 A81-42622

The use of radar imagery for surface water investigations p0247 A81-43211

A preliminary analysis of SAR mapping of the Manitoba flood, May 1979 p0248 A81-43220

Use of imaging radar for geology and archeology p0226 A81-43730

Training site statistics from Landsat and Seasat satellite imagery registered to a common map base p0258 A81-43734

Use of Seasat satellite radar imagery for the detection of standing water beneath forest vegetation p0199 A81-43743

Texture measurements from Seasat - SAR images for urban land use interpretation p0214 A81-43749

A photo interpretation approach to forest regrowth monitoring using side-looking airborne radar - Grant County, Oregon p0200 A81-45428

A radar image time series p0226 A81-45430

Crop classification with a Landsat/radar sensor combination p0200 A81-46033

Radar image preprocessing --- of SEASAT-A SAR data p0272 A81-46038

The methodology of CIAT's land resource study of tropical America p0216 A81-46046

Spaceborne synthetic aperture radar for oceanography --- Book p0234 A81-46104

SAR ocean imaging mechanisms p0234 A81-46107

Detection of the Gulf Stream p0235 A81-46115

A search for cold water rings p0235 A81-46116

Tracking of a warm water ring p0235 A81-46117

Use of elevation models for landform analysis by Seasat-SAR imagery [IAF PAPER 81-98] p0260 A81-47349

Radar-optical-topographic transformations for scene content analysis p0261 A81-48552

Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings p0279 A81-49751

The integration of remote sensing in environmental decision making for the Maritimes p0217 A81-49752

The airborne SAR project - Conclusions and applications p0275 A81-49765

Integration and comparison of SAR and MSS data for potato crop area estimation p0203 A81-49766

Experimental use of real time SAR imagery in support of oil exploration in the Beaufort Sea p0227 A81-49767

An investigation of the autocorrelation function of radar images p0262 A81-49768

Applicability of airborne SAR data to geological mapping p0227 A81-49769

SAR image response over a conifer regeneration site p0203 A81-49770

Airborne impulse radar sounding of sea ice p0238 A81-49771

The Lake Melville/Labrador offshore synthetic aperture radar study - Winter 1979 p0238 A81-49772

Interpreter evaluations of airborne radar imagery for ecological and land/use cover classification in southern Manitoba p0218 A81-49773

Single and multiple parameter microwave signatures of sea ice p0238 A81-49774

SAR processing of partially coherent and sinusoidally dynamic ocean waves p0239 A81-49776

Digital image analysis of SAR imagery for the detection of icebergs p0239 A81-49777

Application of synthetic aperture radar data to snow cover monitoring p0253 A81-49778

Optimizing imaging radar parameters for ice reconnaissance p0239 A81-49779

Cartographic accuracy of synthetic aperture radar imagery p0262 A81-49780

Land use/cover mapping for Halifax County - Remote sensing alternatives p0218 A81-49783

Acquisition and preprocessing of images collected by future European Space Agency satellites p0263 A81-49814

Space based topographic mapping experiment using Seasat synthetic aperture radar and LANDSAT 3 return beam vidicon imagery [NASA-CR-164675] p0223 N81-30486

Seasat satellite investigation of the structure of western Nebraska and its application to the evaluation of geothermal resources [LA-UR-81-1454] p0223 N81-30505

Coherent and incoherent radar scattering from rough surfaces and vegetated areas - conferences [ESA-SP-166] p0206 N81-33339

Introduction to the workshop --- on coherent and incoherent radar scattering from rough surfaces and vegetated areas p0276 N81-33340

Imaging radar systems --- ocean surface imaging p0240 N81-33342

Optimal polarization concept in radar imaging --- electromagnetic scattering p0265 N81-33350

RADAR MAPS

Multisensor analysis of hydrologic features with emphasis on the Seasat SAR p0251 A81-43544

Utilisation and benefits of SLAR in operational ice data acquisition p0253 A81-49761

RADAR MEASUREMENT

The study of mesoscale ocean winds p0235 A81-46110

Radar methods for studying the earth --- Russian book p0273 A81-46924

RADAR SCATTERING

Satellite scatterometer p0232 A81-42102

Potential application of satellite radar to monitor soil moisture p0270 A81-43223

Aircraft active microwave measurements for estimating soil moisture p0271 A81-43547

Features of the radar detection of sea surface nonuniformities p0234 A81-43967

Aerosol sounding by means of aircraft-borne optical radar p0217 A81-49431

Radar altimeter waveform modeled parameter recovery --- SEASAT-1 data [NASA-TM-73294] p0275 N81-30325

Coherent and incoherent radar scattering from rough surfaces and vegetated areas --- conferences [ESA-SP-166] p0206 N81-33339

Sea surface scattering p0241 N81-33344

Wave orbital velocity, fade and SAR response to azimuth waves p0265 N81-33345

Scattering theory with application to synthetic aperture radar p0265 N81-33348

Scatterometer measurements on crop and soil surfaces p0206 N81-33349

Optimal polarization concept in radar imaging --- electromagnetic scattering p0265 N81-33350

Scatterometer calibration and data correction p0265 N81-33351

RADIANCE

Determination of moisture from NOAA polar orbiting satellite sounding radiances p0243 A81-41158

The effect of angular distribution models on the estimation of the earth's albedo p0269 A81-41915

A new numerical treatment of the source function in the radiative transfer equation --- for vertical atmospheric temperature and humidity profile retrieval from satellite radiance measurements p0269 A81-41916

On the analysis of remote sensing data to predict selected vegetative variables p0258 A81-43736

Atmospheric correction of Nimbus-7 Coastal Zone Color Scanner imagery p0271 A81-45879

Generation and use of digital elevation data for large areas p0221 A81-49811

Histogram estimation for multiple-detector sensors p0262 A81-49812

A comparative study of the thematic mapper and LANDSAT spectral bands from field measurement data [E81-10165] p0209 N81-33549

RADIATION DOSAGE

Remote sensing of soil radionuclide fluxes in a tropical ecosystem --- Eniwetok and Bikini A tolls [UCRL-84501] p0219 N81-29517

RADIATION TRANSPORT

Theoretical investigations concerning the measurement of the plankton concentration with the aid of satellites p0237 A81-49426

RADIATIVE TRANSFER

A new numerical treatment of the source function in the radiative transfer equation --- for vertical atmospheric temperature and humidity profile retrieval from satellite radiance measurements p0269 A81-41916

Requirements of space-borne microwave radiometers for detecting soil moisture contents p0270 A81-43225

Study of the influence of the atmosphere on the performance of an imaging microwave radiometer [ESA-CR(P)-1421] p0275 N81-30342

A study of the effects of the atmosphere on thematic mapper observations [E81-10056] p0276 N81-33540

RADIO ALTIMETERS

A comparison of Seasat 1 altimeter measurements of wave height with measurements made by a pitch-roll buoy p0231 A81-42066

Land subsidence measured by satellite radar altimetry p0270 A81-43260

Orbit determination requirements for TOPEX --- NASA ocean surface TOPography mapping EXperiment [AAS PAPER 81-158] p0221 A81-45828

Radar altimeter for ocean remote sensing [IAF PAPER 81-94] p0236 A81-47348

Altimeter rain detection [NASA-TM-73291] p0275 N81-29408

Radar altimeter waveform modeled parameter recovery --- SEASAT-1 data [NASA-TM-73294] p0275 N81-30325

Ice sheet altimetry [NASA-CR-156877] p0240 N81-31605

Gulf of Mexico satellite radar altimetry [NASA-TM-73295] p0224 N81-33760

RADIOACTIVE ISOTOPES

Remote sensing of soil radionuclide fluxes in a tropical ecosystem --- Eniwetok and Bikini A tolls [UCRL-84501] p0219 N81-29517

RADIOMETERS

Radiometry with nighttime DMSP images in digital form --- satellite earth observations p0260 A81-46402

Histogram estimation for multiple-detector sensors p0262 A81-49812

RADIOMETRIC RESOLUTION

Experience with the determination of optical image distortions of landscape elements on IR aerial photographs p0257 A81-41480

An examination of spectral band ratioing to reduce the topographic effect on remotely sensed data p0221 A81-45427

Inversion of multiwavelength radiometer measurements by three-dimensional filtering p0271 A81-45873

Atmospheric correction of Nimbus-7 Coastal Zone Color Scanner imagery p0271 A81-45879

Does the use of two radiometers correct for irradiance changes during measurements p0272 A81-46196

Generation and use of digital elevation data for large areas p0221 A81-49811

Histogram estimation for multiple-detector sensors p0262 A81-49812

Atmospheric correction to LANDSAT data for limonite discrimination p0228 N81-31594

RAIN

Insights into errors of SMS-inferred GATE convective rainfall p0243 A81-42095

Satellite applications in river and flood forecasting p0243 A81-43178

A satellite derived technique for estimating rainfall from thunderstorms and hurricanes p0244 A81-43191

Utilizing GOES imagery to determine convective storm characteristics in data deficient regions p0245 A81-43192

Rain estimation over several areas of the globe using satellite imagery p0245 A81-43193

A statistical approach to rainfall estimation using satellite data p0245 A81-43198

Altimeter rain detection [NASA-TM-73291] p0275 N81-29408

RAIN FORESTS

Rainforest species on large-scale color photos p0198 A81-43536

RAIN GAGES

Utilizing GOES imagery to determine convective storm characteristics in data deficient regions p0245 A81-43192

RAMAN SPECTRA

Airborne simultaneous spectroscopic detection of laser-induced water Raman backscatter and fluorescence from chlorophyll a and other naturally occurring pigments p0253 A81-47647

Use of water Raman emission to correct airborne laser fluorosensor data for effects of water optical attenuation p0253 A81-47676

RANGELANDS

Use of Landsat digital data to assist in mapping soils on Arizona rangelands p0201 A81-46047

Microdensitometry to identify saline rangelands on 70-mm color-infrared aerial film p0202 A81-46406

Colour - The critical photointerpretation element in the identification of rangeland plant communities on colour and colour-infrared aerial photography p0203 A81-49786

Spectral measurement of rangeland p0218 A81-49790

Remote sensing and land use planning p0218 A81-49792

Role of aerial photographs in classification of Landsat data p0262 A81-49808

Spectral properties of Arizona soils and rangelands and their relationship to LANDSAT digital data p0207 N81-31595

Dryland pasture and crop conditions as seen by HCMM [E81-10080] p0209 N81-33542

RECLAMATION

Remote methods and desert conservation --- Russian book p0213 A81-43523

RECREATION

Research on assessment of the recreational value of forests using Landsat digital data p0203 A81-49785

REFERENCE SYSTEMS

Selection of reference zones for the automatic coordinate control of space images p0261 A81-48693

REFLECTANCE

A comparison between two photographic methods for the determination of relative bidirectional reflectance p0259 A81-45431

Interpretation of hydrographic features seen in the waters off Cape Cod [AD-A102343] p0240 N81-31803

Derivation of shallow ocean bottom reflectance values from color aerial photography [AD-A101105] p0241 N81-33763

REFRACTED WAVES

Refraction of coastal ocean waves p0235 A81-46113

REFRACTIVITY

Mineralogical, optical, and geochemical properties of John H. Kerr Reservoir sediment samples for AgRISTARS pollution research [E81-10155] p0229 N81-33548

REGIONAL PLANNING

Resource inventory and terrain analysis in north western Manitoba from integrated remote sensing data p0218 A81-49803

REGRESSION ANALYSIS

Regression techniques for oceanographic parameter retrieval using space-borne microwave radiometry p0239 A81-49967

RELIABILITY ANALYSIS

Concerning the reliability estimation of information obtained from several sources in earth survey tasks p0270 A81-42286

A measure of reliability for classification of earth satellite data p0257 A81-42631

RELIEF MAPS

Analysis of the geometry of a frame photograph p0221 A81-42554

From landforms to avian habitat - A look at topology p0214 A81-43739

Stereoorthophotos as aids in the mapping of high mountain regions p0221 A81-46678

REMOTE REGIONS

Monitoring Canada's water resources in remote regions by satellite telemetry p0244 A81-43188

REMOTE SENSING

Some results on the investigation of earth resources by aerial and polygon methods --- Russian book p0269 A81-41476

Concerning the reliability estimation of information obtained from several sources in earth survey tasks p0270 A81-42286

Passive microwave techniques for geophysical sensing of the earth from satellites p0270 A81-43071

Radar methods for studying the earth --- Russian book p0273 A81-46924

Program and instrumentation of the satellite experiment Bulgaria-1300 II [IAF PAPER 81-91] p0273 A81-47345

AgRISTARS (Agriculture And Resources Inventory Surveys Through Aerospace Remote Sensing) DC/LC (Domestic Crops and Land Rover) project summary crop area estimates for Kansas and Iowa, 1980 [PB81-196909] p0207 N81-30511

Remote sensing for engineering site selection [AD-A102810] p0219 N81-32586

Experimental investigation of the physical fundamentals for remote sensing of soil and vegetation moisture by active infrared reflectance spectroscopy using CO2 laser technique [BMFT-FB-W-80-037] p0211 N81-33588

REQUIREMENTS
Reports on Marine Science Affairs. Report 14: Satellite data requirements for marine meteorological services
[WMO-548] p0239 N81-28668
RESERVOIRS
Use of Landsat images in the monitoring and study of the LG 2 reservoir during the filling period p0254 A81-49797
Mineralogical, optical, and geochemical properties of John H. Kerr Reservoir sediment samples for AgRISTARS pollution research
[E81-10155] p0229 N81-33548
RESOURCES MANAGEMENT
Commercial operations in space - 1980-2000; Proceedings of the Eighteenth Goddard Memorial Symposium, Washington, DC, March 27, 28, 1980 p0277 A81-44635
What does space remote sensing provide p0278 A81-47826
Agricultural water demand prediction using remote sensing technology for Georgia resource management
[PB81-184137] p0207 N81-30508
A selected bibliography: Remote sensing applications in wildlife management
[PB81-215881] p0211 N81-33598
RETURN BEAM VIDICONS
Geomorphic mapping from Landsat-3 Return Beam Vidicon /RBV/ imagery p0226 A81-46194
RIVER BASINS
The use of satellite data in predicting spring flow in the basins of the upper Ob' and upper Enisei p0243 A81-41723
Improving stream flow estimates through the use of Landsat p0247 A81-43216
Manual versus digital Landsat analysis for delineating river flooding p0252 A81-46405
The interrelation of linear and isometric objects on satellite imagery and the oil and gas structures of the Buzuluk Basin p0227 A81-48685
RIVERS
Roles of satellites in hydrology p0245 A81-43199
An examination of fluvial morphological characteristics of western Amazon streams from Apollo-Soyuz photographs p0247 A81-43212
Assessing the Red River of the North 1978 flooding from NOAA satellite data p0248 A81-43219
A preliminary analysis of SAR mapping of the Manitoba flood, May 1979 p0248 A81-43220
Remote sensing of dinoflagellate blooms in a turbid estuary p0251 A81-43538
Manual versus digital Landsat analysis for modeling river flooding p0252 A81-43745
ROCKY MOUNTAINS (NORTH AMERICA)
Landsat derived snow cover as an input variable for snow melt runoff forecasting in South Central Colorado p0248 A81-43206
RUN TIME (COMPUTERS)
Parallel processing implementations of a contextual classifier for multispectral remote sensing data p0272 A81-46028

S

SALINITY
Microwave radiometer measurement of tidally induced salinity changes off the Georgia coast p0232 A81-42067
Microdensitometry to identify saline rangelands on 70-mm color-infrared aerial film p0202 A81-48406
SALT BEDS
Optical and digital analyses of Landsat data depicting hydrogeological features of the Daryacheh-Ye-Namak area, Iran p0225 A81-43215
The possibility of using an aerial thermal survey for studying the structure of the salt bed in the Gulf of Kara-Bogaz-Gol p0226 A81-44061
Infrared imagery for studying the Kara-Bogaz-Gol Bay p0236 A81-48681
SAN FRANCISCO BAY (CA)
Use of ocean color scanner data in water quality mapping p0251 A81-43545
Water quality mapping from Landsat digital data p0252 A81-45429
SAN JOAQUIN VALLEY (CA)
Land subsidence measured by satellite radar altimetry p0270 A81-43260
SANDS
Determination of beach sand parameters using remotely sensed aircraft reflectance data p0217 A81-49346
SASKATCHEWAN
Rapeseed - Guidelines for operational monitoring p0203 A81-49784
Spectral measurement of rangeland p0218 A81-49790
SATELLITE DESIGN
Conceptual design of an automated mapping satellite System (MAPSAT)
[PB81-185555] p0264 N81-29522
Coastal Oceans Monitoring Satellite System (COMSS) system evaluation study
[ESS/SS-1035] p0239 N81-30168
SATELLITE NAVIGATION SYSTEMS
Satellite aided coastal zone monitoring and vessel traffic system p0231 A81-41755
SATELLITE NETWORKS
Optimization of Doppler measurements in the satellite network of Eastern Europe p0221 A81-48678
Commercial applications of satellite oceanography p0237 A81-49133
The remote sensing satellite program of the European Space Agency p0279 A81-49762
SATELLITE OBSERVATION
A new numerical treatment of the source function in the radiative transfer equation --- for vertical atmospheric temperature and humidity profile retrieval from satellite radiance measurements p0269 A81-41916
Passive microwave techniques for geophysical sensing of the earth from satellites p0270 A81-43071
Remote sensing in hydrology - A challenge to scientists p0243 A81-43177
Physical and technical foundations for the development of subsatellite systems for the exploration of natural earth resources
[IAF PAPER 81-101] p0278 A81-47350
Reports on Marine Science Affairs. Report 14: Satellite data requirements for marine meteorological services
[WMO-548] p0239 N81-28668
SATELLITE ORBITS
Particular features of the ocean glitter pattern observed from a sun-synchronous orbit p0234 A81-45436
Orbit determination requirements for TOPEX --- NASA ocean surface TOPography mapping EXperiment
[AAS PAPER 81-158] p0221 A81-45828
SATELLITE SOUNDING
Determination of moisture from NOAA polar orbiting satellite sounding radiances p0243 A81-41158
Application of the truncated normal distribution technique to the derivation of sea surface temperatures p0234 A81-45881
Remote sounding of atmosphere and ocean for climate research /Appleton Lecture/ p0236 A81-47099
New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300'
[IAF PAPER 81-212] p0273 A81-47407
SATELLITE TELEVISION
Measurement of lengths, angles, and areas on the earth's spheroid p0221 A81-42846
Analysis of the November 23, 1980 earthquake as a design basis for satellite emergency communication
[IAF PAPER 81-269] p0216 A81-47433
SATELLITE-BORNE INSTRUMENTS
Performance evaluation of a spaceborne scatterometer p0269 A81-41920
Remote sensing of oceanic phytoplankton - Present capabilities and future goals p0232 A81-42215
Concerning the reliability estimation of information obtained from several sources in earth survey tasks p0270 A81-42286
Calibration validation for the GEOS 3 altimeter p0270 A81-42871
Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979 p0243 A81-43176
Corps of Engineers utilization of satellites for hydrologic purposes p0244 A81-43180
Satellite versus conventional methods in hydrology p0244 A81-43183
Advanced technology for satellite data collection systems p0270 A81-43190
Data collection and location by satellite - The Argos system
[IAF PAPER 81-80] p0273 A81-47338
The first ESA remote sensing satellite /ERS/ - The programme and the system
[IAF PAPER 81-90] p0236 A81-47344
Program and instrumentation of the satellite experiment Bulgaria-1300 II
[IAF PAPER 81-91] p0273 A81-47345
SPOT status of development
[IAF PAPER 81-92] p0278 A81-47346
An atmospheric study by 'Spectrum-15' onboard of the Salyut-6 orbital station
[IAF PAPER 81-120] p0216 A81-47359
New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300'
[IAF PAPER 81-212] p0273 A81-47407
First results of the Intercosmos satellite IK-21
[IAF PAPER 81-214] p0274 A81-47409
The SPOT satellite mission, applications aspects and data products p0278 A81-48549
Satellites for oceanography - The promises and the realities p0237 A81-49126
Coastal Oceans Monitoring Satellite System (COMSS) system evaluation study
[ESS/SS-1035] p0239 N81-30168
SATELLITE-BORNE PHOTOGRAPHY
Hurricane 'Flossie' /September 1978/ observed in the north Atlantic, by the Meteosat satellite p0213 A81-41061
Aerial data acquisition systems using test-ground polygons p0269 A81-41477
The possibilities of the automated classification of agricultural objects on the basis of their multispectral aerial-spaceborne images p0197 A81-41488
Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects p0197 A81-41489
The use of spaceborne photography for topographic mapping p0221 A81-42556
An introduction to satellite hydrology p0244 A81-43184
Remote sensing of coastal pollutants using multispectral data p0233 A81-43245
Aerospace remote sensing of the coastal zone for water quality and biotic productivity applications p0233 A81-43246
Mapping irrigated cropland on the High Plains using Landsat p0198 A81-43266
Skylab in retrospect p0277 A81-43635
Simulation of orbital image-sensor geometry p0260 A81-46192
Manual versus digital Landsat analysis for delineating river flooding p0252 A81-46405
Large-area histograms from Meteosat images p0260 A81-46917
Derivation of formulas for the correlation of coordinate points of different-scale photographs and quasi-photographs p0261 A81-48772
SATELLITE-BORNE RADAR
Detection of the Gulf Stream p0235 A81-46115
Radar methods for studying the earth --- Russian book p0273 A81-46924
SATELLITE-TO-SATELLITE TRACKING
Satellite To Satellite Doppler Tracking (SSDT) for mapping of the Earth's gravity field
[NASA-CR-164722] p0223 N81-31601
SCANNERS
The characteristics of combining devices with different survey bands aboard a satellite p0274 A81-48689
Geometric correction of scanner images of the earth's surface p0261 A81-48694
SCATTEROMETERS
Performance evaluation of a spaceborne scatterometer p0269 A81-41920
Coherent and incoherent radar scattering from rough surfaces and vegetated areas --- conferences
[ESA-SP-166] p0208 N81-33339
Scatterometer calibration and data correction p0265 N81-33351
SCENE ANALYSIS
Procedure 1 and forestland classification using Landsat data p0201 A81-46055
Radar-optical-topographic transformations for scene content analysis p0261 A81-48552
Evaluation of Thematic Mapper bands - A first step in feature selection p0206 A81-49815
LANDSAT C workshop field/laboratory exercises p0280 N81-32571
SCOTLAND
Current resource mapping and environmental monitoring applications using Landsat MSS data in Scotland p0218 A81-49806
SEA ICE
Evaluation of the effect of sea-ice roughness on the microwave emission of the ice p0231 A81-41490
Sea ice detection using enhanced infrared satellite data p0232 A81-42131
Operational use of satellite imagery in the Canadian ice program p0238 A81-49754
The use of satellite imagery as an aid to the Canadian Coast Guard ice operations p0238 A81-49758
Experimental use of real time SAR imagery in support of oil exploration in the Beaufort Sea p0227 A81-49767
Airborne impulse radar sounding of sea ice p0238 A81-49771
The Lake Melville/Labrador offshore synthetic aperture radar study - Winter 1979 p0238 A81-49772
Single and multiple parameter microwave signatures of sea ice p0238 A81-49774
Optimizing imaging radar parameters for ice reconnaissance p0239 A81-49779
Study of the influence of the atmosphere on the performance of an imaging microwave radiometer
[ESA-CR(P)-1421] p0275 N81-30342
A review of volume scatter theories for modeling applications p0265 N81-33347
Comparative analysis of sea ice features using Side-Looking Airborne Radar (SLAR) and LANDSAT imagery --- Beaufort Sea and Bering Sea
[E81-10044] p0241 N81-33539
SEA ROUGHNESS
Radar altimeter waveform modeled parameter recovery --- SEASAT-1 data
[NASA-TM-73294] p0275 N81-30325
SEA STATES
Imaging ocean waves by synthetic aperture radars with long integration times p0231 A81-42026
The promise of satellite altimetry --- for oceanography p0237 A81-49128
Gulf of Mexico satellite radar altimetry
[NASA-TM-73295] p0224 N81-33760
SEA TRUTH
A comparison of Seasat 1 altimeter measurements of wave height with measurements made by a pitch-roll buoy p0231 A81-42068
Wave direction measured by four different systems p0232 A81-42622
SEA WATER
An analysis of the data of synchronous measurements from the Meteor satellite and ships at the eastern coast of the Caspian Sea p0237 A81-48687

Compact and highly sensitive fluorescence lidar for oceanographic measurements p0237 A81-49378

SEAS

Fitoexomorphogenic analysis of geological environment changes in the South Aral Sea, based on aerial and space imagery p0225 A81-42279

SEASAT SATELLITES

Seasat data applications by commercial users p0231 A81-41974

SEAWEEDS

Multispectral kelp resource surveys p0232 A81-43244

SEDIMENT TRANSPORT

An examination of fluvial morphological characteristics of western Amazon streams from Apollo-Soyuz photographs p0247 A81-43212

Southern Chesapeake Bay circulation and suspended sediment transport analyzed using Landsat imagery p0252 A81-43747

SEDIMENTS

Bay of Fundy verification of a system for multidate Landsat measurement of suspended sediment p0250 A81-43254

Remote sensing of dinoflagellate blooms in a turbid estuary p0251 A81-43538

Mineralogical, optical, and geochemical properties of John H. Kerr Reservoir sediment samples for AgRISTARS pollution research [E81-10155] p0229 N81-33548

A study of Minnesota land and water resources using remote sensing, Volume 14 [E81-10166] p0254 N81-33550

Lakewide monitoring of suspended solids using satellite data --- Lake Superior water reclamation p0254 N81-33552

Quantification of non-point source sedimentation through densitometric analysis of color infrared aerial photography [PB81-209157] p0255 N81-33599

SEISMOLOGY

Space research on seismic regions p0225 A81-42280

Optimal polarization concept in radar imaging --- electromagnetic scattering p0265 N81-33350

SHALLOW WATER

Trophic state determination for shallow coastal lakes from Landsat imagery p0251 A81-43259

SHEAR FLOW

Method for estimation of ocean current velocity from satellite images p0231 A81-41350

SHIPS

Satellite aided coastal zone monitoring and vessel traffic system p0231 A81-41755

SHOALS

Interpretation of hydrographic features seen in the waters off Cape Cod [AD-A102343] p0240 N81-31803

SHORELINES

Mapping the Great Salt Lake shoreline and associated waterfowl habitat from Landsat data p0252 A81-43742

A remote sensing technique to monitor Cladophora in the Great Lakes [PB81-173841] p0254 N81-29520

SIBERIA

The use of satellite data in predicting spring flow in the basins of the upper Ob' and upper Enisei p0243 A81-41723

Soviet remote sensing of the earth's resources and interpretation of space data with reference to the Caspian Sea, Siberia and the Arctic Ocean [IAF PAPER 81-112] p0278 A81-47355

SIDE-LOOKING RADAR

Iceberg detectability problems using SAR and SLAR systems p0232 A81-43206

A photo interpretation approach to forest regrowth monitoring using side-looking airborne radar - Grant County, Oregon p0200 A81-45428

A radar image time series p0226 A81-45430

Utilisation and benefits of SLAR in operational ice data acquisition p0253 A81-49761

SIERRA NEVADA MOUNTAINS (CA)

Satellite snow mapping techniques with emphasis on the use of Landsat p0245 A81-43200

Application of snow covered area to runoff forecasting, in the Sierra Nevada, California p0245 A81-43201

Remote sensing aided procedure for conifer growth modeling in the northeastern Sierra Nevada p0199 A81-43740

SIGNAL DISTORTION

Experience with the determination of optical image distortions of landscape elements on IR aerial photographs p0257 A81-41480

SIGNAL PROCESSING

Some methods of multitemporal analysis of LANDSAT images resulting from a study on Venice Lagoon [E81-10205] p0267 N81-33574

SIGNAL TO NOISE RATIOS

The signal-to-noise ratio of a space photographic system p0269 A81-42284

SIGNATURE ANALYSIS

Comparison of Landsat-2 and field spectrometer reflectance signatures of south Texas rangeland plant communities p0201 A81-46034

Why surface-truth field study is needed in remote-sensing instruction p0280 N81-32567

SITE SELECTION

The use of CIR and airborne multispectral scanner techniques for wetland soils mapping of highway corridors p0215 A81-46044

Remote sensing for engineering site selection [AD-A102810] p0219 N81-32586

The development of a remote sensing applications program for Vermont [E81-10148] p0266 N81-33547

Cornell University Remote Sensing Program [E81-10174] p0255 N81-33560

SKYLAB PROGRAM

Skylab in retrospect p0277 A81-43535

SLOPES

Topographic slope correction for analysis of thermal infrared images [PB81-211781] p0224 N81-33589

SNOW COVER

The use of satellite data in predicting spring flow in the basins of the upper Ob' and upper Enisei p0243 A81-41723

Satellite applications in river and flood forecasting p0243 A81-43178

Satellite snow mapping techniques with emphasis on the use of Landsat p0245 A81-43200

Application of snow covered area to runoff forecasting, in the Sierra Nevada, California p0245 A81-43201

The satellite record of the winter of 1978-79 in North America p0246 A81-43203

Prediction of water yield using satellite imagery and a snowmelt simulation model p0246 A81-43205

Passive microwave sensing of snow characteristics over land p0246 A81-43207

Landsat derived snow cover as an input variable for snow melt runoff forecasting in South Central Colorado p0246 A81-43208

Monitoring snow with microwaves p0246 A81-43209

Operational use of satellite data for snow inventory and runoff forecast p0248 A81-43210

Flood applications of satellite imagery p0247 A81-43217

Correlation function studies for snow and ice p0260 A81-46378

Angular anisotropy of reflection from various types of underlying surface. I - Snow cover. II - Desert p0260 A81-47007

Passive microwave systems [IAF PAPER 81-88] p0273 A81-47342

Monitoring of snow covered area using satellite data [IAF PAPER 81-114] p0253 A81-47356

Landsat observations of snowcover depletion and flooding in the Chesapeake Bay area during the winter of 1979 p0253 A81-48942

Landsat - What is operational in water resources p0253 A81-49757

Application of synthetic aperture radar data to snow cover monitoring p0253 A81-49778

Computer analysis of Tiros-N/NOAA-6 satellite data for operational snow cover mapping p0262 A81-49795

Investigation of multispectral remote sensing of snow cover using a solar radiation model p0267 A81-49804

Current resource mapping and environmental monitoring applications using Landsat MSS data in Scotland p0218 A81-49806

Satellite monitoring of snow extent and condition in agricultural, transitional, and forested land cover areas [PB81-188625] p0254 N81-30509

A review of volume scatter theories for modeling applications p0265 N81-33347

SOCIAL FACTORS

Large scale human benefits of space industrialization p0277 A81-42513

SOIL EROSION

An application of Landsat and computer technology to potential water pollution from soil erosion p0250 A81-43253

Remote sensing of bank erosion along the Missouri River, South Dakota p0213 A81-43263

A case study of soil erosion detection by digital analysis of the remotely sensed multispectral Landsat scanner data of a semi-arid land in southern India p0201 A81-46050

Suburban soil loss and runoff simulation assisted by interpretation of large scale aerial photography p0253 A81-48941

SOIL MAPPING

Using Landsat MSS data with soils information to identify wetland habitats p0249 A81-43236

Application of multispectral reflectance studies of soils - Pre-Landsat p0200 A81-46031

Stratification of Landsat data by uniformity productivity of soils p0259 A81-46042

Interactive processing of Landsat image for morphopedological studies p0259 A81-46043

The use of CIR and airborne multispectral scanner techniques for wetland soils mapping of highway corridors p0215 A81-46044

Mapping alpine soils using color positive and color infrared photographs p0252 A81-46045

Use of Landsat digital data to assist in mapping soils on Arizona rangelands p0201 A81-46047

Development of a digital data base for reflectance-related soil information p0201 A81-46051

Suburban soil loss and runoff simulation assisted by interpretation of large scale aerial photography p0253 A81-48941

Operational applications for analysis of agricultural crops and cultural practices p0203 A81-49756

Evaluation of Thematic Mapper bands - A first step in feature selection p0205 A81-49815

Spectral properties of Arizona soils and rangelands and their relationship to LANDSAT digital data p0207 N81-31596

Landform-vegetation relationships in the northern Chihuahuan Desert [AD-A102896] p0208 N81-32588

SOIL MOISTURE

Satellite applications in river and flood forecasting p0243 A81-43178

NASA water resources/hydrology remote sensing program in the 1980's p0244 A81-43179

Agricultures's needs related to satellite hydrology p0197 A81-43181

Passive microwave sensing of snow characteristics over land p0246 A81-43207

Survey of in-situ and remote sensing methods for soil moisture determination p0197 A81-43221

Characteristics of microwave emission of significance to satellite remote sensing of soil water p0258 A81-43222

Potential application of satellite radar to monitor soil moisture p0270 A81-43223

Soil moisture applications of the heat capacity mapping mission p0197 A81-43224

Requirements of space-borne microwave radiometers for detecting soil moisture contents p0270 A81-43225

Ground water applications of the heat capacity mapping mission p0248 A81-43233

A multistage mapping approach for an irrigated croplands inventory p0198 A81-43262

Aircraft active microwave measurements for estimating soil moisture p0271 A81-43547

Look direction dependence of radar backscattering cross section for agricultural fields p0199 A81-43741

Active microwave measurements for estimating soil moisture in Oklahoma p0199 A81-43744

Preliminary survey of HCMM satellite thermal imagery as applied to hydrospherics p0252 A81-43746

Thermal inertia mapping of some areas of Quebec based on aerial and HCMM satellite data p0204 A81-49799

Evaluation of gravimetric ground truth soil moisture data collected for the agricultural soil moisture experiment, 1978 Colby, Kansas, aircraft mission [E81-10114] p0205 N81-29494

Soil moisture inferences from thermal infrared measurements of vegetation temperatures [E81-10184] p0206 N81-29500

The environmental vegetation index: A tool potentially useful for arid land management --- Texas and Mexico, plant growth stress due to water deficits [E81-10191] p0206 N81-29506

Descriptive and sensitivity analyses of WATBALI: A dynamic soil water model [E81-10193] p0206 N81-29507

Landform-vegetation relationships in the northern Chihuahuan Desert [AD-A102896] p0208 N81-32588

Scatterometer measurements on crop and soil surfaces p0208 N81-33349

Dryland pasture and crop conditions as seen by HCMM [E81-10080] p0209 N81-33542

Measurement of soil moisture trends with airborne scatterometers --- Texas [E81-10088] p0209 N81-33545

A study of Minnesota land and water resources using remote sensing, Volume 14 [E81-10166] p0254 N81-33550

A project to evaluate moisture stress and phenological factors in corn and soybean areas of southwestern and south-central Minnesota p0209 N81-33554

A crop moisture stress index for large areas and its application in the prediction of spring wheat phenology [E81-10202] p0210 N81-33573

Experiment plan: Row and roughness effects on dependence of active microwave measurements of soil moisture [E81-10208] p0211 N81-33575

Experimental investigation of the physical fundamentals for remote sensing of soil and vegetation moisture by active infrared reflectance spectroscopy using CO2 laser technique [BMFT-FB-W-80-037] p0211 N81-33588

SOIL SCIENCE

Machine processing of remotely sensed data and soil information systems and remote sensing and soil survey; Proceedings of the Sixth Annual Symposium, Purdue University, West Lafayette, IN, June 3-6, 1980 p0200 A81-46026

SOILS

Microdensitometry to identify saline rangelands on 70-mm color-infrared aerial film p0202 A81-46406

Remote sensing of soil radionuclide fluxes in a tropical ecosystem --- Eniwetok and Bikini Atolls [UCRL-84501] p0219 N81-29517

Synergistic relationships among remote-sensing and geophysical media: Geological and hydrological applications --- detecting near-surface ground water in Minnesota p0255 N81-33553

SOLAR FLUX DENSITY

Radiation studies in the atmosphere p0216 A81-47001

SOLAR RADIATION
Investigation of multispectral remote sensing of snow cover using a solar radiation model p0262 A81-49604
Effect of forest canopy closure on incoming solar radiance
[E81-10170] p0205 N81-28499
SOUTH AMERICA
The methodology of CIAT's land resource study of tropical America p0216 A81-46046
SOUTH DAKOTA
Soil moisture applications of the heat capacity mapping mission p0197 A81-43224
Landsat data for locating shallow glacial aquifers in eastern South Dakota p0226 A81-43228
Ground water applications of the heat capacity mapping mission p0248 A81-43233
Landsat interpretation of prairie lakes and wetlands of eastern South Dakota p0249 A81-43240
Remote sensing of bank erosion along the Missouri River, South Dakota p0213 A81-43263
SOUTHERN CALIFORNIA
Multispectral kelp resource surveys p0232 A81-43244
Satellite detection of oil on the marine surface p0233 A81-43251
Land subsidence measured by satellite radar altimetry p0270 A81-43260
SOVEREIGNTY
International monitoring from space /Problems of international law/ --- Russian book p02?9 A81-49468
SOYBEANS
Relating ground level reflected radiance measurements in the Landsat MSS bandpasses to satellite altitudes p0271 A81-43735
On the analysis of remote sensing data to predict selected vegetative variables p0258 A81-43736
An assessment of Landsat data acquisition history on identification and area estimation of corn and soybeans p0200 A81-46032
Users manual for the US baseline corn and soybean segment classification procedure
[E81-10190] p0206 N81-29504
AgRISTARS (Agriculture And Resources Inventory Surveys Through Aerospace Remote Sensing) DC/LC (Domestic Crops and Land Rover) project summary crop area estimates for Kansas and Iowa, 1980
[PB81-196909] p0207 N81-30611
Crop area estimates using ground-gathered and LANDSAT data. A multitemporal approach: Missouri, 1979
[PB81-186751] p0208 N81-31614
A project to evaluate moisture stress and phenological factors in corn and soybean areas of southwestern and south-central Minnesota p0209 N81-33554
SPACE INDUSTRIALIZATION
Large scale human benefits of space industrialization p0277 A81-42513
SPACE PLASMAS
New complex for ionosphere-magnetosphere study Intercosmos-Bulgaria-1300
[IAF PAPER 81-212] p0273 A81-47407
SPACE PLATFORMS
Passive microwave systems
[IAF PAPER 81-88] p0273 A81-47342
SPACE SHUTTLE ORBITERS
First Shuttle payload loading to begin p0273 A81-48461
SPACE SHUTTLE PAYLOADS
Earth applications orbit analysis for a shuttle-mounted Multispectral Mapper
[AAS PAPER 81-182] p0271 A81-45836
SPACE SHUTTLES
Commercial operations in space - 1980-2000; Proceedings of the Eighteenth Goddard Memorial Symposium, Washington, DC, March 27, 28, 1980 p0277 A81-44635
SPACEBORNE EXPERIMENTS
Main tasks and methods of operational planning of experiments concerning the observations of the earth from space p0277 A81-42288
SPACEBORNE PHOTOGRAPHY
Space research on seismic regions p0225 A81-42280
Remote sensing and mapping of pastures p0213 A81-42281
The signal-to-noise ratio of a space photographic system p0269 A81-42284
An examination of fluvial morphological characteristics of western Amazon streams from Apollo-Soyuz photographs p0247 A81-43212
Application of digital terrain data to quantify and reduce the topographic effect on Landsat data p0259 A81-45433
Land use mapping of Hong Kong from Landsat images - An evaluation p0215 A81-45434
SPACECRAFT COMMUNICATION
Analysis of the November 23, 1980 earthquake as a design basis for satellite emergency communication
[IAF PAPER 81-269] p0216 A81-47433
SPACELAB PAYLOADS
The remote sensing satellite program of the European Space Agency p0279 A81-49762
SPATIAL DISTRIBUTION
Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects p0197 A81-41489
Spatial evolution of ocean wave spectra p0235 A81-46112
Research on assessment of the recreational value of forests using Landsat digital data p0203 A81-49785
Development of advanced acreage estimation methods
[E81-10160] p0206 N81-29495
The multicategory case of the sequential Bayesian pixel selection and estimation procedure
[E81-10182] p0263 N81-29498
Estimation of proportions in mixed pixels through their region characterization
[E81-10199] p0264 N81-29510
SPATIAL RESOLUTION
A measure of reliability for classification of earth satellite data p0257 A81-42631
Geomagnetic field mapping from a satellite: Spatial power spectra of the geomagnetic field at various satellite altitudes relative to natural noise sources and instrument noise
[PUBL-1810] p0275 N81-29480
SPECKLE PATTERNS
Fourier modulus image construction
[AD-A101728] p0264 N81-30723
SPECTRAL BANDS
Multispectral texture analysis p0257 A81-41055
Training site statistics from Landsat and Seasat satellite imagery registered to a common map base p0258 A81-43734
Waveband evaluation of proposed thematic mapper in forest cover classification p0199 A81-43738
An examination of spectral band ratioing to reduce the topographic effect on remotely sensed data p0221 A81-45427
Procedures for change detection using Landsat digital data p0215 A81-45437
Application of multispectral reflectance studies of soils - Pre-Landsat p0200 A81-46031
Advanced synthetic aperture radar for remote sensing p0274 A81-48553
The characteristics of combining devices with different survey bands aboard a satellite p0274 A81-48689
Evaluation of Thematic Mapper bands - A first step in feature selection p0205 A81-49815
A comparative study of the thematic mapper and LANDSAT spectral bands from field measurement data
[E81-10165] p0209 N81-33549
SPECTRAL EMISSION
Concerning the possibility of improving the spectroradiometric accuracy of remote sensing of the earth by means of multispectral band scanners p0270 A81-42285
SPECTRAL RECONNAISSANCE
Methods development and applications evaluations of NURE aerial reconnaissance survey data for uranium resource evaluation: Beeville/Bay City and Crystal City quadrangles, Texas
[GJBX-69(81)] p0228 N81-30502
Airborne gamma-ray spectrometer and magnetometer survey: Canyon City quadrangle (Oregon), volume 2
[DE81-028682] p0229 N81-33584
Airborne gamma-ray spectrometer and magnetometer survey, Salem quadrangle (Oregon), volume 2
[DE81-028681] p0229 N81-33585
SPECTRAL REFLECTANCE
Relating ground level reflected radiance measurements in the Landsat MSS bandpasses to satellite altitudes p0271 A81-43735
The effect of sensor bandpass and spectral response in crop stress detection p0199 A81-43737
Features of the radar detection of sea surface nonuniformities p0234 A81-43967
Application of multispectral reflectance studies of soils - Pre-Landsat p0200 A81-46031
Comparison of Landsat-2 and field spectrometer reflectance signatures of south Texas rangeland plant communities p0201 A81-46034
Development of a digital data base for reflectance-related soil information p0201 A81-46051
Does the use of two radiometers correct for irradiance changes during measurements p0272 A81-46196
Correlation between integral and spectral albedos of clouds over water surfaces p0235 A81-47004
Angular anisotropy of reflection from various types of underlying surface. I - Snow cover. II - Desert p0260 A81-47007
Assessing winter wheat dry matter production via spectral reflectance measurements p0202 A81-49344
Determination of beach sand parameters using remotely sensed aircraft reflectance data p0217 A81-49346
Spectral measurement of rangeland p0218 A81-49790
The discrimination of cereal crops and legumes using reflectance data in the Landsat bandpasses p0204 A81-49794
Investigation of multispectral remote sensing of snow cover using a solar radiation model p0262 A81-49804
Spectral properties of Arizona soils and rangelands and their relationship to LANDSAT digital data p0207 N81-31595
Visual enhancement of images of natural resources: Applications in geology
[E81-10181] p0228 N81-32575
Comparison of laboratory reflectance spectra and LANDSAT multispectral images of Hawaiian lava flows
[E81-10061] p0266 N81-33541
Cornell University Remote Sensing Program
[E81-10174] p0255 N81-33560
SPECTRAL RESOLUTION
Computer analysis of Tiros-N/NOAA-6 satellite data for operational snow cover mapping p0262 A81-49795
A simulation of Thematic Mapper performance in an agricultural application p0204 A81-49810
SPECTRAL SENSITIVITY
Integration and comparison of SAR and MSS data for potato crop area estimation p0203 A81-49766
An analysis of haze effects on LANDSAT multispectral scanner data
[E81-10162] p0263 N81-29497
A comparative study of the thematic mapper and LANDSAT spectral bands from field measurement data
[E81-10165] p0209 N81-33549
SPECTRAL SIGNATURES
Multispectral kelp resource surveys p0232 A81-43244
Maximum likelihood estimation of label imperfection probabilities and its use in the identification of mislabeled patterns --- with application to Landsat MSS data processing p0259 A81-46040
A temporal/spectral analysis of small grain crops and confusion crops --- North Dakota
[E81-10167] p0205 N81-28498
A description of the reformatted spring small grains labeling procedure used in test 2, part 2 of the US/Canada wheat and barley exploratory experiment
[E81-10206] p0207 N81-31597
Classification of wheat: Badhwar profile similarity technique
[E81-10207] p0207 N81-31598
Synergistic relationships among remote-sensing and geophysical media: Geological and hydrological applications --- detecting near-surface ground water in Minnesota p0255 N81-33553
SPECTROPHOTOMETRY
Investigation of the efficiency of the optical sounding of aerosol by the use of spectral photometers p0215 A81-45406
SPECTRORADIOMETERS
A radiometric model of an earth radiation budget radiometer optical system with diffuse-specular surfaces p0269 A81-41919
Concerning the possibility of improving the spectroradiometric accuracy of remote sensing of the earth by means of multispectral band scanners p0270 A81-42285
A comparative study of the thematic mapper and LANDSAT spectral bands from field measurement data
[E81-10165] p0209 N81-33549
SPECTRUM ANALYSIS
Multispectral texture analysis p0257 A81-41055
Spectral properties of Arizona soils and rangelands and their relationship to LANDSAT digital data p0207 N81-31595
SPECULAR REFLECTION
A comparison between two photographic methods for the determination of relative bidirectional reflectance p0259 A81-45431
Particular features of the ocean glitter pattern observed from a sun-synchronous orbit p0234 A81-45436
A model of plant canopy polarization response p0201 A81-46035
SPHEROIDS
Measurement of lengths, angles, and areas on the earth's spheroid p0221 A81-42846
SPOT (FRENCH SATELLITE)
SPOT status of development
[IAF PAPER 81-92] p0278 A81-47346
Image quality for SPOT satellite - Specifications and budget
[IAF PAPER 81-104] p0261 A81-47352
The SPOT satellite mission, applications aspects and data products p0278 A81-48549
SPREAD REFLECTION
ISS-b experimental results on global distributions of ionospheric parameters and thunderstorm activity p0215 A81-44862
SPRINGS (WATER)
Applications of aerospace data for detection of submarine springs in Jamaica p0226 A81-43232
Satellite observations of a geothermal submarine spring off Florida west coast p0233 A81-43248
The detection of groundwater discharges /springs/ using aerial thermography p0254 A81-49800
STATISTICAL ANALYSIS
A capture-recapture approach for estimation of detection probabilities in aerial surveys p0258 A81-43546
Alternative 'scale up' estimators for aerial surveys where both detection and classification errors exist p0260 A81-46197
STATISTICAL CORRELATION
Correlation function studies for snow and ice p0260 A81-46378
STATISTICAL DISTRIBUTIONS
Context distribution estimation for contextual classification of multispectral image data p0259 A81-46041
STATISTICAL WEATHER FORECASTING
A statistical approach to rainfall estimation using satellite data p0245 A81-43198

STEREOPHOTOGRAPHY
Determination of the external-orientation elements of single photographs and stereopairs p0257 A81-42555
Stereoorthophotos as aids in the mapping of high mountain regions p0221 A81-46678
SPOT status of development [IAF PAPER 81-92] p0278 A81-47348
The SPOT satellite mission, applications aspects and data products p0278 A81-48549
Derivation of formulas for the correlation of coordinate points of different-scale photographs and quasi-photographs p0261 A81-48772
The influence of the accuracy of determining the elements of the external orientation of a stereopair on the processing of aerial photographs on the basis of adjusting elements p0261 A81-48773

STEREOSCOPY
Derivation of formulas for the correlation of coordinate points of different-scale photographs and quasi-photographs p0261 A81-48772

STORMS
Utilizing GOES imagery to determine convective storm characteristics in data deficient regions p0245 A81-43192

STRATIFICATION
Stratification of Landsat data by uniformity productivity of soils p0259 A81-46042
The multicategory case of the sequential Bayesian pixel selection and estimation procedure [E81-10182] p0263 N81-29498

STRATOSPHERE
Stratospheric sulfate from the Gareloi eruption, 1980 - Contribution to the 'ambient' aerosol by a poorly documented volcanic eruption p0213 A81-41404
Measurements of CF2Cl2, CFCl3, and N2O in the lower stratosphere between 2 deg S and 73 deg N latitude p0214 A81-44515
The distribution of the trace gases H2O, NO2, and HNO3 in the middle atmosphere on the basis of LIMS measurements --- Limb Infrared Monitor of Stratosphere p0217 A81-49407
Comparative measurements of stratospheric CH4 and CO concentrations with spectrograph and correlation radiometers p0217 A81-49433

STRIP MINING
Detection of changes in a coal surface mining area by ratioing multidate Landsat digital data p0228 A81-49809

STRUCTURAL BASINS
Observations on Lake Ontario basin hydrogeology from optical enhancements of Landsat imagery p0248 A81-43231
Dynamic ecosystem of the Aral Basin studied from satellite imagery p0217 A81-48682

STRUCTURAL PROPERTIES (GEOLOGY)
Correlation of geologic structure inferred from computer enhanced Landsat imagery with underground water supplies in Arizona p0225 A81-43227
Lineament mapping in northern Sweden from Landsat images using orthogonal image transforms p0226 A81-46039
Geomorphic mapping from Landsat-3 Return Beam Vidicon /RBV/ imagery p0226 A81-46194
Ore-controlling space geological objects and their assessment techniques applied to mineral prediction [IAF PAPER 81-107] p0227 A81-47353
The interrelation of linear and isometric objects on satellite imagery and the oil and gas structures of the Buzuluk Basin p0227 A81-48685
Complex processing of satellite images and the geological interpretation p0227 A81-48690
Lineaments - Problems and directions of studies by means of aerial and space tools and methods p0221 A81-48696
Geological and terrain analysis of the Annapolis County region of Nova Scotia - An application of digital Landsat, radar and colour infrared data p0227 A81-49802
Seasat satellite investigation of the structure of western Nebraska and its application to the evaluation of geothermal resources [LA-UR-81-1454] p0223 N81-30505

SUBARCTIC REGIONS
Digital enhancements for vegetation mapping in a subarctic environment p0262 A81-49793

SUBSIDENCE
Land subsidence measured by satellite radar altimetry p0270 A81-43260

SUBURBAN AREAS
Suburban soil loss and runoff simulation assisted by interpretation of large scale aerial photography p0253 A81-48941

SUDAN
Comparative experimental study on the use of original and compressed multispectral Landsat data of the Bayuda desert p0262 A81-49813

SUNLIGHT
A comparison of observed and analytically derived remote sensing penetration depths for turbid water [NASA-TM-83176] p0255 N81-33577

SURFACE LAYERS
Survey of in-situ and remote sensing methods for soil moisture determination p0197 A81-43221

SURFACE NAVIGATION
Satellite aided coastal zone monitoring and vessel traffic system p0231 A81-41755
Operational use of satellite imagery in the Canadian ice program p0238 A81-49754
Experimental use of real time SAR imagery in support of oil exploration in the Beaufort Sea p0227 A81-49767
Ocean services for the nation. National ocean goals and objectives for the 1980's [PB81-200602] p0240 N81-31808

SURFACE PROPERTIES
A review of volume scatter theories for modeling applications p0265 N81-33347

SURFACE ROUGHNESS
The use of radar imagery for surface water investigations p0247 A81-43211
Airborne microwave radiometer remote sensing of lake ice p0253 A81-48554
Scatterometer calibration and data correction p0265 N81-33351
Experiment plan: Row and roughness effects on dependence of active microwave measurements of soil moisture [E81-10209] p0211 N81-33575

SURFACE ROUGHNESS EFFECTS
Evaluation of the effect of sea-ice roughness on the microwave emission of the ice p0231 A81-41480
Introduction to the workshop --- on coherent and incoherent radar scattering from rough surfaces and vegetated areas p0276 N81-33340
Wave orbital velocity, fade and SAR response to azimuth waves p0265 N81-33345
Scatterometer calibration and data correction p0265 N81-33351

SURFACE TEMPERATURE
What has been learned from the scanning multi-channel microwave radiometers /SMMRs/ p0269 A81-41995
Satellite determination of the mesoscale variability of the sea surface temperature p0234 A81-44861
Application of the truncated normal distribution technique to the derivation of sea surface temperatures p0234 A81-45881
Application of GOES visible-infrared data to quantifying mesoscale ocean surface temperatures p0236 A81-47021
Infrared imagery for studying the Kara-Bogaz-Gol Bay p0236 A81-48681
Thermal inertia mapping of some areas of Quebec based on aerial and HCMM satellite data p0204 A81-49799
Airborne remote sensing of sea surface chlorophyll and temperature along the outer British Columbia coast p0239 A81-49805
Satellite identification of surface radiant temperature fields of subpixel resolution [PB81-184038] p0265 N81-31615
Topographic slope correction for analysis of thermal infrared images [PB81-211781] p0224 N81-33589

SURFACE WATER
The use of radar imagery for surface water investigations p0247 A81-43211

SURFACE WAVES
Gulf of Mexico satellite radar altimetry [NASA-TM-73285] p0224 N81-33760

SWEDEN
Lineament mapping in northern Sweden from Landsat images using orthogonal image transforms p0226 A81-46039

SYNOPTIC METEOROLOGY
Modeling the terrestrial hydrology for the global atmosphere - The future role of satellite data p0245 A81-43197

SYNTHETIC APERTURE RADAR
Future plans for NASA's Oceanic Processes Program p0231 A81-41997
Imaging ocean waves by synthetic aperture radars with long integration times p0231 A81-42026
Iceberg detectability problems using SAR and SLAR systems p0232 A81-43206
A preliminary analysis of SAR mapping of the Manitoba flood, May 1979 p0248 A81-43220
Multisensor analysis of hydrologic features with emphasis on the Seasat SAR p0251 A81-43544
Look direction dependence of radar backscattering cross section for agricultural fields p0199 A81-43741
Use of Seasat satellite radar imagery for the detection of standing water beneath forest vegetation p0199 A81-43743
Texture measurements from Seasat - SAR images for urban land use interpretation p0214 A81-43749
Radar image preprocessing --- of SEASAT-A SAR data p0272 A81-46038
Spaceborne synthetic aperture radar for oceanography --- Book p0234 A81-46104
The structure of short gravity waves on the ocean surface p0234 A81-46105
SAR ocean imaging mechanisms p0234 A81-46107
The wind speed dependency of ocean microwave backscatter p0234 A81-46109
The study of mesoscale ocean winds p0235 A81-46110
Spatial evolution of ocean wave spectra p0235 A81-46112
Refraction of coastal ocean waves p0235 A81-46113
Detection of the Gulf Stream p0235 A81-46115
A search for cold water rings p0235 A81-46116
Tracking of a warm water ring p0235 A81-46117
The European SAR-Project Convair 580 p0273 A81-48679
Use of elevation models for landform analysis by Seasat SAR imagery [IAF PAPER 81-98] p0260 A81-47349
Advanced synthetic aperture radar for remote sensing p0274 A81-48553
The airborne SAR project - Conclusions and applications p0275 A81-49765
Airborne impulse radar sounding of sea ice p0238 A81-49771
SAR processing of partially coherent and sinusoidally dynamic ocean waves p0239 A81-49776
Digital image analysis of SAR imagery for the detection of icebergs p0238 A81-49777
Application of synthetic aperture radar data to snow cover monitoring p0253 A81-49778
Optimizing imaging radar parameters for ice reconnaissance p0239 A81-49779
Cartographic accuracy of synthetic aperture radar imagery p0262 A81-49780
Seasat satellite investigation of the structure of western Nebraska and its application to the evaluation of geothermal resources [LA-UR-81-1454] p0223 N81-30505
Wave orbital velocity, fade and SAR response to azimuth waves p0265 N81-33345
Scattering theory with application to synthetic aperture radar p0265 N81-33348

T

TECHNOLOGICAL FORECASTING
Large scale human benefits of space industrialization p0277 A81-42513

TECHNOLOGY TRANSFER
Field Study for Remote Sensing: An instructor's manual [NASA-CP-2155] p0279 N81-32564
The workshop --- use and application of remotely sensed data p0280 N81-32566
Why surface-truth field study is needed in remote-sensing instruction p0280 N81-32567
LANDSAT C workshop field/laboratory exercises p0280 N81-32571

TECHNOLOGY UTILIZATION
Seasat data applications by commercial users p0231 A81-41974
Efficiency criteria of space systems for studying the earth's natural resources p0277 A81-42287
Ground water and satellites - An overview/introduction p0248 A81-43226
Crop reporting from space - Problems, promises, potential [AAS 80-062] p0200 A81-44637
European industrial space projects [AAS PAPER 81-053] p0278 A81-46234
Remote sensing in development --- for developing nations p0279 A81-48936
Space Benefits: The secondary application of aerospace technology in other sectors of the economy [NASA-CR-164733] p0279 N81-32086
An industrial perspective of the LANDSAT opportunity p0279 N81-32565

TECTONICS
Concerning the hydrogeological significance of faults on platform regions, as revealed by space imagery p0225 A81-42277
Space research on seismic regions p0225 A81-42280
Complex processing of satellite images and the geological interpretation p0227 A81-48690
NASA selects scientific investigations for Earth dynamics studies [NASA-NEWS-RELEASE-81-129] p0228 N81-29143

TELEMETRY
Remote sensing in hydrology - A challenge to scientists p0243 A81-43177
Adapting GOES DCS for use by Corps of Engineers --- for flood control p0244 A81-43186
Satellite telemetry of hydrologic data in California p0244 A81-43187
Monitoring Canada's water resources in remote regions by satellite telemetry p0244 A81-43188
U.S. geological survey application of satellite telemetry for the support of hydrologic data collection p0258 A81-43189
Advanced technology for satellite data collection systems p0270 A81-43190
Possible applications of communication satellites for research tasks in polar regions [BMFT-FB-W-80-029] p0267 N81-33587

TEMPERATE REGIONS
Satellite-tracked drift buoy observations of the near-surface flow in the eastern mid-latitude North Pacific p0236 A81-47022

TEMPERATURE DISTRIBUTION
Satellite identification of surface radiant temperature fields of subpixel resolution [PB81-184038] p0265 N81-31615

TEMPORAL RESOLUTION
Classification of wheat: Badhwar profile similarity technique [E81-10207] p0207 N81-31598

TERRAIN
Conceptual design of an automated mapping satellite System (MAPSAT)
[PB81-185555] p0264 N81-29522
An evaluation of detail in dynamic visual displays
[AD-A103378] p0222 N81-33578

TERRAIN ANALYSIS
The use of spaceborne photography for topographic mapping p0221 A81-42556
Landsat classification of coastal wetlands in Texas p0248 A81-43234
Land subsidence measured by satellite radar altimetry p0270 A81-43260
Use of imaging radar for geology and archeology p0226 A81-43730
From landforms to avian habitat - A look at topology p0214 A81-43739
Use of remote sensing in landscape stratification for environmental impact assessment p0214 A81-43748
Application of digital terrain data to quantify and reduce the topographic effect on Landsat data p0259 A81-45433
Change vector analysis - An approach for detecting forest changes with Landsat p0202 A81-46056
Correlation function studies for snow and ice p0260 A81-46378
Manual versus digital Landsat analysis for delineating river flooding p0252 A81-45405
Microdensitometry to identify saline rangelands on 70-mm color-infrared aerial film p0202 A81-46406
Analysis of landfills with historic airphotos p0216 A81-46407
First Shuttle payload loading to begin p0273 A81-46461
Stereoorthophotos as aids in the mapping of high mountain regions p0221 A81-46678
Use of elevation models for landform analysis by Seasat-SAR imagery
[IAF PAPER 81-98] p0260 A81-47349
Radar-optical-topographic transformations for scene content analysis p0261 A81-48552
Geological and terrain analysis of the Annapolis County region of Nova Scotia - An application of digital Landsat, radar and colour infrared data p0227 A81-49802
Resource inventory and terrain analysis in north western Manitoba from integrated remote sensing data p0218 A81-49803
Generation and use of digital elevation data for large areas p0221 A81-49811
The sensor image simulator
[AD-A101172] p0275 N81-29512
Interactive digital image processing for terrain data extraction
[AD-A101321] p0264 N81-30499
Knowledge-based image analysis
[AD-A101319] p0264 N81-30852
Terrain profiling from Seasat altimetry
[NASA-CR-156878] p0222 N81-31604
OVSUP: A program for computer-aided disentanglement of overlapping zones p0222 N81-33525

TERRESTRIAL RADIATION
Annual and interannual variations in outgoing longwave radiation over the tropics p0251 A81-43356
Methods of editing cloud and atmospheric layer affected pixels from satellite data --- in south Texas test area
[E81-10169] p0266 N81-33556

TEXAS
Simulation modeling of estuarine ecosystems p0243 A81-42229
A satellite derived technique for estimating rainfall from thunderstorms and hurricanes p0244 A81-43191
Hydrologic land use classification using Landsat p0247 A81-43213
Landsat classification of coastal wetlands in Texas p0248 A81-43234
Land subsidence measured by satellite radar altimetry p0270 A81-43260
Microdensitometry to identify saline rangelands on 70-mm color-infrared aerial film p0202 A81-46406
The environmental vegetation index: A tool potentially useful for arid land management --- Texas and Mexico, plant growth stress due to water deficits
[E81-10191] p0206 N81-29505
Methods development and applications evaluations of NURE aerial reconnaissance survey data for uranium resource evaluation: Beeville/Bay City and Crystal City quadrangles, Texas
[GJBX-69(81)] p0228 N81-30502
Landform-vegetation relationships in the northern Chihuahuan Desert
[AD-A102896] p0208 N81-32588
Measurement of soil moisture trends with airborne scatterometers --- Texas
[E81-10088] p0209 N81-33545
Methods of editing cloud and atmospheric layer affected pixels from satellite data --- in south Texas test area
[E81-10169] p0266 N81-33556

TEXTURES
Multispectral texture analysis p0257 A81-41055
Use of imaging radar for geology and archeology p0226 A81-43730
Texture measurements from Seasat - SAR images for urban land use interpretation p0214 A81-43749
Texture analysis and urban land use classification p0214 A81-44684
Application of multispectral reflectance studies of soils - Pre-Landsat p0200 A81-46031

THEMATIC MAPPING
The use of the spectral and physical-geographic characteristics of natural objects for the interpretation of multispectral satellite images p0257 A81-41484
Evaluation of the possibility of using spectral-band and multispectral aerial photographs for the large-scale survey of natural pastures p0197 A81-41487
NASA water resources/hydrology remote sensing program in the 1980's p0244 A81-43179
A comparison of remote sensing techniques for Minnesota wetlands classification p0249 A81-43239
Remote methods and desert conservation --- Russian book p0213 A81-43523
Wetland mapping from digitized aerial photography p0252 A81-43549
Rainbow 80; Fall Technical Meeting, Niagara Falls, NY, October 7-10, 1980, ASP Technical Papers p0198 A81-43727
Waveband evaluation of proposed thematic mapper in forest cover classification p0199 A81-43738
Texture analysis and urban land use classification p0214 A81-44684
A comparison of automatic classification algorithms for land use map by remotely sensed data p0215 A81-44701
European industrial space projects
[AAS PAPER 81-053] p0278 A81-46234
What does space remote sensing provide p0278 A81-47826
Research on assessment of the recreational value of forests using Landsat digital data p0203 A81-49785
Spectral measurement of rangeland p0218 A81-49790
Computer analysis of Tiros-N/NOAA-6 satellite data for operational snow cover mapping p0262 A81-49795
Benefits of using airborne remote sensing for Thematic Mapping p0275 A81-49801
A simulation of Thematic Mapper performance in an agricultural application p0204 A81-49810
Evaluation of Thematic Mapper bands - A first step in feature selection p0205 A81-49815
Photographic technology development project: Timber typing in the Tahoe Basin using high altitude panoramic photography
[NASA-CR-161082] p0208 N81-32578
A study of the effects of the atmosphere on thematic mapper observations
[E81-10056] p0276 N81-33540
Comparison of laboratory reflectance spectra and LANDSAT multispectral images of Hawaiian lava flows
[E81-10061] p0266 N81-33541
Measurement of soil moisture trends with airborne scatterometers --- Texas
[E81-10088] p0209 N81-33545
A comparative study of the thematic mapper and LANDSAT spectral bands from field measurement data
[E81-10165] p0209 N81-33549

THERMAL MAPPING
Potentials of mapping buried glacier ice with Landsat thermal imagery p0276 A81-43204
Survey of in-situ and remote sensing methods for soil moisture determination p0197 A81-43221
Soil moisture applications of the heat capacity mapping mission p0197 A81-43224
Ground water applications of the heat capacity mapping mission p0248 A81-43233
Combined satellite imagery for study of coastal circulation, Onslow Bay, North Carolina p0233 A81-43250
Thermal patterns of Lake Michigan and Lake Superior from satellite remote sensors and its uses p0250 A81-43256
Preliminary survey of HCMM satellite thermal imagery as applied to hydrospherics p0252 A81-43746
Aerial thermal survey in the study of earth resources --- Russian book p0277 A81-43881
The possibility of using an aerial thermal survey for studying the structure of the salt bed in the Gulf of Kara-Bogaz-Gol p0228 A81-44061
Infrared-temperature variability in a large agricultural field p0200 A81-45432
Identification of subresolution high temperature sources using a thermal IR sensor p0273 A81-46401
Remote sensing of thermal radiation from an aircraft - An analysis and evaluation of crop-freeze protection methods p0202 A81-46895
Infrared imagery for studying the Kara-Bogaz-Gol Bay p0236 A81-48881
Satellite observations of England and north-western Europe p0217 A81-49174
Thermal vegetation canopy model studies p0202 A81-49347
The application of thermography for locating potential frost pockets in forest cutovers p0204 A81-49789
Thermal inertia mapping of some areas of Quebec based on aerial and HCMM satellite data p0204 A81-49799
The detection of groundwater discharges /springs/ using aerial thermography p0254 A81-49800
Meteosat experience in assisting commercial fishing p0239 A81-49807
Soil moisture inferences from thermal infrared measurements of vegetation temperatures
[E81-10184] p0206 N81-29500
Following oceanographic phenomena on the South Coast of Brazil with remote sensing from orbital distance
[INPE-1975-RPE/280] p0240 N81-30488
Dryland pasture and crop conditions as seen by HCMM
[E81-10080] p0209 N81-33542
Methods of editing cloud and atmospheric layer affected pixels from satellite data --- in south Texas test area
[E81-10169] p0266 N81-33556
Topographic slope correction for analysis of thermal infrared images
[PB81-211781] p0224 N81-33589

THUNDERSTORMS
A satellite derived technique for estimating rainfall from thunderstorms and hurricanes p0244 A81-43191
ISS-b experimental results on global distributions of ionospheric parameters and thunderstorm activity p0215 A81-44882

TIDES
Method for estimation of ocean current velocity from satellite images p0231 A81-41350
Microwave radiometer measurement of tidally induced salinity changes off the Georgia coast p0232 A81-42067
Some methods of multitemporal analysis of LANDSAT images resulting from a study on Venice Lagoon
[E81-10205] p0267 N81-33574

TIMBER IDENTIFICATION
Rainforest species on large-scale color photos p0198 A81-43536
Thermal vegetation canopy model studies p0202 A81-49347
Forestry priorities and their implications for the Canadian Remote Sensing Program p0202 A81-49755
SAR image response over a conifer regeneration site p0203 A81-49770
Nationwide forestry applications program. Analysis of forest classification accuracy
[E81-10183] p0206 N81-29499
Photographic technology development project: Timber typing in the Tahoe Basin using high altitude panoramic photography
[NASA-CR-161082] p0208 N81-32578

TIMBER INVENTORY
A photo interpretation approach to forest regrowth monitoring using side-looking airborne radar - Grant County, Oregon p0200 A81-45428
Application of temporal Landsat forest digital data for updating the Yukon RRAMS data base using Aries --- Renewable Resources And Management Statistics p0203 A81-49760
Technical aspects of forest inventory demonstrations using Landsat data - Projects in the Pacific Northwest States p0203 A81-49764
Principal components enhancements versus classifications of Landsat images for forestry applications p0203 A81-49782
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions
[E81-10081] p0209 N81-33543
Evaluation of LANDSAT data analysis for forest survey --- northeastern aspen-birch survey unit in Minnesota - Carlton County
[E81-10175] p0210 N81-33561

TIMBER VIGOR
Extravisual damage detection - Defining the standard normal tree p0198 A81-43537

TIROS N SERIES SATELLITES
Characteristics of TIROS, GOES, DMSP and LANDSAT systems
[E81-10192] p0263 N81-29506

TOPOGRAPHY
The use of spaceborne photography for topographic mapping p0221 A81-42556
Topographic and cartographic applications of photogrammetry p0221 A81-42847
An examination of spectral band ratioing to reduce the topographic effect on remotely sensed data p0221 A81-45427
Space based topographic mapping experiment using Seasat synthetic aperture radar and LANDSAT 3 return beam vidicon imagery
[NASA-CR-164675] p0223 N81-30496
Terrain profiling from Seasat altimetry
[NASA-CR-156878] p0222 N81-31604
Ice sheet altimetry
[NASA-CR-156877] p0240 N81-31605
Reports on cartography and geodesy, series 1: Original reports, Number 81
[ISSN-0469-4236] p0222 N81-33527
Topographic slope correction for analysis of thermal infrared images
[PB81-211781] p0224 N81-33589

TOPOLOGY
From landforms to avian habitat - A look at topology p0214 A81-43739

TRACE CONTAMINANTS
The distribution of the trace gases H2O, NO2, and HNO3 in the middle atmosphere on the basis of LIMS measurements --- Limb Infrared Monitor of Stratosphere p0217 A81-49407

TRANSFORMATIONS (MATHEMATICS)
Radar-optical-topographic transformations for scene content analysis p0261 A81-48552

TRANSMISSIVITY
A comparison of observed and analytically derived remote sensing penetration depths for turbid water [NASA-TM-83176] p0255 N81-33577
TRANSPIRATION
Descriptive and sensitivity analyses of WATBALI: A dynamic soil water model [E81-10193] p0206 N81-29507
TREES (PLANTS)
Mountain pine beetle damage surveys with high-altitude panoramic photography p0199 A81-43732
TRIANGULATION
Measurement of lengths, angles, and areas on the earth's spheroid p0221 A81-42846
Application of new precision measuring systems for photogrammetric comparators [BMFT-FB-T-80-134] p0276 N81-32595
TROPICAL METEOROLOGY
Hurricane 'Flossie' /September 1978/ observed in the north Atlantic, by the Meteosat satellite p0213 A81-41061
Rain estimation over several areas of the globe using satellite imagery p0245 A81-43193
Annual and interannual variations in outgoing longwave radiation over the tropics p0251 A81-43356
TROPICAL REGIONS
The methodology of CIAT's land resource study of tropical America p0216 A81-46046
Remote sensing of soil radionuclide fluxes in a tropical ecosystem --- Eniwetok and Bikini Atolls [UCRL-84501] p0219 N81-29517
Drifting buoy data from the tropical Pacific Ocean during NORPAX equatorial test shuttle experiment [PB81-198939] p0240 N81-31807
TROPICAL STORMS
The occurrence of vertical tilt in tropical cyclones p0238 A81-49656
Eastern North Pacific tropical cyclones of 1980 p0238 A81-49657
TROPOSPHERE
Satellite measurements of tropospheric aerosols [NASA-CR-3459] p0219 N81-31680
TROPOSPHERIC RADIATION
Determination of moisture from NOAA polar orbiting satellite sounding radiances p0243 A81-41158
TUNISIA
A comparison between two photographic methods for the determination of relative bidirectional reflectance p0259 A81-45431
TURBIDITY
A comparison of observed and analytically derived remote sensing penetration depths for turbid water [NASA-TM-83176] p0255 N81-33577

U

U.S.S.R.
Results of ground surveys, carried out in conjunction with satellite and aerial studies, of the state of winter wheat on the Kursk test polygon p0197 A81-41485
Determination of the types and state of crops from multispectral aerial photographs p0197 A81-41486
Evaluation of the possibility of using spectral-band and multispectral aerial photographs for the large-scale survey of natural pastures p0197 A81-41487
Concerning the hydrogeological significance of faults on platform regions, as revealed by space imagery p0225 A81-42277
Ring structures of Precambrian shields, based on the interpretation of space imagery p0225 A81-42278
Space research on seismic regions p0225 A81-42280
The space engineering use efficiency for forest study [IAF PAPER 81-108] p0202 A81-47354
Infrared imagery for studying the Kara-Bogaz-Gol Bay p0236 A81-48681
Dynamic ecosystem of the Aral Basin studied from satellite imagery p0217 A81-48682
The informational estimation of the effectiveness of using satellite imagery in hydrogeological research p0227 A81-48683
The interrelation of linear and isometric objects on satellite imagery and the oil and gas structures of the Buzuluk Basin p0227 A81-48685
Use of satellite pictures for agriculture p0205 N81-28120
Large area application of a corn hazard model --- Soviet Union [E81-10164] p0205 N81-28497
U.S.S.R. SPACE PROGRAM
Soviet remote sensing of the earth's resources and interpretation of space data with reference to the Caspian Sea, Siberia and the Arctic Ocean [IAF PAPER 81-112] p0278 A81-47355
Evaluation of the 1980 Cosmos program p0278 A81-47829
ULTRAVIOLET RADIATION
Role of multiple scattering in ozone profile retrieval from satellite measurements in the ultraviolet p0215 A81-45870
UPWELLING WATER
Following oceanographic phenomena on the South Coast of Brazil with remote sensing from orbital distance [INPE-1975-RPE/280] p0240 N81-30488
URANIUM
Methods development and applications evaluations of NURE aerial reconnaissance survey data for uranium resource evaluation. Beeville/Bay City and Crystal City quadrangles, Texas [GJBX-69(81)] p0228 N81-30502
Airborne gamma-ray spectrometer and magnetometer survey [DE81-027157] p0229 N81-32592
Airborne gamma-ray spectrometer and magnetometer survey. Canyon City quadrangle (Oregon), volume 2 [DE81-028682] p0229 N81-33584
Airborne gamma-ray spectrometer and magnetometer survey. Salem quadrangle (Oregon). volume 2 [DE81-028681] p0229 N81-33585
URBAN RESEARCH
Urban area update procedures using Landsat data p0214 A81-43733
Training site statistics from Landsat and Seasat satellite imagery registered to a common map base p0258 A81-43734
Texture measurements from Seasat - SAR images for urban land use interpretation p0214 A81-43749
Aerosol formation, transformation, and effects in Denver's emissions plume p0214 A81-44526
Texture analysis and urban land use classification p0214 A81-44684
Research on assessment of the recreational value of forests using Landsat digital data p0203 A81-49785
Remote sensing and land use planning p0218 A81-49792
USER MANUALS (COMPUTER PROGRAMS)
Conversion of SPU-Universal disk file to JSC-Universal tape storage. CONVRT user's guide [E81-10185] p0263 N81-29501
Users manual for the US baseline corn and soybean segment classification procedure [E81-10190] p0206 N81-29504
Computer program documentation user information for the RSO-tape print program (RSOPRNT) [E81-10198] p0264 N81-29509
As-built design specification of the automatic registration system for the cartographic technology laboratory [E81-10176] p0267 N81-33562
USER REQUIREMENTS
Seasat data applications by commercial users p0231 A81-41974
Oceanic Satellite Data Distribution System p0231 A81-41996
Efficiency criteria of space systems for studying the earth's natural resources p0277 A81-42287
Requirements on the data/information system --- of satellite systems for earth resources observation p0278 A81-48527
Commercial applications of satellite oceanography p0237 A81-49133
An industrial perspective of the LANDSAT opportunity p0279 N81-32565

V

VECTOR ANALYSIS
Change vector analysis - An approach for detecting forest changes with Landsat p0202 A81-46056
VEGETABLES
Vegetable crop management with remote sensing p0198 A81-43540
VEGETATION
Remote sensing and mapping of pastures p0213 A81-42281
Accuracy evaluation of Landsat digital classification of vegetation in the Great Dismal Swamp p0248 A81-43235
Landsat hydrobiological classification for an inland fresh water marsh within Everglades National Park p0249 A81-43238
Comparison of sampling procedures and data analysis for a land-use and land-cover map p0213 A81-43533
Mapping wetlands using orthophotoquads and 35-mm aerial photographs p0251 A81-43543
Use of Landsat digital data to assist in mapping soils on Arizona rangelands p0201 A81-46047
Interpreter evaluations of airborne radar imagery for ecological and land/use cover classification in southern Manitoba p0218 A81-49773
Applications of remote sensing to construction impact assessment at the Roberts Bank Port, British Columbia p0218 A81-49781
Principal components enhancements versus classifications of Landsat images for forestry applications p0203 A81-49782
Colour - The critical photointerpretation element in the identification of rangeland plant communities on colour and colour-infrared aerial photography p0203 A81-49786
Spectral measurement of rangeland p0218 A81-49790
Digital enhancements for vegetation mapping in a subarctic environment p0282 A81-49793
Use of Landsat images in the monitoring and study of the LG 2 reservoir during the filling period p0254 A81-49797
Resource inventory and terrain analysis in north western Manitoba from integrated remote sensing data p0218 A81-49803
Interactive digital image processing for terrain data extraction [AD-A101321] p0264 N81-30499
Agricultural water demand prediction using remote sensing technology for Georgia resource management [PB81-184137] p0207 N81-30506
Landform-vegetation relationships in the northern Chihuahuan Desert [AD-A102886] p0208 N81-32588
Introduction to the workshop --- on coherent and incoherent radar scattering from rough surfaces and vegetated areas p0276 N81-33340
A review of volume scatter theories for modeling applications p0265 N81-33347
Comparison of laboratory reflectance spectra and LANDSAT multispectral images of Hawaiian lava flows [E81-10061] p0266 N81-33541
A comparative study of the thematic mapper and LANDSAT spectral bands from field measurement data [E81-10165] p0209 N81-33549
VEGETATION GROWTH
A technique for improved assessment of flow resistance characteristics of natural wetlands using Landsat data p0249 A81-43241
Computer-implemented remote sensing techniques for measuring coastal productivity and nutrient transport systems p0250 A81-43243
Remote methods and desert conservation --- Russian book p0213 A81-43523
Remote sensing aided procedure for conifer growth modeling in the northeastern Sierra Nevada p0199 A81-43740
The environmental vegetation index: A tool potentially useful for arid land management --- Texas and Mexico, plant growth stress due to water deficits [E81-10191] p0206 N81-29506
Meteorological satellite data: A tool to describe the health of the world's agriculture [E81-10204] p0207 N81-31596
VERMONT
The development of a remote sensing applications program for Vermont [E81-10149] p0266 N81-33547
VIDEO DATA
Application of delta modulation in on board and ground video data processing systems for the purposes of remote sensing [IAF PAPER 81-102] p0260 A81-47351
VINEYARDS
Interpretation techniques applied to mixed terrains p0218 A81-49788
Cornell University Remote Sensing Program [E81-10174] p0255 N81-33560
VIRGINIA
Accuracy evaluation of Landsat digital classification of vegetation in the Great Dismal Swamp p0248 A81-43235
Spatial correlation effects upon accuracy of supervised classification of land cover p0213 A81-43534
Remote sensing of dinoflagellate blooms in a turbid estuary p0251 A81-43538
Mineralogical, optical, and geochemical properties of John H. Kerr Reservoir sediment samples for AgRISTARS pollution research [E81-10155] p0229 N81-33548
Evaluation of remote sensing data for input into Hydrological Simulation Program-FORTRAN (HSPF) --- modeling the Occoquan watershed in Virginia using LANDSAT imagery for parameter estimation [PB81-209561] p0255 N81-33593
VISIBILITY
NASA participation in the 1980 Persistent Elevated Pollution Episode/Northeast Regional Oxidant Study (PEPE/NROS) Project: Operational aspects [NASA-TM-83170] p0220 N81-32708
VISUAL AIDS
An evaluation of detail in dynamic visual displays [AD-A103378] p0222 N81-33578
VOLCANOES
Stratospheric sulfate from the Gareloi eruption, 1980 - Contribution to the 'ambient' aerosol by a poorly documented volcanic eruption p0213 A81-41404
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions [E81-10081] p0209 N81-33543

W

WASHINGTON
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data. 1: LANDSAT. 2: Remote sensing of volcanic emissions [E81-10081] p0209 N81-33543
WASTE DISPOSAL
Application of remote sensing to monitoring and studying dispersion in ocean dumping p0232 A81-42228
Analysis of landfills with historic airphotos p0216 A81-46407

WATER
A comparison of observed and analytically derived remote sensing penetration depths for turbid water
[NASA-TM-83176] p0255 N81-33577
WATER CIRCULATION
Combined satellite imagery for study of coastal circulation, Onslow Bay, North Carolina
p0233 A81-43250
Preliminary survey of HCMM satellite thermal imagery as applied to hydrospherics p0252 A81-43746
Southern Chesapeake Bay circulation and suspended sediment transport analyzed using Landsat imagery
p0252 A81-43747
WATER COLOR
Nimbus-7 Coastal-Zone Colour Scanner data processing for Earthnet Experience to date p0235 A81-46919
Coastal Oceans Monitoring Satellite System (COMSS) system evaluation study
[ESS/SS-1038] p0239 N81-30168
WATER CURRENTS
A note on indirect detection of seiches in Great Salt Lake, Utah, by NOAA and Landsat satellite imagery
p0247 A81-43218
WATER DEPTH
Derivation of shallow ocean bottom reflectance values from color aerial photography
[AD-A101106] p0241 N81-33763
WATER FLOW
A technique for improved assessment of flow resistance characteristics of natural wetlands using Landsat data
p0249 A81-43241
Descriptive and sensitivity analyses of WATBALI: A dynamic soil water model
[E81-10193] p0206 N81-29507
WATER MANAGEMENT
Landsat data for regulatory permit monitoring
p0247 A81-43214
WATER POLLUTION
Application of remote sensing to monitoring and studying dispersion in ocean dumping p0232 A81-42228
Simulation modeling of estuarine ecosystems
p0243 A81-42229
Remote sensing of coastal pollutants using multispectral data p0233 A81-43245
Satellite detection of oil on the marine surface
p0233 A81-43251
An application of Landsat and computer technology to potential water pollution from soil erosion
p0250 A81-43253
Features of the radar detection of sea surface nonuniformities p0234 A81-43967
Airborne simultaneous spectroscopic detection of laser-induced water Raman backscatter and fluorescence from chlorophyll a and other naturally occurring pigments
p0253 A81-47647
Mineralogical, optical, and geochemical properties of John H. Kerr Reservoir sediment samples for AgRISTARS pollution research
[E81-10155] p0229 N81-33548
Quantification of non-point source sedimentation through densitometric analysis of color infrared aerial photography
[PB81-209157] p0255 N81-33599
WATER QUALITY
Aerospace remote sensing of the coastal zone for water quality and biotic productivity applications
p0233 A81-43246
Using enhanced Landsat images for calibrating real time estuarine water quality models p0250 A81-43252
Bay of Fundy verification of a system for multidate Landsat measurement of suspended sediment
p0250 A81-43254
Assessment and classifications of selected Illinois lakes through the application of space technology
p0250 A81-43255
Lake Ontario dynamics and water quality observations using thematically enhanced Landsat data
p0251 A81-43257
Application of digital image processing techniques and information systems to water quality monitoring of Lake Tahoe p0251 A81-43258
Trophic state determination for shallow coastal lakes from Landsat imagery p0251 A81-43259
Use of ocean color scanner data in water quality mapping p0251 A81-43545
Water quality mapping from Landsat digital data
p0252 A81-45429
Use of water Raman emission to correct airborne laser fluorosensor data for effects of water optical attenuation
p0253 A81-47676
Landsat - What is operational in water resources
p0253 A81-49757
Airborne estimation of water quality parameters in Lake Ontario p0254 A81-49796
The development of a remote sensing applications program for Vermont
[E81-10149] p0266 N81-33547
A study of Minnesota land and water resources using remote sensing. Volume 14
[E81-10166] p0254 N81-33550
Lakewide monitoring of suspended solids using satellite data --- Lake Superior water reclamation
p0254 N81-33552
Cornell University Remote Sensing Program
[E81-10174] p0255 N81-33560
WATER RECLAMATION
Lakewide monitoring of suspended solids using satellite data --- Lake Superior water reclamation
p0254 N81-33552
WATER RESOURCES
Satellite hydrology; Proceedings of the Fifth Annual William T. Pecora Memorial Symposium on Remote Sensing, Sioux Falls, SD, June 10-15, 1979
p0243 A81-43176
Remote sensing in hydrology - A challenge to scientists p0243 A81-43177
Satellite applications in river and flood forecasting
p0243 A81-43178
NASA water resources/hydrology remote sensing program in the 1980's p0244 A81-43179
Satellite versus conventional methods in hydrology
p0244 A81-43183
An introduction to satellite hydrology
p0244 A81-43184
Satellite telemetry of hydrologic data in California
p0244 A81-43187
Monitoring Canada's water resources in remote regions by satellite telemetry p0244 A81-43188
Roles of satellites in hydrology p0245 A81-43199
The use of radar imagery for surface water investigations p0247 A81-43211
Improving stream flow estimates through the use of Landsat p0247 A81-43216
Ground water and satellites - An overview/introduction
p0248 A81-43226
Improvements in lake volume predictions using Landsat data p0249 A81-43237
Using Landsat imagery to study the Okavango Swamp, Botswana p0249 A81-43242
Application of remote sensing for California irrigated lands assessment p0213 A81-43261
WATER RUNOFF
Satellite snow mapping techniques with emphasis on the use of Landsat p0245 A81-43200
Application of snow covered area to runoff forecasting, in the Sierra Nevada, California p0245 A81-43201
Prediction of water yield using satellite imagery and a snowmelt simulation model p0246 A81-43205
Landsat derived snow cover as an input variable for snow melt runoff forecasting in South Central Colorado
p0246 A81-43208
Operational use of satellite data for snow inventory and runoff forecast p0246 A81-43210
Suburban soil loss and runoff simulation assisted by interpretation of large scale aerial photography
p0253 A81-48941
Landsat observations of snowcover depletion and flooding in the Chesapeake Bay area during the winter of 1979
p0253 A81-48942
WATER TEMPERATURE
Thermal patterns of Lake Michigan and Lake Superior from satellite remote sensors and its uses
p0250 A81-43256
Airborne remote sensing of sea surface chlorophyll and temperature along the outer British Columbia coast
p0239 A81-49805
WATER VAPOR
What has been learned from the scanning multi-channel microwave radiometers /SMMRs/ p0269 A81-41995
WATER WAVES
Imaging ocean waves by synthetic aperture radars with long integration times p0231 A81-42026
A comparison of Seasat 1 altimeter measurements of wave height with measurements made by a pitch-roll buoy p0231 A81-42066
Satellite detection of seiches in Great Salt Lake, Utah
p0243 A81-42126
Wave direction measured by four different systems
p0232 A81-42622
Particular features of the ocean glitter pattern observed from a sun-synchronous orbit p0234 A81-45436
SAR ocean imaging mechanisms p0234 A81-46107
Spatial evolution of ocean wave spectra
p0235 A81-46112
Refraction of coastal ocean waves p0235 A81-46113
SAR processing of partially coherent and sinusoidally dynamic ocean waves p0239 A81-49776
Sea surface scattering p0241 N81-33344
Wave orbital velocity, fade and SAR response to azimuth waves p0265 N81-33345
Gulf of Mexico satellite radar altimetry
[NASA-TM-73295] p0224 N81-33760
WATERFOWL
Mapping the Great Salt Lake shoreline and associated waterfowl habitat from Landsat data p0252 A81-43742
WATERSHEDS
A statistical approach to rainfall estimation using satellite data p0245 A81-43198
Application of snow covered area to runoff forecasting, in the Sierra Nevada, California p0245 A81-43201
Hydrologic land use classification using Landsat
p0247 A81-43213
An application of Landsat and computer technology to potential water pollution from soil erosion
p0250 A81-43253
Aircraft active microwave measurements for estimating soil moisture p0271 A81-43547
Active microwave measurements for estimating soil moisture in Oklahoma p0199 A81-43744
Landsat - What is operational in water resources
p0253 A81-49757
The detection of groundwater discharges /springs/ using aerial thermography p0254 A81-49800
Agricultural water demand prediction using remote sensing technology for Georgia resource management
[PB81-184137] p0207 N81-30506
Photographic technology development project: Timber typing in the Tahoe Basin using high altitude panoramic photography
[NASA-CR-161082] p0208 N81-32578
Dryland pasture and crop conditions as seen by HCMM
[E81-10080] p0209 N81-33542
Evaluation of remote sensing data for input into Hydrological Simulation Program-FORTRAN (HSPF) --- modeling the Occoquan watershed in Virginia using LANDSAT imagery for parameter estimation
[PB81-209561] p0255 N81-33593
Quantification of non-point source sedimentation through densitometric analysis of color infrared aerial photography
[PB81-209157] p0255 N81-33599
WAVE PROPAGATION
Method for estimation of ocean current velocity from satellite images p0231 A81-41350
WAVEFORMS
Radar altimeter waveform modeled parameter recovery --- SEASAT-1 data
[NASA-TM-73294] p0275 N81-30325
WEATHER FORECASTING
Meteorological applications of the ARGOS system
[IAF PAPER 81-121] p0273 A81-47360
Potential for detection of natural disasters via Meteosat
[IAF PAPER 81-263] p0216 A81-47430
Use of satellite pictures for agriculture
p0205 N81-28120
Ocean services for the nation. National ocean goals and objectives for the 1980's
[PB81-200602] p0240 N81-31808
WEATHER MODIFICATION
Basic problems of the physics and chemistry of contemporary changes of climate p0216 A81-47002
WETLANDS
Landsat classification of coastal wetlands in Texas
p0248 A81-43234
Using Landsat MSS data with soils information to identify wetland habitats p0249 A81-43236
Improvements in lake volume predictions using Landsat data p0249 A81-43237
A comparison of remote sensing techniques for Minnesota wetlands classification p0249 A81-43239
Landsat interpretation of prairie lakes and wetlands of eastern South Dakota p0249 A81-43240
A technique for improved assessment of flow resistance characteristics of natural wetlands using Landsat data
p0249 A81-43241
Mapping wetlands using orthophotoquads and 35-mm aerial photographs p0251 A81-43543
Wetland mapping from digitized aerial photography
p0252 A81-43549
Mapping the Great Salt Lake shoreline and associated waterfowl habitat from Landsat data p0252 A81-43742
The use of CIR and airborne multispectral scanner techniques for wetland soils mapping of highway corridors p0215 A81-46044
WHEAT
Results of ground surveys, carried out in conjunction with satellite and aerial studies, of the state of winter wheat on the Kursk test polygon p0197 A81-41485
Determination of the types and state of crops from multispectral aerial photographs p0197 A81-41486
Sampling Landsat classifications for crop area estimation p0202 A81-46404
Assessing winter wheat dry matter production via spectral reflectance measurements p0202 A81-49344
Soil moisture inferences from thermal infrared measurements of vegetation temperatures
[E81-10184] p0206 N81-29500
Evaluation of spring wheat and barley crop calender models for the 1979 crop year
[E81-10197] p0206 N81-29508
AgRISTARS (Agriculture And Resources Inventory Surveys Through Aerospace Remote Sensing) DC/LC (Domestic Crops and Land Rover) project summary crop area estimates for Kansas and Iowa, 1980
[PB81-196909] p0207 N81-30511
A description of the reformatted spring small grains labeling procedure used in test 2, part 2 of the US/Canada wheat and barley exploratory experiment
[E81-10206] p0207 N81-31597
Classification of wheat: Badhwar profile similarity technique
[E81-10207] p0207 N81-31598
Weather analysis and interpretation procedures developed for the US/Canada wheat and barley exploratory experiment
[E81-10208] p0207 N81-31599
Crop area estimates using ground-gathered and LANDSAT data. A multitemporal approach: Missouri, 1979
[PB81-186751] p0208 N81-31614
Analysis of US spring wheat and spring barley periodic ground truth
[E81-10203] p0208 N81-32576
Dryland pasture and crop conditions as seen by HCMM
[E81-10080] p0209 N81-33542

Australian transition year special studies
[E81-10179] p0210 N81-33565
A crop moisture stress index for large areas and its application in the prediction of spring wheat phenology
[E81-10202] p0210 N81-33573

WILDLIFE
A selected bibliography: Remote sensing applications in wildlife management
[PB81-215881] p0211 N81-33598

WIND MEASUREMENT
Performance evaluation of a spaceborne scatterometer
p0269 A81-41920
Satellite scatterometer p0232 A81-42102

WIND RIVER RANGE (WY)
Multisensor analysis of hydrologic features with emphasis on the Seasat SAR p0251 A81-43544

WIND VELOCITY
What has been learned from the scanning multi-channel microwave radiometers /SMMRs/ p0269 A81-41995
The wind speed dependency of ocean microwave backscatter p0234 A81-46109
The study of mesoscale ocean winds
p0235 A81-46110

WIND VELOCITY MEASUREMENT
The future for satellite-derived surface winds
p0237 A81-49129
Cornell University Remote Sensing Program
[E81-10174] p0255 N81-33560

WINTER
The satellite record of the winter of 1978-79 in North America p0246 A81-43203

WISCONSIN
Improving stream flow estimates through the use of Landsat p0247 A81-43216

WORLD METEOROLOGICAL ORGANIZATION
Meteorological applications of the ARGOS system
[IAF PAPER 81-121] p0273 A81-47360

WRANGELL MOUNTAINS (AK)
Potentials of mapping buried glacier ice with Landsat thermal imagery p0246 A81-43204

WYOMING
Multisensor analysis of hydrologic features with emphasis on the Seasat SAR p0251 A81-43544

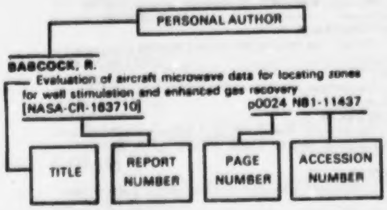
Y

YIELD
Yield Model Development (YMD) implementation plan for fiscal years 1981 and 1982
[E81-10211] p0208 N81-32577

PERSONAL AUTHOR INDEX

Earth Resources/*A Continuing Bibliography (Issue 32)* JANUARY 1982

Typical Personal Author Index Listing



PERSONAL AUTHOR
BABCOCK, R.
Evaluation of aircraft microwave data for locating zones for well stimulation and enhanced gas recovery
[NASA-CR-163710]
p0024 N81-11437
TITLE
REPORT NUMBER
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title, e.g., **p0024 N81-11437**. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

A

AASE, J. K
Assessing winter wheat dry matter production via spectral reflectance measurements p0202 A81-49344

ABBAS, M. M.
A differential inversion method for high resolution atmospheric remote sensing p0215 A81-45862

ADAMS, J. A. S.
Methods development and applications evaluations tof NURE aerial reconnaissance survey data for uranium resource evaluation: Beeville/Bay City and Crystal City quadrangles, Texas
[GJBX-69(81)] p0228 N81-30502

ADAMS, J. B.
Comparison of laboratory reflectance spectra and LANDSAT multispectral images of Hawaiian lava flows
[E81-10061] p0266 N81-33541

ADASKO, V.
New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300'
[IAF PAPER 81-212] p0273 A81-47407

AFOLDI, T. T.
Bay of Fundy verification of a system for multidate Landsat measurement of suspended sediment
p0250 A81-43254

AHERN, F. J.
Rapeseed - Guidelines for operational monitoring
p0203 A81-49784
Spectral measurement of rangeland
p0218 A81-49790
A simulation of Thematic Mapper performance in an agricultural application p0204 A81-49810
Evaluation of Thematic Mapper bands - A first step in feature selection p0205 A81-49815

AKHAVI, M. S.
Optical and digital analyses of Landsat data depicting hydrogeological features of the Daryacheh-Ye-Namak area, Iran p0225 A81-43215

ALANIZ, M. A.
Microdensitometry to identify saline rangelands on 70-mm color-infrared aerial film p0202 A81-46406

ALCARAZ, A.
Tiwi geothermal project - The Philippines
p0225 A81-41908

ALEXANDER, L.
An investigation of the autocorrelation function of radar images p0282 A81-49768

ALFANO, J. J.
Modeling the terrestrial hydrology for the global atmosphere - The future role of satellite data
p0245 A81-43197

ALFOLDI, T. T.
Canadian Symposium on Remote Sensing, 6th, Halifax, Canada, May 21-23, 1980, Proceedings
p0279 A81-49751

ALISHOUSE, J.
What has been learned from the scanning multi-channel microwave radiometers /SMMRs/ p0269 A81-41995

ALLORD, G. J.
Improving stream flow estimates through the use of Landsat p0247 A81-43216

ALPERS, W. R.
Imaging ocean waves by synthetic aperture radars with long integration times p0231 A81-42026

ALVO, M.
A measure of reliability for classification of earth satellite data p0257 A81-42631

AMANO, H.
Research on assessment of the recreational value of forests using Landsat digital data p0203 A81-49785

AMBROZIAK, R. A.
Yield Model Development (YMD) implementation plan for fiscal years 1981 and 1982
[E81-10211] p0208 N81-32577

AMIS, M. L.
Evaluation of large area crop estimation techniques using LANDSAT and ground-derived data
[E81-10200] p0206 N81-29511

AMOS, C. L.
Bay of Fundy verification of a system for multidate Landsat measurement of suspended sediment
p0250 A81-43254

AMURSKII, G. I.
The use of imagery of the earth to study the structure of degassing zones within oil and gas basins
p0225 AP1-42276

ANDERSEN, T.
Operational use of satellite data for snow inventory and runoff forecast p0246 A81-43210

ANDERSON, D. G.
Satellite versus conventional methods in hydrology
p0244 A81-43183
Roles of satellites in hydrology p0246 A81-43199

ANDERSON, I. C.
A top-down approach to the use of simulation in computer system design p0274 A81-48331

ANDERSSON, L. C.
Lineament mapping in northern Sweden from Landsat images using orthogonal image transforms
p0226 A81-48039

ANDREEV, G. G.
Machine method for the equalization of average phototone in an aerial photograph field
p0257 A81-41482
The possibilities of the automated classification of agricultural objects on the basis of their multispectral aerial-spaceborne images p0197 A81-41488
Practical application of the method of empty blocks for the computerized determination of the boundaries of agricultural objects p0197 A81-41489

ANTIKIDIS, J.-P.
Acquisition and preprocessing of images collected by future European Space Agency satellites
p0263 A81-49814

ANTIPOV, I. T.
Determination of the external-orientation elements of single photographs and stereopairs p0257 A81-42555

APOLLONI, A.
Use of elevation models for landform analysis by Seasat-SAR imagery
[IAF PAPER 81-98] p0260 A81-47349

AQUINO, R.
Tiwi geothermal project - The Philippines
p0225 A81-41908

AQUIPO, S.
Tiwi geothermal project - The Philippines
p0225 A81-41908

ARAUJO, E. O.
Visual enhancement of images of natural resources: Applications in geology
[E81-10181] p0228 N81-32575

ARGENTIERO, P. D.
Inventory estimation on the massively parallel processor p0259 A81-46052

ARMSTRONG, T. A.
Characteristics, of TIROS, GOES, DMSP and LANDSAT systems
[E81-10192] p0263 N81-29506

ARMSTRONG, T. E.
Australian transition year special studies
[E81-10179] p0210 N81-33565

ARSENAULT, L. D.
Single and multiple parameter microwave signatures of sea ice p0238 A81-49774
Radar detection of sea-ice ridges and icebergs in frozen oceans at incidence angles from 0 deg to 90 deg
p0238 A81-49775

ARYA, L. M.
Evaluation of gravimetric ground truth soil moisture data collected for the agricultural soil moisture experiment, 1978 Colby, Kansas, aircraft mission
[E81-10114] p0205 N81-29494
Experiment plan: Row and roughness effects on dependence of active microwave measurements of soil moisture
[E81-10209] p0211 N81-33575

ASHBURN, P.
Large area application of a corn hazard model
[E81-10164] p0205 N81-28497

ASTASHKIN, A. A.
Efficiency criteria of space systems for studying the earth's natural resources p0277 A81-42287
The characteristics of combining devices with different survey bands aboard a satellite p0274 A81-48889

AUGUSTINE, J. A.
Insights into errors of SMS inferred GATE convective rainfall p0243 A81-420'o5
Rain estimation over several areas of the globe using satellite imagery p0245 A81-43193

AUSTIN, W. W.
Classification of wheat: Badhwar profile similarity technique
[E81-10207] p0207 N81-31598

AVANESOV, G. A.
Selection of reference zones for the automatic coordinate control of space images p026-m A81-48693

AVDUEVSKII, V. S.
Efficiency criteria of space systems for studying the earth's natural resources p0277 A81-42287

B

BABCOCK, E. M.
Correlation of geologic structure inferred from computer enhanced Landsat imagery with underground water supplies in Arizona p0225 A81-43227

BACHAND, A.
Use of Landsat images in the monitoring and study of the I G 2 reservoir during the filling period
p0254 A81-49797

BADHWAR, G. D.
A comparative study of the thematic mapper and LANDSAT spectral bands from field measurement data
[E81-10165] p0209 N81-33549

BAGGETT, J.
A multistage mapping approach for an irrigated croplands inventory p0198 A81-43262

BAGOT, K. E.
Current resource mapping and environmental monitoring applications using Landsat MSS data in Scotland
p0218 A81-49806

BAKER, J. L.
Satellite aided coastal zone monitoring and vessel traffic system p0231 A81-41755

BAKER, V. R.
An examination of fluvial morphological characteristics of western Amazon streams from Apollo-Soyuz photographs p0247 A81-43212

BALEBANOV, V.
New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300'
[IAF PAPER 81-212] p0273 A81-47407

BALICK, L.
Thermal vegstation canopy model studies
p0202 A81-49347

BANNER, A.
The application of thermography for locating potential frost pockets in forest cutovers p0204 A81-49789

BARNES, J. C.
Satellite snow mapping techniques with emphasis on the use of Landsat p0245 A81-43200
Comparative analysis of sea ice features using Side-Looking Airborne Radar (SLAR) and LANDSAT imagery
[E81-10044] p0241 N81-33539

BASHKOVA, T. A.
Determination of the external-orientation elements of single photographs and stereopairs p0257 A81-42555

The influence of the accuracy of determining the elements of the external orientation of a stereopair on the processing of aerial photographs on the basis of adjusting elements
p0261 A81-48773

BATTEN, L. G.
Synergistic relationships among remote-sensing and geophysical media Geological and hydrological applications
p0255 N81-33553

BAUER, M. E.
An assessment of Landsat data acquisition history on identification and area estimation of corn and soybeans
p0200 A81-46032
Sampling Landsat classifications for crop area estimation
p0202 A81-46404

BAUMANN, W. T.
Inversion of multiwavelength radiometer measurements by three-dimensional filtering
p0271 A81-45873

BAUMGARDNER, M.
A case study of soil erosion detection by digital analysis of the remotely sensed multispectral Landsat scanner data of a semi-arid land in southern India
p0201 A81-46050

BAUMGARDNER, M. F.
Application of multispectral reflectance studies of soils - Pre-Landsat
p0200 A81-46031

BAUSCH, U.
Partially automated object extraction from aerial photographs and land maps
p0266 N81-33528

BEAL, R. C.
Spaceborne synthetic aperture radar for oceanography
p0234 A81-46104
Spatial evolution of ocean wave spectra
p0235 A81-46112

BEAUBIEN, J.
Principal components enhancements versus classifications of Landsat images for forestry applications
p0203 A81-49782

BEGNI, G.
Image quality for SPOT satellite - Specifications and budget
[IAF PAPER 81-104]
p0261 A81-47352

BELIAEV, M. IU.
Main tasks and methods of operational planning of experiments concerning the observations of the earth from space
p0277 A81-42288

BELIAEVA, N. V.
Results of ground surveys, carried out in conjunction with satellite and aerial studies, of the state of winter wheat on the Kursk test polygon
p0197 A81-41485
Evaluation of the possibility of using spectral-band and multispectral aerial photographs for the large-scale survey of natural pastures
p0197 A81-41487

BELIKOVA, T. P.
Geological interpretation in an interactive mode in automated systems of digital image processing
p0225 A81-42289

BELINSKII, A. N.
Experience with image combination in multispectral aerial photography
p0257 A81-41481
Pseudocolor representation of multispectral aerial images by means of a three-channel projector
p0269 A81-41483

BENDURA, R. J.
NASA participation in the 1980 Persistent Elevated Pollution Episode/Northeast Regional Oxidant Study (PEPE/NROS) Project Operational aspects
[NASA-TM-83170]
p0220 N81-32708

BENNY, A. H.
A technique for line extraction from LANDSAT multi-spectral scanner satellite data with some applications of the technique
[RAE-TR-81010]
p0265 N81-31613

BENSON, M. L.
Rainforest species on large-scale color photos
p0198 A81-43536

BENTLEY, C. R.
Investigation of Antarctic crust and upper mantle using Magsat and other geophysical data
[E81-10113]
p0222 N81-32574

BERG, C. P.
Satellite detection of seiches in Great Salt Lake, Utah
p0243 A81-42126
The satellite record of the winter of 1978-79 in North America
p0246 A81-43203
A note on indirect detection of seiches in Great Salt Lake, Utah, by NOAA and Landsat satellite imagery
p0247 A81-43218
Assessing the Red River of the North 1978 flooding from NOAA satellite data
p0248 A81-43219

BERGER, Z.
Suburban soil loss and runoff simulation assisted by interpretation of large scale aerial photography
p0253 A81-48941

BERNARDINI, G. C.
European industrial space projects
[AAS PAPER 81-053]
p0278 A81-46234

BERNIER, M.
Thermal inertia mapping of some areas of Quebec based on aerial and HCMM satellite data
p0204 A81-49799

BERNSTEIN, R.
Requirements on the data/information system
p0278 A81-48527

BERRETTA, G.
Analysis of the November 23, 1980 earthquake as a design basis for satellite emergency communication
[IAF PAPER 81-269]
p0216 A81-47433

BESSIS, J. L.
Data collection and location by satellite - The Argos system
[IAF PAPER 81-80]
p0273 A81-47338
Meteorological applications of the ARGOS system
[IAF PAPER 81-121]
p0273 A81-47360

BEST, R. G.
Landsat interpretation of prairie lakes and wetlands of eastern South Dakota
p0249 A81-43240

BHARTIA, P. K.
Role of multiple scattering in ozone profile retrieval from satellite measurements in the ultraviolet
p0215 A81-45870

BICE, K. L.
Mineralogical, optical, and geochemical properties of John H. Kerr Reservoir sediment samples for AgRISTARS pollution research
[E81-10155]
p0229 N81-33548

BIEHL, L. L.
Development of a digital data base for reflectance-related soil information
p0201 A81-46051

BINENKO, V. I.
Correlation between integral and spectral albedos of clouds over water surfaces
p0235 A81-47004

BIRNIE, R. W.
An investigation of vegetation and other Earth resource/feature parameters using LANDSAT and other remote sensing data 1 LANDSAT 2 Remote sensing of volcanic emissions
[E81-10081]
p0209 N81-33543

BISCHOFF, K.
First results of the Intercosmos satellite IK-21
[IAF PAPER 81-214]
p0274 A81-47409

BLACKWELL, R. J.
Application of digital image processing techniques and information systems to water quality monitoring of Lake Tahoe
p0251 A81-43258

BLANCHARD, B. J.
Dryland pasture and crop conditions as seen by HCMM
[E81-10080]
p0209 N81-33542

BLANTON, J. O.
Microwave radiometer measurement of tidally induced salinity changes off the Georgia coast
p0232 A81-42067

BLAZQUEZ, C. H.
Vegetable crop management with remote sensing
p0198 A81-43540

BLYSTONE, R. K.
On the analysis of remote sensing data to predict selected vegetative variables
p0258 A81-43736

BOCHEV, A.
New complex for ionosphere-magnetosphere study 'Intercosmos-Bulgaria-1300'
[IAF PAPER 81-212]
p0273 A81-47407

BOCK, P.
Modeling the terrestrial hydrology for the global atmosphere - The future role of satellite data
p0245 A81-43197

BOERNER, W. M.
Optimal polarization concept in radar imaging
p0265 N81-33350

BOGDANOV, A. A.
Concerning the possibility of improving the spectroradiometric accuracy of remote sensing of the earth by means of multispectral band scanners
p0270 A81-42285

BOISSONNAULT, J.
Mapping the Great Salt Lake shoreline and associated waterf[illegible] habitat from Landsat data
p0252 A81-43742

BOITR[illegible]T, C. A.
Measurements of CF2Cl2, CFCl3, and N2O in the lower stratosphere between 2 deg S and 73 deg N latitude
p0214 A81-44515

BOKSHTEIN, I. M.
Experience with image combination in multispectral aerial photography
p0257 A81-41481

BOLAND, D. H. P.
Assessment and classifications of selected Illinois lakes through the application of space technology
p0250 A81-43255

BOMMAS, G.
Possible applications of communication satellites for research tasks in polar regions
[BMFT-FB-W-80-029]
p0267 N81-33587

BONDAREVA, M. S.
The use of imagery of the earth to study the structure of degassing zones within oil and gas basins
p0225 A81-42276

BONN, F.
Thermal inertia mapping of some areas of Quebec based on aerial and HCMM satellite data
p0204 A81-49799

BORN, G. H.
Orbit determination requirements for TOPEX
[AAS PAPER 81-158]
p0221 A81-45828

BORSTAD, G. A.
Airborne remote sensing of sea surface chlorophyll and temperature along the outer British Columbia coast
p0239 A81-49805

BOSCHER, J.
Experimental investigation of the physical fundamentals for remote sensing of soil and vegetation moisture by active infrared reflectance spectroscopy using CO2 laser technique
[BMFT-FB-W-80-037]
p0211 N81-33588

BOWLEY, C. J.
Satellite snow mappin, techniques with emphasis on the use of Landsat
p0245 A81-43200
Comparative analysis of sea ice features using Side-Looking Airborne Radar (SLAR) and LANDSAT imagery
[E81-10044]
p0241 N81-33539

BRACALENTE, E. M.
Performance evaluation of a spaceborne scatterometer
p0269 A81-41920
The study of mesoscale ocean winds
p0235 A81-46110

BRADLEY, G. A.
Potential application of satellite radar to monitor soil moisture
p0270 A81-43223

BRETHERTON, F. P.
Climate, the oceans, and remote sensing
p0237 A81-49132

BRETON, D.
The remote sensing satellite program of the European Space Agency
p0279 A81-49762

BRISTOW, M.
Use of water Raman emission to correct airborne laser fluorosensor data for effects of water optical attenuation
p0253 A81-47676

BRITT, C. L., JR.
Performance evaluation of a spaceborne scatterometer
p0269 A81-41920

BROCHU, R.
Thermal inertia mapping of some areas of Quebec based on aerial and HCMM satellite data
p0204 A81-49799

BROOKS, R. L.
Land subsidence measured by satellite radar altimetry
p0270 A81-43260
Terrain profiling from Seasat altimetry
[NASA-CR-156878]
p0222 N81-31604
Ice sheet altimetry
[NASA-CR-156877]
p0240 N81-31605

BROWN, A. J.
Application of snow covered area to runoff forecasting, in the Sierra Nevada, California
p0245 A81-43201

BROWN, R. J.
Rapeseed - Guidelines for operational monitoring
p0203 A81-49784
Spectral measurement of rangeland
p0218 A81-49790
A simulation of Thematic Mapper performance in an agricultural application
p0204 A81-49810
Evaluation of Thematic Mapper bands - A first step in feature selection
p0205 A81-49815

BROWN, R. M.
Airborne remote sensing of sea surface chlorophyll and temperature along the outer British Columbia coast

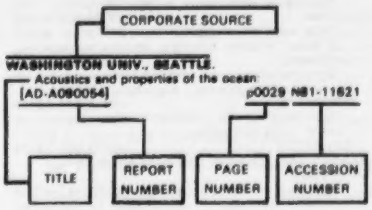
CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing



The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

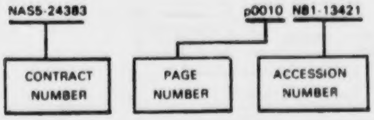
CONTRACT NUMBER INDEX

Earth Resources/*A Continuing Bibliography (Issue 32)* JANUARY 1982

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

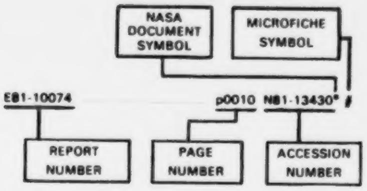
REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

16. Abstract

This bibliography list 580 reports, articles, and other documents introduced into the NASA scientific and technical information system between October 1 and December 31, 1981. Emphasis is placed on the use of remote sensing and geophysical instrumentation in spacecraft and aircraft to survey and inventory natural resources and urban areas. Subject matter is grouped according to agriculture and forestry, environmental changes and cultural resources, geodesy and cartography, geology and mineral resources, hydrology and water management, data processing and distribution systems, instrumentation and sensors, and economic analysis.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley
COLORADO
University of Colorado, Boulder
DISTRICT OF COLUMBIA
Library of Congress
GEORGIA
Georgia Institute of Technology, Atlanta
ILLINOIS
The John Crerar Library, Chicago
MASSACHUSETTS
Massachusetts Institute of Technology, Cambridge
MISSOURI
Linda Hall Library, Kansas City
NEW YORK
Columbia University, New York
OKLAHOMA
University of Oklahoma, Bizzell Library
PENNSYLVANIA
Carnegie Library of Pittsburgh
WASHINGTON
University of Washington, Seattle

NASA publications (those indicated by an '*' following the accession number) are also received by the following public and free libraries:

CALIFORNIA
Los Angeles Public Library
San Diego Public Library
COLORADO
Denver Public Library
CONNECTICUT
Hartford Public Library
MARYLAND
Enoch Pratt Free Library, Baltimore
MASSACHUSETTS
Boston Public Library
MICHIGAN
Detroit Public Library
MINNESOTA
Minneapolis Public Library and Information Center
NEW JERSEY
Trenton Public Library
NEW YORK
Brooklyn Public Library
Buffalo and Erie County Public Library
Rochester Public Library
New York Public Library
OHIO
Akron Public Library
Cincinnati and Hamilton County Public Library
Cleveland Public Library
Dayton Public Library
Toledo and Lucas County Public Library
TEXAS
Dallas Public Library
Fort Worth Public Library
WASHINGTON
Seattle Public Library
WISCONSIN
Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols '#' and '*', from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

Earth Resources
A Continuing Bibliography with Indexes

ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges.

STAR (N-10000 Series)	N82-10001 - N82-16039
IAA (A-10000 Series)	A82-10001 - A82-18839

This bibliography was prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by PRC Government Information Systems.

NASA SP-7041(33)

EARTH RESOURCES

A CONTINUING BIBLIOGRAPHY WITH INDEXES

Issue 33

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced between January 1 and March 31, 1982 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

This supplement is available as NTISUB/038/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $10.50 domestic; $21.50 foreign for standing orders. Please note: Standing orders are subscriptions which do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

INTRODUCTION

The technical literature described in this continuing bibliography may be helpful to researchers in numerous disciplines such as agriculture and forestry, geography and cartography, geology and mining, oceanography and fishing, environmental control, and many others. Until recently it was impossible for anyone to examine more than a minute fraction of the Earth's surface continuously. Now vast areas can be observed synoptically, and changes noted in both the Earth's lands and waters, by sensing instrumention on orbiting spacecraft or on aircraft.

This literature survey lists 436 reports, articles, and other documents announced between January 1 and March 31, 1982 in *Scientific and Technical Aerospace Reports (STAR)*, and *International Aerospace Abstracts (IAA)*.

The coverage includes documents related to the identification and evaluation by means of sensors in spacecraft and aircraft of vegetation, minerals, and other natural resources, and the techniques and potentialities of surveying and keeping up-to-date inventories of such riches. It encompasses studies of such natural phenomena as earthquakes, volcanoes, ocean currents, and magnetic fields; and such cultural phenomena as cities, transportation networks, and irrigation systems. Descriptions of the components and use of remote sensing and geophysical instrumentation, their subsystems, observational procedures, signature and analyses and interpretive techniques for gathering data are also included. All reports generated under NASA's Earth Resources Survey Program for the time period covered in this bibliography will also be included. The bibliography does not contain citations to documents dealing mainly with satellites or satellite equipment used in navigation or communication systems, nor with instrumentation not used aboard aerospace vehicles.

The selected items are grouped in nine categories. These are listed in the Table of Contents with notes regarding the scope of each category. These categories were especially chosen for this publication, and differ from those found in *STAR* and *IAA*.

Each entry consists of a standard bibliographic citation accompanied by an abstract. The citations and abstracts are reproduced exactly as they appeared originally in *STAR*, or *IAA*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the variation in citation appearance.

Under each of the nine categories, the entries are presented in one of two groups that appear in the following order:

IAA entries identified by accession number series A82-10,000 in ascending accession number order;

STAR entries identified by accession number series N82-10,000 in ascending accession number order.

After the abstract section, there are five indexes:

subject, personal author, corporate source, contract number and report/accession number.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

TABLE OF CONTENTS

Page

Category 01 Agriculture and Forestry 1

Includes crop forecasts, crop signature analysis, soil identification, disease detection, harvest estimates, range resources, timber inventory, forest fire detection, and wildlife migration patterns.

Category 02 Environmental Changes and Cultural Resources 7

Includes land use analysis, urban and metropolitan studies, environmental impact, air and water pollution, geographic information systems, and geographic analysis.

Category 03 Geodesy and Cartography 15

Includes mapping and topography.

Category 04 Geology and Mineral Resources 19

Includes mineral deposits, petroleum deposits, spectral properties of rocks, geological exploration, and lithology.

Category 05 Oceanography and Marine Resources 23

Includes sea-surface temperature, ocean bottom surveying imagery, drift rates, sea ice and icebergs, sea state, fish location

Category 06 Hydrology and Water Management 35

Includes snow cover and water runoff in rivers and glaciers, saline intrusion, drainage analysis, geomorphology of river basins, land uses, and estuarine studies.

Category 07 Data Processing and Distribution Systems 41

Includes film processing, computer technology, satellite and aircraft hardware, and imagery.

Category 08 Instrumentation and Sensors 49

Includes data acquisition and camera systems and remote sensors.

Category 09 General 55

Includes economic analysis.

Instructions are given for using the Winterkill indicator model CCAD data base interface driver. The purpose of the system is to interface the Winterkill Indicator Model with the CCAD operational data base. The interface driver routine decides what meteorological stations should be processed and calls the proper subroutines to process the stations. Author

A82-17841 * # **Results from the July 1981 Workshop on Passive Remote Sensing of the Troposphere.** L. S. Keafer, Jr. and H. G. Reichle, Jr. (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0207*. 8 p. 6 refs.

Potential roles of passive remote sensors in the study of the chemistry and related dynamics of the lower atmosphere were defined by a Tropospheric Passive Remote Sensing Workshop, and technology advances required to implement these roles were identified. A promising role is in making global-scale, multilayer measurements of the more abundant trace tropospheric gaseous species (e.g., O3, CO, CH4, HNO3) and of aerosol thickness and size distribution. It includes both nadir- and limb-viewing measurements. Technology advances focus on both scanning- and fixed-spectra, nadir-viewing techniques with resolutions of 0.1 kaysers or better. Balloon- and Shuttle-borne experiments should be performed to study the effects of instrument noise and background fluctuations on data inversion and to determine the utility of simultaneously obtained nadir- and limb-viewing data. AGRICULTURE AND FORESTRY

Includes crop forecasts, crop signature analysis, soil identification, disease detection, harvest estimates, range resources, timber inventory, forest fire detection, and wildlife migration patterns.

A82-10039 **The effect of angular factors on popularly used indicators of vegetative vigor.** M. J. Duggin (New York, State University, Syracuse, NY). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p.239-251. 19 refs.

Ground-based radiometric measurements of reflectance and radiometric data from airborne and spaceborne multispectral scanners and cameras have been used to experimentally determine biomass, vegetative cover, leaf area index, plant height, and disease severity for crops and (for some of these variables) for pastures. In studies so far reported, little or no attention has been given to the effect of sun-detector geometry on popular indices of these variables. It is shown using an experimental model that, for several different pasture targets, each angular variable (solar zenith angle, solar azimuth, and look angle) has an important effect on each of the indices. This implies that care is required in selecting angular regimes for the collection of data which can be interpreted unambiguously and for the meaningful comparison of data obtained on different occasions. B.J.

A82-10040 **Remote sensing techniques in the study of the agricultural potential of soils under the Cerrado vegetation /Brazil/.** G. J. Garcia and R. P. Harris (Universidade Estadual Paulista, Botucatu, São Paulo, Brazil). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 252-260. 8 refs. Research supported by the Fundação de Amparo à Pesquisa do Estado de São Paulo.

A82-10041 **Mapping vegetation association boundaries with Landsat MSS data - An Oklahoma example.** J. A. Harrington, Jr. and C. W. Dunn, Jr. (Oklahoma, University, Norman, OK). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 270-281. 15 refs.

The transition from oak forest to prairie grassland in central Oklahoma provides an excellent area to test the feasibility of using Landsat satellite remote sensing for vegetation mapping. An east-west oriented transect across the ecotone was identified as a study area for testing the mapping accuracy that is obtainable with both computer processing of the digital data and traditional aerial photographic interpretation of Landsat false color composites. Acreage statistics and locational measures of Landsat derived forest cover maps are compared with ground truth information obtained from interpretation of large scale panchromatic photography to suggest the relative accuracy of the analysis techniques. Potential applications of the use of Landsat satellite data for vegetation mapping are identified. (Author)

A82-10042 **Phytoecozonation of Sevier Lake region of Utah using digitized Landsat MSS data.** K. Lulla and P. Mausel (Indiana State University, Terre Haute, IN). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p.282-292. 10 refs.

The practicality and value of Landsat MSS digital data using computer-assisted techniques were examined in a study of regional level phytoecozone identification in the Sevier Lake region of the Great Basin of Utah. Four band spectral responses from Landsat scene 73500200 (May 22, 1973) were converted into principal component (PC) and biomass ratios. Unsupervised results clearly indicate that Landsat MSS data in PC and biomass ratio form can be used to delineate major phytoecozone patterns at a map scale of 1:500,000 and also provide selected zonation information at 1:120,000 scale and larger. It was also found that combining PC, biomass ratio, and some original Landsat data gave the best results for delineating phytoecozone regions using nonparametric supervised classification techniques. B.J.

A82-10046 **Limitations in the spectral discrimination of the Landsat MSS.** M. J. Duggin (New York, State University, Syracuse, NY) and P. J. Ellis (Department of Scientific and Industrial Research, Physics and Engineering Laboratory, Lower Hutt, New Zealand). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p.329-334. 7 refs.

The variation between the mean value in output for one bandpass for the Landsat 1, 2, and 3 multispectral scanners is nearly 10% for a target that shows variations in spectral response across the bandpass (e.g., vegetation) but is less than 1% for a target that does not (e.g., soil). This paper examines the above differences for real vegetation and soil targets to show that the differences in output between the channels for a given band of a given MSS are target-dependent; that is, striping on the MSS image is target-dependent. It is also shown that in the case of multitemporal studies involving the output of scanners on two or more satellites, the differences in mean output between like channels of scanners are target-dependent, being much larger for a target which shows variations in radiance across the scanner bandpass than for one which does not. B.J.

A82-10047 * **Remote sensing for vineyard management.** W. R. Philipson, T. L. Erb, D. Fernandez, and J. N. McLeester (Cornell University, Ithaca, NY). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p.371-378. Grant No. NGL-33-010-171.

Cornell's Remote Sensing Program has been involved in a continuing investigation to assess the value of remote sensing for vineyard management. Program staff members have conducted a series of site and crop analysis studies. These include: (1) panchromatic aerial photography for planning artificial drainage in a new vineyard; (2) color infrared aerial photography for assessing crop vigor/health; and (3) color infrared aerial photography and aircraft multispectral scanner data for evaluating yield related factors. These studies and their findings are reviewed. (Author)

A82-10048 **Repetitive aerial photography for assessing marsh vegetation changes.** M. G. Weaver, G. H. Cross, and R. A. Mead

(Virginia Polytechnic Institute and State University, Blacksburg, VA). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 395-408. 21 refs. Research supported by the Virginia Commission of Game and Inland Fisheries.

The dynamic conditions of two marshes on the Rappahannock River, Virginia, were investigated using sequential aerial photography. All the historical photography was 9 inch format, black and white panchromatic, and medium scale, purchased from various government agencies. Recent photos were large-scale 35 mm color infrared and natural color positive transparencies. Vegetative classes were delineated on the recent photographs to produce a large-scale 1:2,500 map useful in current resource planning and future monitoring. The black and white historical photos were interpreted using a generalized classification system. Comparisons of changes were made by reducing or enlarging the maps made from the historical and tabularly reducing the current vegetation classes to a common scale of 1:7,000. In addition, muskrat lodges were plotted on all photographs where resolution and quality permitted. Repetitive aerial photographs provided useful information on which to formulate hypotheses that would explain changes in marsh vegetation.

A82-10862 **Stand density estimation on panoramic transparencies.** W. A. Befort, H. N. Anderson (Idaho, University, Moscow, ID), and B. L. Kessler (Idaho Department of Lands, Moscow, ID). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Oct. 1981, p. 1477-1481. 9 refs.

Paired estimates of forest canopy density were made on optical bar panoramic CIR transparencies and on conventional black-and-white prints to see if different results would be obtained. Except in the portions of the photographs beyond about 36 deg of scan angle, estimates made on panoramic photos under 4x stereo magnification were not significantly different from estimates made on conventional photos with a 3x mirror stereoscope. (Author)

A82-10863 * **Spectral behavior of wheat yield variety trials.** J. L. Hatfield (California, University, Davis, CA). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Oct. 1981, p. 1487-1491. 8 refs. Research supported by the U.S. Department of Agriculture; Grant No. NCA2-OR-180-607.

Little variation between varieties is seen at jointing, but the variability is found to increase during grain filling and decline again at maturity. No relationship is found between spectral response and yield, and when yields are segregated into various classes the spectral response is the same. Spring and winter nurseries are found to separate during the reproductive stage because of differences in dates of heading and maturity, but they exhibit similar spectral responses. The transformed normalized difference is at a minimum after the maximum grain weight occurs and the leaves begin to brown and fall off. These data of 100% ground cover demonstrate that it is not possible to predict grain yield from only spectral data. This, however, may not apply when reduced yields are caused by less-than-full ground cover.

A82-10864 **Satellite sensing of irrigation patterns in semiarid areas - An Indian study.** S. Thiruvengadachari (National Remote Sensing Agency, Hyderabad, India). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Oct. 1981, p. 1493-1499. 6 refs.

A82-12884 **Evaluation of digital photographic enhancement for Dutch elm disease detection.** T. M. Lillesand, D. E. Meisner, D. W. French, and W. L. Johnson (Minnesota, University, St. Paul, MN). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Nov. 1981, p. 1581-1592. 11 refs. Research supported by the University of Minnesota.

A82-12886 * **Temporal spectral response of a corn canopy.** B. L. Markham, D. S. Kimes, C. J. Tucker (NASA, Goddard Space Flight Center, Earth Resources Branch, Greenbelt, MD), and J. E. McMurtrey, III (Science and Education Administration, Field Crops Laboratory, Beltsville, MD). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Nov. 1981, p. 1599-1605. 14 refs.

Techniques developed for the prediction of winter wheat yields from remotely sensed data indicating crop status over the growing season are tested for their applicability to corn. Ground-based spectral measurements in the Landsat Thematic Mapper bands 3 (0.62-0.69 microns), 4 (0.76-0.90 microns) and 5 (1.55-1.75 microns) were performed at one-week intervals throughout the growing season for 24 plots of corn, and analyzed to derive spectral ratios and normalized spectral differences of the IR and shortwave IR bands with the red. The ratios of the near IR and shortwave IR bands are found to provide the highest and most consistent correlations with corn yield and dry matter accumulation, however the value of band 5 could not be tested due to the absence of water stress conditions. Integration of spectral ratios over several dates improved the correlations over those of any single date by achieving a seasonal, rather than instantaneous, estimate of crop status. Results point to the desirability of further tests under other growth conditions to determine whether satellite-derived data will be useful in providing corn yield information.

S.C.S.

A82-12887 **Identification of conifer species groupings from Landsat digital classifications.** K. E. Mayer and L. Fox, III (Humboldt State University, Arcata, CA). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Nov. 1981, p. 1607-1614. 12 refs.

The development of computerized classification techniques for timber species groupings in Landsat digital data is discussed in light of the problems of spectrally inhomogeneous training fields, unique patterns not covered by limited numbers of training fields and spectral class labeling encountered in such situations. The combination of guided clustering with unsupervised classification is shown to have allowed inventorying of the timber resources of the McCloud Ranger District of the Shasta-Trinity National Forest in California. To complete the classification spectral classes were assigned to resource categories by the construction of spectral curves for each class from the mean digital values in spectral bands 4, 5, 6 and 7, in association with detailed photointerpretation. An overall classification accuracy for the identification of conifer species groupings, canopy density classes, and crown diameter categories of 0.83 was thus obtained.

S.C.S.

A82-15026 **The discrimination of winter wheat using a growth-state signature.** C. A. Hlavka, R. M. Haralick, S. M. Carlyle, and R. Yokoyama (Kansas, University, Lawrence, KS). *Remote Sensing of Environment,* vol. 9, June 1980, p. 277-294. 21 refs.

In this paper, a multitemporal classification procedure for crops in Landsat scenes is described. The method involves the creation of crop signatures which characterize multispectral observations as functions of phenological growth states. In this approach, crop spectral reflectance is modeled explicitly as a function of maturity rather than a function of date. This means that instead of stacking spectral vectors of one observation on another, as is usually done for multitemporal data, a correspondence of time to growth state is established for each possible crop category which minimizes the difference between the given multispectral multitemporal vector and the category mean vector indexed by growth state. The results of applying it to winter wheat show that the method is capable of discrimination with about the same degree of accuracy as more traditional multitemporal classifiers. It shows some potential to label degree of maturity of the crop without crop condition information in the training set.

V.L.

A82-15038 * **Temporal relationships between spectral response and agronomic variables of a corn canopy.** D. S. Kimes, B. L. Markham, C. J. Tucker (NASA, Goddard Space Flight Center, Earth Resources Branch, Greenbelt, MD), and J. E. McMurtrey, III (U.S. Science and Education Administration, Plant Genetics and Germplasm Institute, Beltsville, MD). *Remote Sensing of Environment,* vol. 11, Nov. 1981, p. 401-411. 15 refs.

Attention is given to an experiment in which spectral radiance data collected in three spectral regions are related to corn canopy variables. The study extends the work of Tucker et al. (1979) in that more detailed measurements of corn canopy variables were made using quantitative techniques. Wet and dry green leaf biomass is considered along with the green leaf area index, chlorotic leaf biomass, chlorotic leaf area, and leaf water content. In addition, spectral data were collected with a hand-held radiometer having Landsat-D Thematic Mapper (TM) bands TM3 (0.63-0.69 micrometers), TM4 (0.76-0.90 micrometers), and TM5 (1.55-1.75 micrometers). TM3, TM4, and TM5 seem to be well situated spectrally for making remotely sensed measurements related to chlorophyll concentration, leaf density, and leaf water content. G.R.

A82-15748 **A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras (Ein VHF-Homing-System mit VHF-Sprechfunk für flächenrepräsentative Streifenbefliegungen mit 70 mm und 35 mm Kameras von leichten Flugzeugen im Rahmen kombinierter Waldinventuren).** B. Rhody (Bundesforschungsanstalt für Forst- und Holzwirtschaft, Hamburg, West Germany). *Bildmessung und Luftbildwesen*, vol. 49, Nov. 1, 1981, p. 199-203. In German.

A82-15963 † **Study and mapping of agricultural land use, based on space images (Izuchenie i kartografirovanie sel'skokhoziaistvennogo ispol'zovaniia zemel' po kosmicheskim snimkam).** L. F. Ianvareva (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). *Issledovanie Zemli iz Kosmosa*, Sept.-Oct. 1981, p. 103-110. In Russian.

The possibilities of using multispectral images obtained at different times by the Fragment system to study the structure of agrarian lands and various forms of agriculture are assessed. A method is described for interpreting the agrarian areas, groups of agricultural cultures, and agrotechnical and land reclamation measures, which are based on a system of external features. The advantages of using space images as compared to ground-based methods are discussed, including the greater regional differentiation of space information. J.F.

A82-15964 † **Mapping of forest vegetation on the basis of space images (Kartografirovanie lesnoi rastitel'nosti po kosmicheskim snimkam).** T. V. Kotova, V. I. Kravtsova, and A. K. Makarevich (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). *Issledovanie Zemli iz Kosmosa*, Sept.-Oct. 1981, p. 111-116. In Russian.

Using the upper reaches of the Northern Dvina river as an example, the possibilities of studying and mapping forests by images obtained by the Fragment system were analyzed. The images were used to separate forest and non-forest areas, and to distinguish the forest areas as either coniferous, mixed, or deciduous. The outlines of forest and nonforest regions with areas greater than 0.5 sq km are established in detail, and the characteristics of the various species are discussed in general terms. J.F.

A82-16162 **Rural development in the humid tropics.** F. C. d'Audretsch and H. F. Gelens (International Institute for Aerial Survey and Earth Sciences, Enschede, Netherlands). *ITC Journal*, no. 3, 1981, p. 266-277.

The status of on-going rural development projects in Southeast Asia was the subject of a seven-week research tour of Thailand, Indonesia and the Philippines. The tour was jointly sponsored by the International Institute for Aerial Survey and Earth Sciences and the United Nations University. The study focused on the development of resources management in agro-forestry, forest conservation, reforestation and settlement in the humid tropics. Problems in the use of aerial photographs and coordination of resource management were identified. S.C.S.

A82-16622 † **Analysis of the information content of the polarimetric method of remote sensing (Analiz informativnosti poliarimetricheskogo metoda distantsionnogo zondirovaniia).** V. V. Egorov and B. S. Zhukov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 203-210. 8 refs. In Russian.

The comparative information content of polarization characteristics in remote sensing studies is analyzed. The optimal combination of spectral-polarization measurements is calculated for actual sets of soil-vegetation objects. Intensity and the degree of optical polarization were found to be the most informative polarization characteristics. B.J.

A82-17564 * **Aircraft radar response to soil moisture.** G. A. Bradley and F. T. Ulaby (University of Kansas Center for Research, Inc., Lawrence, KS). *Remote Sensing of Environment*, vol. 11, Dec. 1981, p. 419-438. 12 refs. Contracts No. NAS9-14052; Grant No. NAG5-30.

An analysis is presented of aircraft response to soil moisture in the upper surface layer of agricultural fields. Measurements (taken at 1.6 GHz and 4.75 GHz using HH and HV polarizations, and at 13.3 GHz using VV polarization from an experiment conducted in 1978 at Colby, Kansas) are used to derive the radar soil moisture sensitivities and correlations. It is shown that the aircraft response to soil moisture is optimum at C-band frequencies and incidence angles of 10-20 deg. confirming previous truck-radar results. Like-polarization radar response is unaffected by vegetation but is dependent on row-tillage patterns; cross-polarization response also is unaffected by vegetation but is approximately independent of tillage patterns. These results show that remote sensing radars can be used effectively for the detection and estimation of near-surface soil moisture in agricultural fields. (Author)

A82-17997 **Remote sensing of crop moisture status.** B. L. Blad, B. R. Gardner, D. G. Watts, and N. J. Rosenberg (Nebraska, University, Lincoln, NE). *Remote Sensing Quarterly*, vol. 3, Apr. 1981, p. 4-20. 11 refs. Research sponsored by the University of Nebraska.

Relations between crop temperatures and levels of water stress are determined to serve as a basis for the remote sensing of the extent and severity of water stress according to thermal imagery. Experiments were performed on stands of sorghum and corn grown near Mead and North Platte, Nebraska, respectively, under either full irrigation, a water gradient during the vegetative, pollination and grain-fill periods, or dryland conditions. Thermal imagery acquired at altitudes of 610 and 1220 m reveals the irrigated and nonirrigated sorghum plots to display the same temperatures in the morning, while the nonirrigated plot was a few degrees warmer in the afternoon and exhibited considerable temperature variability. Mid-afternoon temperature differences of up to 12.8 C are found in the corn plots accompanied by a great amount of interplot variability. Significant changes in crop temperature, particularly on nonirrigated lands, are observed under variably cloudy skies, making it difficult to quantify the degree of stress under these conditions from temperature data. The data reveal the optimum time of day for detecting maximum plant temperatures to be between 1300 and 1500 h. Crop temperatures measured by attached leaf thermocouples are found to be within 1.2 and 2.6 C of IR thermometer temperatures for the unstressed and stressed plants, respectively. Finally, differences in seasonal evapotranspiration are found to be correlated with seasonally accumulated temperature differences. A.L.W.

A82-17998 **The use of digitally processed Landsat imagery for vegetation mapping in Sulawesi, Indonesia.** R. M. Warwick-Smith (London, University, London, England). *Remote Sensing Quarterly*, vol. 3, Apr. 1981, p. 21-26. 13 refs. Research supported by the Royal Aircraft Establishment.

INCLUSION OF A SIMPLE VEGETATION LAYER IN TERRAIN TEMPERATURE MODELS FOR THERMAL INFRARED (IR) SIGNATURE PREDICTION Final Report, 1 Oct. 1979 - 1 Oct. 1980
Lee K. Balick, Randy K. Scoggins, and Lewis E. Link, Jr. Aug. 1981 44 p refs
(DA Proj. 4A7-62730-AT-42; DA Proj. 4A7-62719-AT-40)
(AD-A104469; WES/MP/EL-81-4) Avail: NTIS HC A03/MF A01 CSCL 17/5

Thermal infrared signatures of natural and cultural features are dynamic, varying with time and weather conditions. Prediction of thermal signatures for specific conditions requires first that the actual temperature of the features be determined; for vegetation canopies this involves the average temperatures of canopy components and for planar (nonvegetated) surfaces the temperature of the surface. Models have been developed to handle layered vegetation canopies and layered ground surfaces; however, efforts have only begun to formulate a comparable capability for intermediate conditions such as grass covered surfaces where both the terrain surface and vegetation influence the average surface temperature. This report presents a procedure, named VEGIE, that predicts the temperature of terrain surfaces which contain a simple layer of vegetation. VEGIE is designed as an interim procedure for immediate application in lieu of more sophisticated and theoretical treatments of this problem. Operational flexibility and simplicity are preserved by using VEGIE as a submodel to the Terrain Surface Temperature Model (TSTM) developed previously at the U.S. Army Engineer Waterways Experiment Station. The TSTM predicts the surface temperature of nonvegetated layer and planar features using material thermophysical properties and meteorological conditions. These models are applied to a deciduous and a coniferous canopy where the CSU model is valid but VEGIE is not. VEGIE is applied to the problem of estimating thermal signatures for terrain surfaces with less than total foliage cover, the consequences of changes in foliage cover, differing emissivities for the soil and vegetation, and reflected sky radiation. VEGETATION PATTERNS
David M. Carneggie and Brain T. Fine (California Univ. at Davis) *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 243-262 refs

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08F

In an effort to make meaningful observations of vegetation resources, the following sites and features were examined: (1) wheat in Argentina, Australia, and the U.S.; (2) rangelands in Australia, Africa, and the U.S.; (3) land use in Malaysia; (4) vegetation in New Zealand; (5) agriculture in California; (6) drought in northern Australia; (7) insect and disease damage in any of the sites; and (8) forest and range fires wherever found. The important factors that governed the ability of the crew to observe these features were angle of view from the spacecraft; atmospheric conditions; Sun angle; speed of the spacecraft; characteristics of natural and cultivated vegetation; and familiarity with the phenomena to be observed. User reaction to the imagery is discussed and photograph quality is evaluated. A.R.H.

A labeling technique is described which seeks to associate a sampling entity with a particular crop or crop group based on similarity of growing season and temporal-spectral patterns of development. Human analyst provide contextual information, after which labeling decisions are made automatically. Results of a test of the technique on a large, multi-year data set are reported. Grain labeling accuracies are similar to those achieved by human analysis techniques, while non-grain accuracies are lower. Recommendations for improvments and implications of the test results are discussed. Author

Specific case studies undertaken to demonstrate the usefulness of remote sensing technology to resource managers in California are highlighted. Applications discussed include the mapping and quantization of wildland fire fuels in Mendocino and Shasta Counties as well as in the Central Valley; the development of a digital spectral/terrain data set for Colusa County; the Forsythe Planning Experiment to maximize the usefulness of inputs from LANDSAT and geographic information systems to county planning in Mendocino County; the development of a digital data bank for Big Basin State Park in Santa Cruz County; the detection of salinity related cotton canopy reflectance differences in the Central Valley; and the surveying of avocado acreage and that of other fruits and nut crops in Southern California. Special studies include the interpretability of high altitude, large format photography of forested areas for coordinated resource planning using U-2 photographs of the NASA Bucks Lake Forestry test site in the Plumas National Forest in the Sierra Nevada Mountains. WHEAT CULTIVATION: IDENTIFICATION AND ESTIMATION OF AREAS USING LANDSAT DATA [CULTURA DO TRIGO IDENTIFICACAO E AVALIACAO DE AREAS ATRAVES DE DADOS DO LANDSAT]
Nelson deJesusParada, Principal Investigator, Francisco Jose Mendonca, Dali Arthur Cottrell, Antonio Tebaldi Tardin, David Chung Liang Lee, Yosio Edemir Shimabukuro, Mauricio Alves Moreira, and Angela Maria deLimaeFernandoCelsoSoaresMaia May 1981 5 p refs In PORTUGUESE Sponsored by NASA ERTS
(E82-10007; NASA-CR-164905; INPE-2054-RPE/300) Avail: NTIS HC A02/MF A01 CSCL 02C

The feasibility of using automatically processed multispectral data obtained from LANDSAT to identify wheat and estimate the areas planted with this grain was investigated. Three 20 km by 40 km segments in a wheat growing region of Rio Grande do Sul were serially photographed using type 2443 Aerochrome film. Three maps corresponding to each segment were obtained from the analysis of the photographs which identified wheat, barley, fallow land, prepared soil, forests, and reforested land. Using basic information about the fields and maps made from the photographed areas, an automatic classification of wheat

was made using MSS data from two different periods: July to September and July to October 1979. Results show that orbital data is not only useful in characterizing the growth of wheat, but also provides information of the intensity and extent of adverse climate which affects cultivation. The temporal and spatial characteristics of LANDSAT data are also demonstrated.

ENVIRONMENTAL CHANGES AND CULTURAL RESOURCES

Includes land use analysis, urban and metropolitan studies, environmental impact, air and water pollution, geographic information systems, and geographic analysis.

A82-10034 * **Introducing remote sensing to county-level agencies in Michigan through the Cooperative Extension Service.** W. R. Enslin and R. Hill-Rowley (Michigan State University, East Lansing, MI). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 157-164. 11 refs. Research supported by the Michigan State University; Grant No. NGL-23-004-083.

State and regional planning agencies in Michigan are aware of remote sensing technology, however, many agencies at the county and township level have not been introduced to its potential. This paper describes an educational effort undertaken by the MSU Remote Sensing Project and the Michigan Cooperative Extension Service aimed at reaching local decision makers. Remote sensing materials and a questionnaire were used to elicit interest and aid in planning the program. A series of seven workshops were held throughout Michigan for governmental officials and the staff of public agencies from 38 counties. Emphasis was placed on the characteristics, availability and usefulness of remotely-sensed data through a series of successful applications conducted in the state. The workshops were highly successful and many local decision makers are not aware of a new tool to call upon in their responses to land use and natural resource concerns. (Author)

A82-10043 * **An improvement in land cover classification achieved by merging microwave data with Landsat multispectral scanner data.** S. T. Wu (NASA, National Space Technology Laboratories, Earth Resources Laboratory, Bay St. Louis, MS). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 293-309. 5 refs.

The improvement in land cover classification achieved by merging microwave data with Landsat MSS data is examined. To produce a merged data set for analysis and comparison, a registration procedure by which a set of Seasat SAR digital data was merged with the MSS data is described. The Landsat MSS data and the merged Landsat/Seasat data sets were processed using conventional multichannel spectral pattern recognition techniques. An analysis of the classified data sets indicates that while Landsat data delineate different forest types (i.e., deciduous/coniferous) and allow some species separation, SAR data provide additional information related to plant canopy configuration and vegetation density as associated with varying water regimes, and therefore allow for further subdivision in the classification of forested wetlands of the coastal region of the southern United States. B.J.

A82-10044 * **Preliminary results of mapping urban land cover with Seasat SAR imagery.** F. M. Henderson (New York, State University, Albany, NY), S. W. Wharton, and D. L. Toll (NASA, Goddard Space Flight Center, Greenbelt, MD). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 310-317.

The detectability of urban land cover types is explored using digitally processed Seasat SAR imagery of the Denver, Colorado area. Test sites within the metropolitan area were selected to include a cross section of Anderson, et. al. Level II land cover classes and cover types representative of the urban area growth stages. Using the Image 100 interactive processing system each test site was level sliced in an attempt to define specific reflectance boundaries for each cover type and to determine the spectral and spatial characteristics of homogeneous response regions. The rural-urban fringe boundary was readily definable, but a precise Level I and Level II land cover classification was not possible. High density housing could be separated from low density housing and from parks, but reflectance values were often look angle dependent. Confusion between some water and vegetation responses also posed problems. (Author)

A82-10616 **An investigation of a polar low with a spiral cloud structure.** E. Rasmussen (Copenhagen, University, Copenhagen, Denmark). *Journal of the Atmospheric Sciences*, vol. 38, Aug. 1981, p. 1785-1792. 9 refs.

A synoptic case study where a small-scale low, a so-called polar low, can be followed as a closed circulation on the surface maps around 2000 km from Iceland to the North Sea is presented. Satellite images show that the polar low develops a cloud pattern of convective clouds very much like that of a tropical cyclone. The 1000-500 mb thickness field shows that the polar low has a warm core during the time when it is best developed. It is concluded that the polar low discussed in this work probably is a phenomenon different from a comma cloud and also different from small-scale vortices associated with strong mid-tropospheric positive vorticity advection. (Author)

A82-10700 **Trace pollutant concentrations in a multiday smog episode in the California South Coast Air Basin by long path length Fourier transform infrared spectroscopy.** E. C. Tuazon, A. M. Winer, and J. N. Pitts, Jr. (California, University, Riverside, CA). *Environmental Science and Technology*, vol. 15, Oct. 1981, p. 1232-1237. 48 refs. U.S. Environmental Protection Agency Grant No. R-804546.

A82-11949 * **Automated analyzer for aircraft measurements of atmospheric methane and total hydrocarbons.** W. R. Cofer, III and G. C. Purgold (NASA, Langley Research Center, Hampton, VA). *Review of Scientific Instruments*, vol. 52, Oct. 1981, p. 1560-1564. 10 refs.

An automated methane/total hydrocarbon analyzer is presented, which can produce alternate methane/total hydrocarbon measurements every 7 seconds to provide the spatial resolution required for regional hydrocarbon measurements at aircraft speeds. The construction and sampling techniques developed for the aircraft mounted system are discussed. A technique to periodically measure atmosphere oxygen is incorporated into the analyzer to ensure accurate hydrocarbon measurements, and a data collection methodology is developed to minimize errors resulting from changes in flame ionization detector sensitivity at different altitudes. Aircraft data acquired at the 1979 Southeastern Virginia Urban Plume Study are also presented, which illustrate the application of the instrument to a troposphere pollution plume. D.L.G.

A82-12517 # **Spacelab-research of European regions with strong negative environmental influences, based on AVHRR-data of the satellites Tiros-N and NOAA.** H. Kaminski. In: International Scientific Conference on Space, 21st, Rome, Italy, March 25, 26, 1981, Proceedings. Rome, Rassegna Internazionale Elettronica Nucleare ed Aerospaziale, 1981, p. 197-206. 10 refs.

Remote sensing data from the Tiros-N-AVHRR satellites are considered as a base for further appraisals of air and water pollution in Europe by multispectral scanning from Spacelab. A short program is envisioned to verify the 10% anthropogenous induced clouding increase due to air traffic, as an aid to land use planning. Zones of meadows and woods between large towns are noted to be areas with no significant atmospheric heat build-up. Pollution from the Rhine and Po rivers has been sensed in the infrared and found to remain in coastal areas, mixing too slowly with sea water to disperse. A recommendation is offered to change the declination of Spacelab's orbit from 50 to 55 deg to allow more accurate sensing of pollutant problems in Belgium, the Netherlands, West Germany, and Italian industrialized regions. M.S.K.

A82-12591 **Areawide soil loss predictions using CIR airphotos.** K. M. Morgan (Texas Christian University, Fort Worth, TX) and R. Nalepa. In: Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, Madison, WI, August 13, 14, 1980. New York, American Society of Civil

Engineers, 1980, p. 24-32. 10 refs. Research supported by the Texas Christian University Research Foundation.

It is pointed out that the Universal Soil Loss Equation (USLE) is a widely accepted tool for erosion prediction and conservation planning. In this study, manual interpretation of color infrared photography is used, along with the USLE and a computer-land information system, to identify critical areas of soil loss in Quil Miller Creek watershed in Johnson County, Texas. The low altitude color infrared photos used to record land use activities are at a scale of 1:48,000. C.R.

A82-12594 **Remote sensing that motivated community action.** R. H. Brownlee, J. P. Scherz (Wisconsin, University, Madison, WI), and J. M. Dennis (Chetek High School, Chetek, WI). In: Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, Madison, WI, August 13, 14, 1980. New York, American Society of Civil Engineers, 1980, p. 60-77.

An account is given of the way in which the algal problem afflicting Prairie Lake, near Chetek, Wisconsin, was solved. Lake classification schemes developed at the University of Wisconsin with Multispectral Landsat Analysis indicated the source of pollution to be at the mouth of Rice Creek, which emptied into the lake. High-level and low-level aerial photos of the creek showed a cattle feedlot located near springs which fed into the creek. When residents of the area were shown the remote sensing data, they took steps to ensure that fewer cows used the spring. This solved the problem. C.R.

A82-12816 **Study of stack emissions by combination of lidar and correlation spectrometer.** P. Camagni, E. De Blust, C. Koechler, R. Michelon, A. Pedrini, M. De Groot, and S. Sandroni (Commission of the European Communities, Joint Research Centre, Ispra, Italy). *Nuovo Cimento C, Serie 1,* vol. 4C, May-June 1981, p. 359-371. 6 refs.

Examples are presented of the application of the combined techniques of lidar and correlation spectrometry to the monitoring of stack plume pollutants. Following a brief review of the principles of lidar observation of scattering particle spatial distribution and mask correlation spectrometer determination of gas integral-path thickness, attention is given to the results of combined measurements of particle and SO2 distributions above the three tallest stacks of the ENEL power plant at Turbigo, Italy. It is found that the plume aerosols behave differently from the gas component, which result demonstrates the potential of the combination technique in mass balance and mass flow evaluation. A.L.W.

A82-13268 * **Nitric oxide delta band emission in the earth's atmosphere - Comparison of a measurement and a theory.** D. W. Rusch (Colorado, University, Boulder, CO) and W. E. Sharp (Michigan, University, Ann Arbor, MI). *Journal of Geophysical Research,* vol. 86, Nov. 1, 1981, p. 10111-10114. 21 refs. Grants No. NsG-5372; No. NGR-23-005-360.

Attention is given to the altitude dependent emission rate in the delta-bands of nitric oxide as measured in the earth's atmosphere at night by a scanning ultraviolet spectrometer. It is noted that the reaction responsible is the two-body association of nitrogen and oxygen atoms. The measurements show a vertical intensity beneath the layer for the delta-band system of 19 R. The horizontal emission rate is found to increase from 70 R at 117 km to 140 R at 150 km. The data are analyzed with a one-dimensional, time-dependent, vertical-transport model of odd nitrogen photochemistry. The calculated and measured intensities agree so long as the quenching of N(2D) by atomic oxygen is near 5 x 10 to the -13 cu cm/sec. C.R.

A82-14320 **Radiative heating rates and some optical properties of the St. Louis aerosol, as inferred from aircraft measurements.** T. J. Method and T. N. Carlson (Pennsylvania State University, University Park, PA). *Atmospheric Environment,* vol. 16, no. 1, 1982, p. 53-66. 25 refs. U.S. Environmental Protection Agency Grants No. R-805500-01; No. R-806048-01-2.

Analyses of airborne measurements of solar and terrestrial radiation and aerosol profile measurements of the St. Louis boundary layer collected during two summers are summarized. Spectral pyranometers, radiometers, a pyrgeometer, an automatic particle counter, and an integrating nephelometer were used to collect data samples on 20 profile flights. Estimates of the vertical flux divergence and aerosol heating rates for solar, longwave, and total spectrum fluxes, in addition to total bulk estimates of aerosol parameters are provided. Results include a maximum aerosol heating in the visible exceeding three C/day near the bottom of the mixing layer, solar heating near one C/day near the ground, and zero heating near the top of the mixing layer. The total short and longwave radiative heating rates were slightly negative; with large particle aerosol concentration, the greatest extinction was near the surface. It is concluded that although St. Louis has a slightly greater aerosol loading than surrounding rural areas, the findings do not differ greatly from weakly absorbing natural soil particles commonly observed over nonurban and semiarid regions. M.S.K.

A82-15027 **Thermal inertia, thermal admittance, and the effect of layers.** G. F. Byrne and J. R. Davis (Commonwealth Scientific and Industrial Research Organization, Div. of Land Use Research, Canberra, Australia). *Remote Sensing of Environment,* vol. 9, June 1980, p. 295-300. 12 refs.

The effect of a diurnally varying flux on a solid surface is analysed in terms of thermal admittance, the reciprocal of complex thermal conductance. The presence of a surface layer of differing thermal characteristics from the bulk material, which can significantly affect the phase and amplitude of the temperature wave of the exposed surface, is discussed in terms of the admittance concept. It is suggested that the latter concept provides a better approach to the characterization of solid surfaces, particularly in the remote sensing context where varying water contents or organic materials are involved. (Author)

A82-15749 **Aerial-photography flights over Upper Franconia in 1980 - Operation and first application-related experience (Die Luftbildbefliegung Oberfranken 1980 - Ablauf und erste Anwendungserfahrungen).** B. Arnal (Höhere Landesplanungsbehörde, Bayreuth, West Germany). *Bildmessung und Luftbildwesen,* vol. 49, Nov. 1, 1981, p. 205-208. In German.

A82-15965 1 **Study of the anthropogenic influence on the environment, based on multispectral scanning images (Izuchenie antropogennogo vozdeistviia na prirodnuiu sredu po materialam mnogozonal'noi skanernoi s'emki).** V. I. Kravtsova and I. S. Nizkaia (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* Sept.-Oct. 1981, p. 117-123. In Russian.

The possibilities of using images obtained by the Fragment multispectral scanning system to study the anthropogenic influence on the environment are analyzed. The analysis uses the taiga regions of the north European part of the USSR and the desert regions of Central Asia as examples. Maps are compiled of the anthropogenic influence on forest vegetation in the Kotlas region and on the desert landscapes of the central Ustiurt plateau. It is shown that the data obtained by the Fragment system are useful for establishing the occurrence, character, and degree of landscape changes; it can be used to compile thematic maps, to make recommendations on the use of resources, and to predict unfavorable effects of intense anthropogenic influences. J.F.

A82-15966 1 **Investigation and mapping of the erosion relief of the Kalachskaia upland on the basis of multispectral scanner images (Izuchenie i kartografirovanie erozionnogo rel'efa Kalachskoi vozvyshennosti po mnogozonal'nym skanernym snimkam).** N. I. Lapteva and N. N. Tal'skaia (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* Sept.-Oct. 1981, p. 124-129. 5 refs. In Russian.

Geomorphological, lithological, and erosion maps were compiled for the Kalachskaia upland on the basis of the interpretation of multispectral scanner images obtained in different seasons with the Meteor-satellite Fragment system. The resolution and reliability of the images make it possible to convey the morphological structural plan of the region, the natural pattern, and the density of valleys and ravines. It is shown that the Fragment images can be effectively used to study the erosion relief of plains and to compile medium-scale geomorphological maps. B.J.

A82-15967 † Space photographs obtained with the Fragment system as a base for landscape mapping and physical-geographical classification of arid territories (Kosmicheskie snimki, poluchennye sistemoi 'Fragment' kak osnova landshaftnogo kartografirovaniia i fiziko-geograficheskogo raionirovaniia aridnykh territorii). L. I. Ivashutina and V. A. Nikolaev (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). *Issledovanie Zemli iz Kosmosa*, Sept.-Oct. 1981, p. 130-138. 9 refs. In Russian.

Space images obtained with the Meteor-satellite Fragment system have high landscape resolution and make it possible to investigate landscape structures of arid territories on several geosystem levels, from natural landscapes to physical-geographical regions. Detailed medium-scale landscape schemes of the southern Mugodzhar desert regions and of the northern Ustiurt were composed along with a consolidated scheme of physical-geographical division. Various interpretation criteria were used, the most important of which were optical density and image pattern. B.J.

A82-15968 Analysis of variance of thematic mapping experiment data. G. H. Rosenfield (U.S. Geological Survey, Reston, VA). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Dec. 1981, p. 1685-1692. 23 refs.

The considered study has the objective to determine and document for the remote sensing researcher the minimum statistical methodology needed to perform and interpret an analysis of variance experiment. To illustrate the procedures, a set of data from the National Land Use and Land Cover Mapping Program of the U.S. Geological Survey was used. The set of proportions of correctly interpreted test data was subjected to three treatments of transformation as suggested by Snedecor and Cochran (1967). The transformed data were tested for the three assumptions of analysis of variance, taking into account normality, homogeneity of variance, and additivity. A weighted analysis of variance was performed, and multiple range tests were applied to those computed means deemed significant. From this research, a data analysis method and an operational computer program were developed to assist the analyst in considering the theoretical statistical concepts that are important for solving this type of problem. G.R.

A82-16325 Upper tropospheric cyclonic vortices in the tropical South Atlantic. V. E. Kousky and M. A. Gan (Conselho Nacional de Desenvolvimento Cientifico e Tecnológico, Instituto de Pesquisas Especiais, São Jose dos Campos, São Paulo, Brazil). *Tellus*, vol. 33, Dec. 1981, p. 538-551. 15 refs. Financiadora de Estudos e Projetos Contract No. B/28-79-002-00-00; Conselho Nacional de Pesquisas Contract No. 37/78.

An analysis of subtropical 200 mb cyclones is made for the South Atlantic. The cyclones are observed to occur primarily during the summer months and generally form near the axes of the mid-oceanic troughs. The relationship between cyclone formation and the presence of 200 mb anticyclones over the continental areas is discussed. Proposed mechanisms for cyclone formation are considered. The cyclones are characterized by a cold core and a direct thermal circulation - the cold air sinking and warm air on the periphery rising. The cloud pattern associated with the cyclones is found to depend on the direct thermal circulation, the vortex location and its direction of movement. The effects of South Atlantic 200 mb cyclonic vortices on Brazilian weather are discussed. (Author)

A82-16619 † Polarimetric surveys of oil slicks (Poliarizatsionnaia s'emka neftianykh zagriaznenii vodnoi poverkhnosti). B. S. Zhukov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 175-188. 16 refs. In Russian.

A theoretical study is presented of polarimetric remote-sensing surveys of oil slicks. The oil-water contrast is calculated as a function of the polarimetric analyzer, the spectral range, the thickness of the slick, and the transparence of the water. The influence of the atmosphere on the remote measurements of oil slicks is analyzed, and polarimetric measurement data on oil slicks are presented. B.J.

A82-16837 • A new method for inferring carbon monoxide concentrations from gas filter radiometer data. H. A. Wallio, H. G. Reichle, Jr. (NASA, Langley Research Center, Hampton, VA), J. C. Casas (Old Dominion University, Norfolk, VA), and B. B. Gormsen (Systems and Applied Sciences Corp., Hampton, VA). In: Conference on Atmospheric Radiation, 4th, Toronto, Canada, June 16-18, 1981, Preprints. Conference sponsored by the American Meteorological Society. Boston, MA, American Meteorological Society, 1981, p. 248-254. 14 refs.

A method for inferring carbon monoxide concentrations from gas filter radiometer data is presented. The technique can closely approximate the results of more costly line-by-line radiative transfer calculations over a wide range of altitudes, ground temperatures, and carbon monoxide concentrations. The technique can also be used over a larger range of conditions than those used for the regression analysis. Because the influence of the carbon monoxide mixing ratio requires only addition, multiplication and a minimum of logic, the method can be implemented on very small computers or microprocessors. D.L.G.

A82-17841 • # Results from the July 1981 Workshop on Passive Remote Sensing of the Troposphere. L. S. Keafer, Jr. and H. G. Reichle, Jr. (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0207*. 8 p. 6 refs.

Potential roles of passive remote sensors in the study of the chemistry and related dynamics of the lower atmosphere were defined by a Tropospheric Passive Remote Sensing Workshop, and technology advances required to implement these roles were identified. A promising role is in making global-scale, multilayer measurements of the more abundant trace tropospheric gaseous species (e.g., O3, CO, CH4, HNO3) and of aerosol thickness and size distribution. It includes both nadir- and limb-viewing measurements. Technology advances focus on both scanning- and fixed-spectra, nadir-viewing techniques with resolutions of 0.1 kaysers or better. Balloon- and Shuttle-borne experiments should be performed to study the effects of instrument noise and background fluctuations on data inversion and to determine the utility of simultaneously obtained nadir- and limb-viewing data. (Author)

A82-18052 # The radiowave propagation environment - Science and technology objectives for the 80's. J. M. Goodman (U.S. Navy, E. O. Hulburt Center for Space Research, Washington, DC) and J. Aarons (USAF, Geophysics Laboratory, Bedford, MA). In: Symposium on the Effect of the Ionosphere on Radiowave Systems, Washington, DC, April 14-16, 1981, Preprints.
Washington, DC, U.S. Naval Research Laboratory, 1981. 10 p.

The ionosphere has a strong influence on the personality of radiowaves which propagate beneath, within, or through it; and this influence derives from the spatial and temporal nonuniformity in the refractivity of the magneto-ionic medium. Basic research objectives in environmental monitoring are examined, taking into account ionospheric research, magnetospheric research, interplanetary field and solar wind research, solar radiation and magnetic field research, and propagation studies. Operational systems which basic research will support are related to communications systems, navigation systems, and surveillance. Environmental effects/system deficiencies by frequency band are discussed, giving attention to the ELF frequency band (30-300 Hz), the VLF band (3-30 kHz), the MF/HF band (300 kHz - 30 MHz), and the UHF/SHF (300 MHz - 30 GHz). It is concluded that there is already a need to study the ionosphere and its coupling to the magnetosphere above and the troposphere below in order to more fully develop the insight required to specify the radiowave propagation effects introduced by the various media. HC A05/MF A01 CSCL 08M

Rainfall-amount patterns in the central regions of the U.S.

were assessed. The spatial scales of surface features and their corresponding microwave responses in the mid western U.S. were investigated. The usefulness for U.S. government agencies of soil moisture information at scales of 10 km and 1 km. was ascertained. From an investigation of 494 storms, it was found that the rainfall resulting from the passage of most types of storms produces patterns which can be resolved on a 10 km scale. The land features causing the greatest problem in the sensing of soil moisture over large agricultural areas with a radiometer are bodies of water. Over the mid-western portions of the U.S., water occupies less than 2% of the total area, the consequently, the water bodies will not have a significant impact on the mapping of soil moisture. Over most of the areas, measurements at a 10-km resolution would adequately define the distribution of soil moisture. Crop yield models and hydrological models would give improved results if soil moisture information at scales of 10 km was available.

RADAR MAPPING, ARCHAEOLOGY, AND ANCIENT LAND USE IN THE MAYA LOWLANDS
R. E. W. Adams (Cambridge Univ.), W. E. Brown, Jr., and T. Patrick Culbert (Arizona Univ.) 31 Mar. 1981 27 p refs
(Contract NAS7-100)
(NASA-CR-164931) Avail: NTIS HC A03/MF A01 CSCL 08B

Data from the use of synthetic aperture radar in aerial survey of the southern Maya lowlands suggest the presence of very large areas drained by ancient canals for the purpose of intensive cultivation. Preliminary ground checks in several very limited areas confirm the existence of canals and raised fields. Excavations and ground surveys by several scholars provide valuable comparative information. Taken together, the new data suggest that Late Classic period Maya civilization was firmly grounded in large-scale and intensive cultivation of swampy zones. A.R.H.

A METHOD FOR USING AERIAL PHOTOS IN DELINEATING HISTORIC PATTERNS OF BEACH ACCRETION AND RETREAT
Dennis Hwang Dec. 1980 50 p refs
(Contract NA79AA-D-00085)
(PB81-223836; UNIHI-SG-CR-81-04; NOAA-81042706) Avail: NTIS HC A03/MF A01 CSCL 08C

A method is presented with a maximum estimated error of about 12 feet for measuring beach changes. This is believed to be an accurate estimate, as indicated by a comparison of field and photographic measurements and by the consistent distances obtained for nearby sections of the beach in the Kailua pilot study. The methods described in this report were applied for a pilot study of Kailua Beach.

SHUTTLE APPLICATIONS IN TROPOSPHERIC AIR QUALITY OBSERVATIONS Final Report
E. Friedman, J. Gupta, and J. Carmichael Aug. 1978 122 p refs Sponsored by NASA
(Contract F19628-78-C-001)
(NASA-CR-145374) Avail: NTIS HC A06/MF A01 CSCL 13B

The role which might be played by the space shuttle in obtaining data which describes the air quality of the north-eastern United States was investigated. The data requirements of users, a model for statistical interpretation of the observations, the influence of orbit parameters on the spatial and temporal sampling and an example of application of the the model were considered.

Field test data were analyzed and computer simulations performed to validate the predictions of an earlier study, which calculated the minimum detectable quantities (MDQ's) of trace gases that can be detected remotely using high-resolution spectroscopy. The study demonstrates convincingly that reliable detection can be achieved near the MDQ level in a benign real-world environment.

Radionuclides are potentially released from five technical areas from the laboratories research activities. The program searches for cesium-137, tritium, uranum, alpha emitters, and beta emitters in water, soil, air, and vegetation. No activity was found in public areas in excess of that found in local background in 1980. The Albuquerque population receives only 0.11 person-rem (estimated) from airborne radioactive releases. While national security research is the laboratories major responsibility, energy research is a major area of activity. Both these research areas cause radioactive releases.

ADAPTATION OF LAND USE TO SURFICIAL GEOLOGY IN METROPOLITAN WASHINGTON, D.C. Ph.D. Thesis
Robert Houston Alexander 1981 236 p
Avail: Univ. Microfilms Order No. 8121177

Implicit in the investigation is a process of communicating geologic information, and incorporating such information into land-use decisions. Land-use data were derived from high-altitude color infrared aerial photography, and the information on geologic suitability was obtained from a U.S. Geological Survey map of landforms and surface materials compiled to aid non-geologists in land use planning decisions. The new map was further interpreted and subdivided into those areas geologically suitable and unsuitable for residential and agricultural uses, respectively. The study found significant relationships among land uses and geologic map units, and significant differences in land-use and geologic suitability regimes in subregions based on distance from city center. More recently-developed areas near the urban core have higher proportional associations of residential and agricultural land use with appropriate surficial geologic characteristics than do the outlying areas on the metropolitan fringe. CULTURAL FEATURES IMAGED AND OBSERVED FROM SKYLAB 4
Robert K. Holz *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 225-242 refs

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08B

Data from Skylab 4 observations of metropolitan complexes are limited to city outline, major transportation arteries, suburban built-up areas, overall textural patterns of the city as compared to those of adjacent areas, and the color or albedo. Typical agricultural patterns, forest regions, and transportation networks on rural landscapes can be discerned, as well as the disturbances of soil during construction and mining which expose surface materials of a different albedo. Photographs of Denver, Colorado; San Antonio, Texas, Chicago, Illinois, and San Diego, California are analyzed.

QUANTITATIVE ANALYSIS OF ATMOSPHERIC POLLUTION PHENOMENA
Darryl Randerson *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 381-406 refs

Avail: NTIS MF A01; SOD HC $16.50 CSCL 13B

Approximately 75 photographs of air pollution events were taken during the 84-day Skylab 4 mission. This imagery may be separated into two categories according to the sources of the pollution: natural pollution, which consists of dust generated by wind, naturally induced forest fires, and smoke generated by volcanic activity, and manmade pollution, which includes brush fires, smoke plumes from stacks or open burning, contrails, and

ship trails. Results of the analysis of some of the most interesting photographs are discussed in this section. Photographs of the following are analyzed: the Sakura-zime volcanic activity; dust clouds, the Los Angeles pollution pall; long smoke plums; an African brush fire, an Argentine forest fire, cirrus cloud plumes, and a snow streak.

Avail: NTIS MF A01; SOD HC $16.50 CSCL 04B

The high resolution and image contrast of Skylab 4 photographs reveal details of the cloud structure associated with extratropical storms that normally cannot be seen in routinely available meteoriogical satellite images. A stereopair take over southern Arizona and northwestern Mexico east of the Gulf of California provides a good example of the cirrus clouds associated with a subtropical jet stream and demonstrates the height differences of multilayered clouds. The effects of cold air flowing over the warmer waters of the eastern Great Lakes, New York, southern New England, and the Atlantic Ocean are detailed as well as the cloud structure of an occluded cyclone. MESOSCALE WAKE CLOUDS IN SKYLAB PHOTOGRAPHS
T. Theodore Fujita and Jaime J. Tecson *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 463-478 refs
Avail: NTIS MF A01; SOD HC $16.50 CSCL 04B

Examination of mesoscale cloud patterns within the wakes of obstacles seen in Skylab photographs reveals the existence of specific types of wake clouds. Cumulus streets occur when the lapse rate above the surface is adiabatic with a medium to slow flow rate. Karman vortex streets occur when the lapse rate above the surface is small, zero, or negative, with a slow to medium flow impinging against a relatively large obstacle. Wake waves occur when the lapse rate above the surface is small with a medium to fast flow rate impinging against a relatively small obstacle. When the flow rate exceeds a critical value, the transverse waves tend to disappear, leaving only the diverging waves. These phenomena are illustrated in Skylab photographs of the Aleutian Islands, the Kuril Islands, the Antipodes, South Pacific Islands, and the Bouvet Island in the South Atlantic.

LIMIT ON REMOTE FTIR DETECTION OF TRACE GASES
A. S. Zachor (Atmospheric Radiation Consultants, Inc.), B. Bartschi, and M. Ahmadjian (AFGL) Sep. 1981 7 p refs
(Contract F19628-77-C-0203; AF Proj. 7670)
(AD-A104842; AFGL-TR-81-0272) Avail: NTIS HC A02/MF A01 CSCL 20/6

We studied the capability of a Fourier spectrometer system to remotely detect trace gases in localized clouds, e.g., stationary source effluents. Detection is based on the degree to which the observed IR spectral radiance contrast between the cloud and adjacent background is correlated with a computed reference spectrum. It is shown that trace gases can be reliably detected when spectral features are well below the noise level. The minimum detectable quantities (MDQ's) for various trace gases at one atmosphere total pressure are given. The MDQ's determine the combinations of gas column thickness and gas-background temperature difference that correspond to 95 percent detection probability and one percent false detection probability when an FTS system with modest-size foreoptics views the target through a path equivalent to approximately one air mass. US-Patent-Appl-SN-078612; US-Patent-Class-343-100ME;
US-Patent-Class-343-100PE; US-Patent-Class-343-781P) Avail: US Patent and Trademark Office CSCL 04A

Trace gases in the upper atmosphere can be measured by comparing spectral noise content of limb soundings with the spectral noise content of cold space. An offset Cassegrain antenna system and tiltable input mirror alternately look out at the limb and up at cold space at an elevation angle of about 22. The mirror can also be tilted to look at a black body calibration target. Reflection from the mirror is directed into a radiometer whose head functions as a diplexer to combine the input radiation and a local oscillator (klystron) beam. The radiometer head is comprised of a Fabry-Perot resonator consisting of two Fabry-Perot cavities spaced a number of half wavelengths apart. Incoming radiation received on one side is reflected and rotated 90 deg in polarization by the resonator so that it will be reflected by an input grid into a mixer, while the klystron beam received on the other side is also reflected and rotated 90 deg, but not without passing some energy to be reflected by the input grid into the mixer.

ENVIRONMENTAL DATA FOR SITES IN THE NATIONAL SOLAR DATA NETWORK
Aug. 1981 176 p Prepared for Argonne National Lab.
(Contract DE-AC01-79CS-30027)
(DE82-000071; SOLAR/0010-81/08) Avail: NTIS HC A09/MF A01

Environmental information collected at the sites of the National Solar Data Network is tabulated for each solar site. The sites are grouped into 12 zones, each of which consists of several adjacent states. The insolation table presents the total, diffuse, direct, maximum, and extraterrestrial radiation for the site. It also shows the ratio of total to extraterrestrial radiation. The temperature table gives the average, daytime, nighttime, maximum, minimum, and inlet-water temperature for the site. All of the passive and some active solar sites are equipped with wind sensors which provide information on wind speed and direction. For some sites, a humidity tables provides relative humidity values for day and night. It also gives values for the maximum and minimum humidity for each day. A technical

discussion of the instruments and measurements used to obtain the data is included.

Continuous measurement of CO2 and aerosol scattering at four wavelengths, using a nephelometer, began at the South Pole station. A filter collection system was installed at the Barrow station to make possible the determination of the mass of the carbonaceous aerosols. It is shown that graphic carbon makes up a significant part of the arctic haze, and because of its optical absorptivity, it may cause a significant contribution to the radiative energy budget. At the Mauna Loa Observatory a cooperative measurement program to obscure the chemical composition of aerosols was initiated.

OIL SPILLS: LARGE SCALE MONITORING BY LANDSAT
M. Albuisson, J. M. Monget, and L. Wald *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 171-172 refs Sponsored by Joint Research Center of the European Communities

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Oil pollution at sea using the LANDSAT multispectral scanner channel was detected. The variations of the reflection coefficient between rough sea and the oil spill was measured. The oil spill flattens the sea and reflects in only one direction while the capillary waves of rough sea scatter the light; a fraction of the incident light only reaches the satellite. An underestimate of pollution is expected during winter because of low solar elevation angles. This method is used to inventory pollution by hydrocarbons in the Mediterranean Sea. An estimation from 800 images shows the cumulative area covered by hydrocarbons, spread over the Mediterranean Sea each year, as 175,000 sq km.

THE OPERATIONAL OIL POLLUTION SURVEILLANCE SYSTEM BEING USED IN FRANCE: FORECASTED FUTURE DEVELOPMENTS IN CONSIDERATION OF THE NATO/CCMS REMOTE SENSING PILOT STUDY CONCLUSIONS
J. M. Massin *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 173-180 ref

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

The requirements of an ideal system for detecting, identifying, classifying, mapping, and tracking oil spills are defined. A core package consisting of a human observer, photographic cameras, side-looking airborne radar, infrared/ultraviolet line scanner, and passive television is proposed. The French airborne remote sensing system is shown to satisfy these requirements. Problems with a remote sensing system able to operate under all weather conditions, transmitting specific information in real time which permits the identification of hydrocarbons without having to check in situ, are discussed. Satellite possibilities are estimated.

SENSITIVITY ANALYSIS OF A MESOSCALE MOISTURE MODEL Final Report
James L. Cogan Mar. 1981 53 p refs
(DA Proj. 1L1-61102-B-53A)
(AD-A101528; ERADCOM/ASL-TR-0079) Avail: NTIS HC A04/MF A01 CSCL 04/1

Results from the model were computed for a variety of atmospheres and terrain types. A limited sensitivity analysis showed the effect of different model input parameters on meteorological variables for one vertical column through the atmosphere at a central horizontal grid point. A detailed analysis of selected cases for the entire domain of the model indicated the effect of input parameters on vertical velocity, precipitation amount, and precipitation rate. For one set of input parameters, analyses were performed of the variation of vertical velocity and precipitation every 2 hours for a 12-hour period. An example of a potential application to electro-optical algorithms is discussed and suggestions are made for future work.

(Contract F04701-80-C-0081)

(AD-A105784; TR-0081(6640)-3; SD-TR-81-70) Avail: NTIS HC A03/MF A01 CSCL 08/7

The explosive eruption of Mt. St. Helens on 18 May 1980 was monitored by infrared sensors aboard two U.S. Air Force satellites. Essentially continuous data are available following the initial sighting of the eruption cloud less than one minute after the earthquake which triggered the eruption. Dual monitoring permits triangulation so that both the horizontal and vertical development of the eruption can be determined with good temporal resolution. The sequence of events occurring early in the eruption can therefore be established. Author (GRA)

GEODESY AND CARTOGRAPHY

Includes mapping and topography.

A82-10028 **Digital image technology - MC&G impact.** M. Faintich (U.S. Defense Mapping Agency, Aerospace Center, St. Louis Air Force Station, MO). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 32-43. 9 refs.

The Defense Mapping Agency Aerospace Center has developed a program to exploit digital image technology for the advancement of mapping, charting, and geodesy. Primary studies include image processing, analysis, and display techniques, and computer image generation. State-of-the-art digital image technology concepts have had a dramatic influence on the ability to analyze various digital data bases produced by the Defense Mapping Agency. In addition, emerging technologies in image processing and digital image analysis for automated feature extraction are demonstrating the potential for significant improvement in the utilization of imagery and significant reduction of production costs. Analyses of Landsat images and Viking Mars images are considered as examples. B.J.

A82-10029 **Factorial analysis of terrain feature positioning parameters used in combining radar and digital terrain model data.** R. Brock (New York, State University, Syracuse, NY) and D. I. Zulch (USAF, Rome Air Development Center, Griffiss AFB, NY). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 44-51.

The significance of selected data collection parameters in the combination of radar data and digital terrain model data is evaluated in three phases: (1) the development of deterministic radar models from given digital terrain models and varying radar parameters; (2) the perturbation of the terrain feature coordinates which result from errors in radar position, radar orientation, range, and resolution; and (3) a factorial analysis of the terrain feature errors to establish the significance of the main fixed factors and their interactions; the main factors are azimuth from radar to terrain feature, range, resolution, terrain height, and coordinate. It is found that order of greatest to least importance of the factors is coordinate, range, resolution, terrain height, and azimuth. B.J.

A82-10056 **Application of satellite Doppler techniques to the national mapping program.** F. E. White, Jr. (U.S. Geological Survey, Topographic Div., Denver, CO). In: American Congress on Surveying and Mapping, Annual Meeting, 40th, St. Louis, MO, March 9-14, 1980, ACSM Technical Papers. Falls Church, VA, American Congress on Surveying and Mapping, 1981, p. 406-410.

Operational experience related to an employment of a Doppler system in Alaska during 1978 is discussed. There were certain problems in connection with equipment failure, poor weather conditions, and the destruction of one of the antennas by a grizzly bear. For a continuation of the operations, two MX 1502 Satellite Surveyor Systems were acquired in January 1979. Advantages of these systems over other systems currently in use are briefly examined. A description is presented of a research experiment which had been proposed in order to test and evaluate the acquired type of system at 29 deg, 40 deg, and 48 deg latitude. During the 1979 field season in Alaska, two teams established 45 Doppler stations and 65 electronic traverse stations from north of the Brooks Range area in the Arctic. Attention is given to a new instrument which would transcribe the cassette data of the Doppler Survey System to 9-track magnetic tape. G.R.

A82-10057 **Bureau of Land Management satellite Doppler positioning techniques.** W. E. Ball, Jr. (U.S. Bureau of Land Management, Denver, CO). In: American Congress on Surveying and Mapping, Annual Meeting, 40th, St. Louis, MO, March 9-14, 1980, ACSM Technical Papers. Falls Church, VA, American Congress on Surveying and Mapping, 1981, p. 411-421. 6 refs.

The U.S. Department of the Interior Bureau of Land Management has been using satellite Doppler positioning techniques to supplement existing survey control in Alaska since 1973. Multistation simultaneous positioning techniques are employed to obtain accurate relative positions among stations observed. Computed relative position coordinates are subsequently adjusted to conform to the known coordinates of the primary station, and to assure compatibility between all other satellite observation stations and existing local geodetic control stations. (Author)

A82-10645 * **GPS application to mapping, charting and geodesy.** W. J. Senus (U.S. Defense Mapping Agency, Advanced Technology Div., Washington, DC) and R. W. Hill (U.S. Navy, Naval Surface Weapons Center, Dahlgren, VA). *(Institute of Navigation, National Aerospace Meeting, Warminster, Pa., Apr. 8-10, 1981.) Navigation,* vol. 28, Summer 1981, p. 85-92. 6 refs. Research sponsored by the U.S. Defense Mapping Agency, U.S. Geological Survey, NASA, and NOAA.

GPSPAC, a receiver being developed for space applications by the Defense Mapping Agency and NASA, will use signals from GPS constellations to generate real-time values of host vehicle position and velocity. The GPSPAC has an L-band antenna and preamp capable of receiving the 1575 MHz and 1227 MHz spread spectrum signals; its stable oscillator at 5.115 MHz provides the basic frequency reference, resulting in a long term drift of less than one part in 10 to the -10th day. The GPSPAC performs many functions on board the spacecraft which were previously relegated to large-scale ground-based computer/receiver systems. A positional accuracy of better than 8 can be achieved for those periods when four or more NAVSTAR satellites are visible to the host satellite. The GPS geodetic receiver development, which will provide prototype receivers for utilization in terrestrial surveying operations, has the potential to significantly enhance the accuracy of point geodetic surveys over the current user hardware capability. J.F.

A82-10859 **Digitizing and automated output mapping errors.** L. G. S. Thompson (U.S. Military Academy, West Point, NY). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Oct. 1981, p. 1455-1457.

Computer assisted cartography and mapping have become a reality. However, the errors concerned with these operations are still somewhat uncertain. Under the conditions found at the Army Survey Regiment, Bendigo, Australia, the errors associated with the digitizing of discrete points and the automated output of these points onto contact film were found to be 3.3 m and 1.9 m at ground scale (+ or - 0.082 mm and + or - 0.037 mm at table scale). The frequency of capturing digits and the expected errors when digitizing nondiscrete points (i.e., when the cursor is continuously in motion) are also discussed. (Author)

A82-12186 * **Magnetic field-aligned electron distributions in the dayside cusp.** L. J. Zanetti, T. A. Potemra (Johns Hopkins University, Laurel, MD), J. P. Doering, J. S. Lee (Johns Hopkins University, Baltimore, MD), and R. A. Hoffman (NASA, Goddard Space Flight Center, Greenbelt, MD). *Journal of Geophysical Research,* vol. 86, Oct. 1, 1981, p. 8957-8970. 35 refs. Contract No. NAS5-11415.

Observations of low-energy electron fluxes made over a 6 year period with the photoelectron spectrometer on the AE-C and AE-D satellite are used to investigate electron pitch angles in the low altitude cusp. A 16 point energy spectrum from 2 to 500 eV was obtained at every .25 s, and the location of the cusp was verified by the presence of protons detected by the low-energy electron instrument. Isotropic fluxes of precipitating electrons with Maxwellian energy spectra were observed in the low-altitude cusp, and the presence of low-energy electrons with pitch angles less than 15 deg was determined streaming into the cusp ionosphere. The energies of the streaming electrons sometimes appeared as a peak superimposed on the normal cusp Maxwellian background of isotropic electrons, and it is concluded that the energies and pitch angle distributions of the precipitating electrons may explain the enhancements of auroral emissions and discrete arcs. A82-12215 **Distant magnetic field effects associated with Birkeland currents /made possible by the evaluation of TRIAD's**

attitude oscillations/. G. Gustafsson (Kiruna Geophysical Institute, Kiruna, Sweden), T. A. Potemra, S. Favin (Johns Hopkins University, Laurel, MD), and N. A. Saflekos (Boston College, Chestnut Hill, MA). *Journal of Geophysical Research,* vol. 86, Oct. 1, 1981, p. 9219-9223. 13 refs. NSF Navy-supported research.

Principal oscillations of the TRIAD satellite are studied in 150 passes and are identified as the librations of a gravity-stabilized satellite. The libration periods are T(O)/2 and T(O)/(3) exp 1/2, where T(O) is the orbit period of about 100 min. The amplitude and phase change over periods of a few days, sometimes vanishing altogether, and these attitude changes are numerically evaluated and removed. Data from three consecutive passes spanning over three hours show a magnetic profile which extends as far as 10 deg in latitude from a single region 1 Birkeland current sheet, confirming the permanent and global nature of large-scale Birkeland currents.

An improved method is proposed for computing distortion arising in the calibration of aerial topographic cameras. The new method is especially suitable for implementation on a large computer, and was found to lead to a fivefold-to-sixfold improvement in the computation of distortion as compared with traditional methods.

A82-15032 * **The surface albedo of the earth in the near ultraviolet /330-340 nm/.** J. E. Frederick (NASA, Goddard Space Flight Center, Laboratory for Planetary Atmospheres, Greenbelt, MD) and R. B. Abrams (Computer Sciences Corp., Silver Spring, MD). *Remote Sensing of Environment,* vol. 11, Nov. 1981, p. 337-347. 13 refs.

Satellite-borne measurements of solar radiation backscattered by the earth and atmosphere allow a determination of the surface albedo in the near ultraviolet. The data yielded albedos at tropical latitudes during a 15-month period in 1979-1980. The wavelengths studied are 331.2 and 339.8 nm. Sixty-nine percent of the measurements imply albedos less than 0.3. Higher values include a contribution due to reflection from clouds and are consistent with previous estimates of the fractional cloudover in the tropics. An albedo histogram based on a bin width of 0.1 shows results in the range 0.1-0.2 to be the most frequent, appearing in 29% of the cases, although values which span the entire range 0.0-1.0 are present. The derived albedos show no correlation with solar zenith angle. This result is consistent with the fact that, at the wavelengths considered, the diffuse integrated intensity is larger than the attenuated direct solar beam near the ground.

A82-16868 **Use of hydromagnetic waves to map geomagnetic field lines.** R. A. Greenwald, A. D. M. Walker (Johns Hopkins University, Laurel, MD), and M. Candidi (CNR, Laboratorio per il Plasma nello Spazio, Frascati, Italy). *Journal of Geophysical Research,* vol. 86, Dec. 1, 1981, p. 11251-11257. 12 refs. NSF Grant No. ATM-80-03300.

It is pointed out that if ionospheric and magnetospheric regions showing highly correlated temporal variations could be identified, it would be possible to determine the region in the ionosphere conjugate to a given location in the magnetosphere. A cross-correlation analysis is presented of Pc 5 magnetic field oscillations observed by GEOS 2 with drift velocity oscillations (electric field) observed with the STARE radars in the ionosphere. It is noted that GEOS 2 is in geostationary orbit with its conjugate point nominally located in the STARE field of view. Several comparisons are made over a 1-hour period in the early afternoon sector, and correlation coefficients reaching 0.84 over a limited area in the ionosphere are obtained. It is found that between the beginning and end of the hour, the measured footpoint is displaced by approximately 1 deg in latitude and approximately 2.5 deg in longitude.

A82-18797 # **Space techniques to monitor movements in the earth's crust.** S. Hieber (ESA, Directorate of Application Programmes, Paris, France). *ESA Bulletin,* no. 28, Nov. 1981, p. 62-67.

Space techniques to monitor movements in the earth's crust such as very slow drift of tectonic plates or regional fault motions are discussed. Major research objectives in geodynamics are given. Space techniques include a number of satellite remote sensing missions, very-long-baseline interferometry and laser tracking methods, and satellite gradiometry. It is concluded that satellite imagery can be used in many more ways to enhance interdisciplinary research in geophysics and geology.

DESCRIPTION AND COMPARISON OF ALGORITHMS FOR SOLVING LARGE SETS OF SPARSE MATRIX NORMAL EQUATIONS IN GEODESY AND PHOTOGRAMMETRY Ph.D. Thesis - Technischen Univ., Munich [DARSTELLUNG UND VERGLEICHE VON LOESUNGSSTRATEGIEN FUER GROSSE SCHWACH BESETZTE NORMALGLEICHUNGSSYSTEME IN DER GEODAESIE UND IN DER PHOTOGRAMMETRIE]
Franz Steidler Verlag der Bayerischen Akademie der Wissenschaften 1980 117 p refs In GERMAN
(Ser-C-261; ISSN-0065-5325; ISBN-3-7696-9313-2) Avail: Issuing Activity

Algorithms were investigated in relation to calculation time and data storage capability. For geodetic networks, direct techniques for sparse matrices are very well suited. For photogrammetric bundle-block adjustments with self calibration the conventional use of band algorithms is the best choice. For generating a digital terrain model following the finite element method, the band algorithm solves the normal equations in the fastest way. Author (ESA)

GEOLOGY AND MINERAL RESOURCES

Includes mineral deposits, petroleum deposits, spectral properties of rocks, geological exploration, and lithology.

A82-11039 * **A closer examination of the reduction of satellite magnetometer data for geological studies.** R. D. Regan (Barringer Resources, Golden, CO), D. W. Handschumacher (U.S. Navy, Naval Ocean Research and Development Activity, Bay St. Louis, MS), and M. Sugiura (NASA, Goddard Space Flight Center, Greenbelt, MD). *Journal of Geophysical Research*, vol. 86, Oct. 10, 1981, p. 9567-9573. 19 refs. Contracts No. N00014-79-C-0653; No. NAS5-25882.

Results of a detailed examination of magnetic field residuals obtained from POGO satellite magnetometer data are presented which illustrate some problems which may be encountered in the reduction and analysis of Magsat data. Comparisons of field residuals determined from OGO 2, 4 and 6 data for the region between 270 and 290 deg E reveals significant differences between the satellite data sets which are related to differences in the residual field level on individual satellites, external field contamination and effects from ring current correction in the data reduction process. When a new map is prepared from OGO 2 and 4 satellite data by compensating for these factors, dramatic differences with the original map are noted, including the disappearance of a major positive anomaly and the better definition of various magnetic highs and lows. The new map is also noted to be more consistent with conventional airborne and marine magnetic measurements. The results thus demonstrate the necessity for the inspection of satellite data and the adequate removal of the external field signal prior to geological analysis.
A.L.W.

A82-12366 * # **Coordinates of features on the Galilean satellites.** M. E. Davies and F. Y. Katayama (Rand Corp., Santa Monica, CA). *Journal of Geophysical Research*, vol. 86, Sept. 30, 1981, p. 8635-8657. 13 refs. Contracts No. JPL-953613; No. NASw-3321.

Control nets of the four Galilean satellites have been established photogrammetrically from pictures taken by the two Voyager spacecraft during their flybys of Jupiter in 1979. Coordinates of 504 points on Io, 112 points on Europa, 1547 points on Ganymede, and 439 points on Callisto are listed. Selected points are identified on U.S. Geological Survey maps of the satellites. Measurements of these points were made on 234 pictures of Io, 115 pictures of Europa, 282 pictures of Ganymede, and 200 pictures of Callisto. The systems of longitude were defined by craters on Europa, Ganymede, and Callisto. Preliminary solutions have been found for the directions of the axes of rotation of the Galilean satellites. New mean radii have been determined as 1815 + or - 5 km for Io, 1569 + or - 10 km for Europa, 2631 + or - 10 km for Ganymede, and 2400 + or - 10 km for Callisto.

MORPHOSTRUCTURAL ANALYSES OF SPACE IMAGERY IN THE CENTRAL COLORADO PLATEAU Ph.D. Thesis
Abdelrahman Mohammad Shafik Maarouf 1981 130 p
Avail: Univ. Microfilms Order No. 8118146

Coincidences of increase or decrease in frequency of most of the lineament trends common to both Skylab and Landsat photos and images of the Colorado Plateau suggest that the peaks or troughs are not artificially introduced by sampling bias, and there are actual preferred orientations represented by peak or trough coincidences. Interpretation of lineaments from Skylab and Landsat data, along with study of magnetic and gravity maps, suggest strong correlation between lineaments and faults in the Precambrian basement. It is shown that the basement faults influenced the present surface drainage and structures through a sedimentary cover of more than 6 km. The faults were formed during the middle Precambrian, and were rejuvenated later in varying degrees and at various times. Dissert. Abstr.

REMOTE SENSING STUDIES OF SOME IRONSTONE GRAVELS AND PLINTHITE IN THAILAND Ph.D. Thesis
Pichit Jamnongpipatkul 1980 336 p
Avail: Univ. Microfilms Order No. 8177113

Ironstone gravels and plinthite in eastern Thailand were found to be associated with alluvial terraces as well as shale and basalt formation. Selected stereopairs of airphotos of known areas of ironstone gravels and plinthite were studied. The keys for airphoto interpretation were developed on the basis of the relation with types of landform, vegetation and appearance on the airphotos. Visual analysis of LANDSAT data provided information on the types of LANDSAT and vegetation which could lead to more detailed investigation of probable areas of ironstone gravels and plinthite. Digital analysis of LANDSAT data indicated that the difference of spectral reflectances from areas of ironstone gravels and those from the surrounding areas is considerable. Field study was conducted to verify the results of airphotos interpretation and LANDSAT data analysis and to obtain information in regard to genesis and morphology of soils with ironstone gravels and plinthite. Soil profile descriptions for typical soils with ironstone gravels and plinthite are included.

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08B

The usefulness of manned observations and handheld-camera photographs from space is confirmed by the immediate application of Skylab 4 data to the study of sand seas. The Skylab 4 crew provided information that: (1) confirms a tentative global classification of eolian sand deposits based on observed similarities in most of the major deserts of the world; (2) allows the preparation of maps that show the relationships of sand deposits to each other, to sand source areas, to natural sand distribution barriers, and to human land use; and (3) allows the regional patterns of large-scale dune morphology to be studied in relation to rainfall distribution and surface winds. Four sites in the Sahara and sub-Sahara of northern Africa, four in the Namib and Kalahari Deserts of southern Africa, two in the Empty Quarter of Saudi Arabia, five in the Takla Makan and Gobi Deserts of China, and three in the trans-Caspian deserts of the U.S.S.R. were selected as well as additional areas in northern Africa, India, Mexico, and Australia. SKYLAB 4 OBSERVATIONS OF VOLCANOES. PART A: VOLCANOES AND VOLCANIC LANDFORMS. PART B: SUMMIT ERUPTION OF FERNANDIAN CALDERA, GALAPAGOS ISLANDS, ECUADOR
Jules D. Friedman, Grant Heiken (Low Alamos Scientific Labs., New Mexico), Tom Simkin (Smithsonian Inst., Washington, D.C.), and Arthur F. Krueger (NOAA, Washington, D.C.) *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 137-173 refs
Avail: NTIS MF A01; SOD HC $16.50 CSCL 08K

Terrestrial volcanic features were observed and photographed from Skylab 4 under a variety of viewing conditions and Sun angles. Eruptions of Sakura-zima in southern Kyushu, Japan and the remote Fernandina volcano in the Galapagos Islands provided rare documentation of eruption clouds. Remote volcanic regions were also surveyed including the Tibesti volcanic massif and the Emi Koussi Caldera in Chad; the Altiplano volcanic field of Bolivia, Argentina, and Chile; the Kanchatcha Penninsula, U.S.S.R.; and the southeastern central plateau of Mexico. The landforms of volcanic provinces of Hawaii, southern Italy, the Aleutian Islands, Oregon, and Washington State were also investigated. Previously unobserved relationships between geomorphology and structure and previously unmapped tectonic ligaments were revealed as well as stratigraphic or relative age distinctions between partly overlapping basaltic flows. A.R.H.

THE MANICOUAGAN IMPACT STRUCTURE OBSERVED FROM SKYLAB
M. R. Dence *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 175-190 refs

(Contrib-544) Avail: NTIS MF A01; SOD HC $16.50 CSCL 08B

From comprehensive views of eastern Canada provided by Skylab oblique photographs, the main elements of the multi-ring Manicougan structure can be defined. By gravitational scaling, the structure is an analog for 200 km diameter structures on Mars and Mercury and 400 km to 500 km basins on the Moon. Because much larger structures on the other planets have rings spaced at intervals of 2 to the 1/2 power spacing, it is of interest to know if rings with intermediate spacing can be identified. INFRARED SPECTROSCOPY OF MICROORGANISMS NEAR 3.4 MICRONS IN RELATION TO GEOLOGY AND ASTRONOMY
F. Hoyle, N. C. Wickramasinghe, S. Al-Mufti, and A. H. Olavesen Jun. 1981 11 p refs Submitted for publication
(Preprint-69) Avail: NTIS HC A02/MF A01

Cracking of microorganisms at high temperature and pressure were examined for the existence of microfossils in sedimentary rocks of the Isna series. Microorganism specimens were examined for degradation by infrared spectroscopy over the wavelength range from 2.5 microns to 15 microns. Stability up to 380 C after which there is degradation towards graphite is shown. It is concluded that the preservation of microfossils is feasible in rocks metamorphosized at temperatures of 400 C. (Contract NAS5-26414)
(E82-10009; NASA-CR-164907) Avail: NTIS HC A03/MF A01 CSCL 08G

Progress is reported in developing predictive abilities to evaluate the potential stabilities of magnetic minerals in the Earth crust and mantle by: (1) computing oxidation state profiling as a function of temperature and pressure; (2) compiling data on basalts to establish validity of the oxidation state profiles; (3) determining Fe-Ni alloys in association with magnetitie as a function of temperature and oxidation state; and (4) acquiring large chemical data banks on the mineral ilmenite which decomposes to mineral spinel in the presence of high sulfur or carbonate environments in the lower crust upper mantle. In addition to acquiring these data which are related to constraining Curie isotherm depths, an excellent correlation was found between MAGSAT anomaly data and the geology of West Africa. A.R.H.

In the Powder River Basin, Wyo., narrow geologic units having thermal inertias which contrast with their surroundings can be discriminated in optimal images. A few subtle thermal inertia anomalies coincide with areas of helium leakage believed to be associated with deep oil and gas concentrations. The most important results involved delineation of tectonic framework elements some of which were not previously recognized. Thermal and thermal inertia images also permit mapping of geomorphic textural domains. A thermal lineament appears to reveal a basement discontinuity which involves the Homestake Mine in the Black Hill, a zone of Tertiary igneous activity and facies control in oil producing horizons. Applications of these data to the Cabeza Prieta, Ariz., area illustrate their potential for igneous rock type discrimination. Extension to Yellowstone National Park resulted in the detection of additional structural information but surface hydrothermal features could not be distinguished with any confidence. A thermal inertia mapping algorithm, a fast and accurate image registration technique, and an efficient topographic slope and elevation correction method were developed. Author

Avail: NTIS HC A07/MF A01

Gravity and aeromagnetic surveys revealed details of subsurface structure and lithology. Information caused by volcanic events accommodated along straight line faults combining to give a curvilinear appearance to regional structure is suggested. The magnetic data suggest that rock units may have been altered, perhaps thermally, from their original state. The gravity data indicate that the south part of Timber Mountain is underlain by relatively dense and possibly intrusive rock, like that which crops out along its southeast side. The gravity data also suggest that the Silent Canyon caldera may extend considerably south of its presently indicated southern limit and may underlie much of the area of Timber Mountain. The most areas appear to be more rectangular or triangular than annular in shape. The southern part of Timber Mountain caldera is separated from the Yucca Mountain area to the south by a triangular horst. The structural relations of the rock units making up the horst are complex. Several linear terrain features in the southern part of the caldera area are closely alined with geophysical features, implying that the terrain features are fault controlled. DOE

AN INVESTIGATION INTO THE APPLICABILITY OF THERMAL INFRARED SCANNING FOR EXPLORATION Final Report, Feb. 1981
Heribert Broicher Bonn Bundesministerium fuer Forschung und Technologie Jun. 1981 18 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-81-087; ISSN-0340-7608) Avail: NTIS HC A02/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 3,80

Pratt's theory of thermal inertia stripping lead to thermal inertia calculations for subsurface zones subjected to diurnal and annual temperature variations, as well as to temperatures at the zone limits. Thermal inertia mapping after separating these zones gains in importance for exploration since forebodies might cause detectable subsurface temperature anomalies. T.M.

OCEANOGRAPHY AND MARINE

Includes sea-surface temperature, ocean bottom surveying imagery, drift rates, sea ice and icebergs, sea state, fish location.

A82-10671 **Analysis of SEASAT wind observations over the Indian Ocean.** J. J. Fernandez-Partagas and M. A. Estoque (Miami, University, Miami, FL). *Tellus,* vol. 33, Oct. 1981, p. 463-475. Contract No. NOAA-NA-79SAC00737.

Surface winds as observed by the Seasat-A satellite over the Indian Ocean for the period July 15-17, 1978 are analyzed. The purposes of the analysis are: (1) to evaluate the accuracy of the Seasat wind measurements by comparing these measurements with ship observations and (2) to determine the improvement introduced to the description of the synoptic-scale wind field at the surface by adding Seasat data to ship and island wind observations. The results of the study indicate that: (1) on the synoptic scale, the accuracy of Seasat-derived winds is comparable to that of conventional surface observations and (2) a significant improvement in the surface wind analysis is achieved by incorporating Seasat wind information, especially in data sparse areas. (Author)

A82-11201 **The observation of tidal patterns, currents, and bathymetry with SLAR imagery of the sea.** G. P. De Loor (Centrale Organisatie voor Toegepast-Natuurwetenschappelijk Onderzoek, Physisch Laboratorium TNO, The Hague, Netherlands). *IEEE Journal of Oceanic Engineering,* vol. OE-6, Oct. 1981, p. 124-129. 9 refs.

Work done until 1978 on the visualization of currents, bathymetry, internal waves, etc., in SLAR imagery of the sea is reported. It did not receive much attention until the SEASAT SAR imagery showed these effects on a global scale. Although we know, qualitatively, how these images come about we are yet far from knowing how to extract more quantitative data from them on depth, current speed, etc. Much research effort is still needed here and for this work a simple real-aperture SLAR can be a very useful tool. (Author)

A82-11202 * **SAR imaging of ocean waves - Theory.** A. Jain (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *IEEE Journal of Oceanic Engineering,* vol. OE-6, Oct. 1981, p. 130-139. 26 refs. Contract No. NAS7-100.

A SAR imaging integral for a rough surface is derived. Aspects of distributed target imaging and questions of ocean-wave imaging are considered. A description is presented of the results of analyses which are performed on aircraft and a spacecraft data in order to gain an understanding of the SAR imaging of ocean waves. The analyzed data illustrate the effect of radar resolution on the images of azimuthally traveling waves, the dependence of image distortion on the angle which the waves make with the radar flight path, and the dependence of the focusing parameter of the radar matched filter on the ocean wave period for azimuthally traveling waves. A dependence of ocean-wave modulation on significant wave height is also observed. The observed dependence of the modulations of azimuth waves on radar resolution is in contradiction to the hypothesis that these modulations are caused mainly by velocity bunching. G.R.

A82-11203 **Wave orbital velocity, fade, and SAR response to azimuth waves.** R. K. Raney (Canada Centre for Remote Sensing, Ottawa, Canada). *IEEE Journal of Oceanic Engineering,* vol. OE-6, Oct. 1981, p. 140-146. 18 refs.

Orbital motion of azimuth waves imposes differential Doppler shifts on wave imagery as seen by a SAR. This paper shows that these Doppler shifts are a function only of the wave and sensor geometry, and are not a function of SAR parameters. The azimuth wave reflectivity so modulated is equivalent to a redistributed scatterer density which can be used as an input with the SAR modulation transfer function for general distributed scenes to derive the azimuth wave image. The static scatterer density is calculated for a variety of sea states. Wave accelerations are not of first-order importance. Scatterer fade (decorrelation) is of central importance, as it impacts the SAR transfer function that is effective in wave imaging. (Author)

A82-12885 * **Synoptic thermal and oceanographic parameter distributions in the New York Bight Apex.** R. W. Johnson (NASA, Langley Research Center, Hampton, VA), G. S. Bahn (Kentron International, Inc., Hampton, VA), and J. P. Thomas (NOAA, Northeast Fisheries Center, Highlands, NJ). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Nov. 1981, p. 1593-1598. 11 refs.

Concurrent surface water measurements made from a moving oceanographic research vessel were used to calibrate and interpret remotely sensed data collected over a plume in the New York Bight Apex on 23 June 1977. Multiple regression techniques were used to develop equations to map synoptic distributions of chlorophyll a and total suspended matter in the remotely sensed scene. Thermal (which did not have surface calibration values) and water quality parameter distributions indicated a cold mass of water in the Bight Apex with an overflowing nutrient-rich warm water plume that originated in the Sandy Hook Bay and flowed south near the New Jersey shoreline. Data analysis indicates that remotely sensed data may be particularly useful for studying physical and biological processes in the top several metres of surface water at plume boundaries. (Author)

A82-13214 **Oceanic wind and balanced pressure-height fields derived from satellite measurements.** R. M. Endlich, D. E. Wolf, C. T. Carlson, and J. W. Maresca, Jr. (SRI International, Menlo Park, CA). *Monthly Weather Review,* vol. 109, Sept. 1981, p. 2009-2016. 14 refs. Contract No. NOAA-NA-795AC0073.

The surface wind field over part of the northern Pacific on July 17 and October 3, 1978, was analyzed in light of (1) Seasat-A scatterometer system (SASS) measurements of wind speed and direction, and (2) GOES-2 satellite measurements of cloud motion directions. Agreement was found upon comparison of the surface pressure fields computed from the nondivergent, SASS-derived wind velocity fields using the balance equation with National Meteorological Center surface pressure fields. The linear correlation coefficient between the two fields was 0.91 for July 17 and 0.84 for October 3, indicating that the surface wind and pressure fields of the global oceans, excluding a narrow equatorial zone where the balance equation is invalid, can be determined with good accuracy by the exclusive use of satellite measurements. O.C.

A82-14586 # **Water vapour absorption in the 3.5-4.2 micron atmospheric window.** I. J. Barton (Oxford University, Oxford, England; Commonwealth Scientific and Industrial Research Organization, Div. of Atmospheric Physics, Aspendale, Victoria, Australia). *Royal Meteorological Society, Quarterly Journal,* vol. 107, Oct. 1981, p. 967-972. 16 refs. Research supported by the Natural Environment Research Council.

An analysis of the results of Nimbus 5 Chopper Radiometer data of sea surface water vapor temperature in the 3.5-4.2 micron interval are reported. The interval was chosen because the temperature dependence of the Planck radiance gives better temperature discrimination than at longer wavelengths and the water absorption is smaller, although e-type absorption was observed. Derivation of the absorption coefficients is described, along with measurement techniques used with the Nimbus-5 instruments. A transmittance model was developed to account for absorptances by atmospheric gases, resulting in a value of 4/g sq cm/atm for a self-broadened coefficient at 3.55 microns, implying the possibility of remotely sensing tropical sea surface temperatures to an accuracy of 1 K. M.S.K.

A82-14730 **Radar backscattering from ocean waves at low grazing angles.** H. C. Glaser and T. F. Havig (Boeing Aerospace Co., Seattle, WA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 406-411. 6 refs.

Measurement of backscattering from sea clutter at grazing angles of zero to eight degrees is presented. During the qualification testing of the E-3A maritime radar (S-band, horizontally polarized, short pulse length), sea clutter data were recorded. Almost two billion range gate amplitudes were recorded over the period between

November 1979 and May 1980. Data judged outside the dynamic range of the system and that contaminated by land clutter were deleted. Conditions from flat calm to sea state five with forty knot winds have been recorded. Surface truth was reported by NOAA weather buoys every hour by satellite link. Wind speed was reported by the buoys and by the operator of the target vessel used in the testing. Absolute backscattering levels were determined by comparing the clutter returns with those from a dihedral reflector of measured cross section. Flight-to-flight variation in system gain is less than 2 dB, allowing reliable comparison between all of the data.

A82-15030 **Comparison of polar and geostationary satellite infrared observations of sea surface temperatures in the Gulf of Maine.** R. Legeckis, E. Legg (NOAA, National Environmental Satellite Service, Washington, DC), and R. Limeburner (Woods Hole Oceanographic Institution, Woods Hole, MA). *Remote Sensing of Environment*, vol. 9, June 1980, p. 339-350. 10 refs. Grants No. NOAA-04-7-158-44104; No. NOAA-04-8-M01-149.

A82-15031 * **Remote sensing of benthic microalgal biomass with a tower-mounted multispectral scanner.** D. J. Jobson, S. J. Katzberg (NASA, Langley Research Center, Flight Electronics Div., Hampton, VA), and R. G. Zingmark (South Carolina, University, Columbia, SC). *Remote Sensing of Environment*, vol. 9, June 1980, p. 351-362. 18 refs. Grant No. NsG-1334.

A remote sensing instrument was mounted on a 50-ft tower overlooking North Inlet Estuary, South Carolina in order to conduct a remote sensing study of benthic microalgae. The instrument was programmed to take multispectral imagery data along a 90 deg horizontal frame in six spectral bands ranging from 400-1050 nm and had a ground resolution of about 3 cm. Imagery measurements were encoded in digital form on magnetic tape and were stored, decoded, and manipulated by computer. Correlation coefficients were calculated on imagery data and chlorophyll a concentrations derived from ground truth data. The most significant correlation occurred in the blue spectral band with numerical values ranging from -0.81 to -0.88 for three separate sampling periods. Mean values of chlorophyll a for a larger section of mudflat were estimated using regression equations. The scanner has provided encouraging results and promises to be a useful tool in sampling the biomass of intertidal benthic microalgae.

A82-15076 **Ocean surface height-slope probability density function from SEASAT altimeter echo.** B. J. Lipa (SRI International, Menlo Park, CA) and D. E. Barrick (NOAA, Wave Propagation Laboratory, Boulder, CO). *Journal of Geophysical Research*, vol. 86, Nov. 20, 1981, p. 10921-10930. 25 refs. Grant No. NOAA-MO-A01-78-00-4319.

A82-15213 † **Determination of the length of sea waves by an airborne radar technique (Opredelenie dliny morskikh voln radiolokatsionnym metodom s letatel'nogo apparata).** A. A. Garnaker'ian, V. L. Karakush'ian, and V. D. Bukharin. *Radiotekhnika i Elektronika*, vol. 26, Nov. 1981, p. 2447-2450. 6 refs. In Russian.

A82-15318 * # **An analysis of short pulse and dual frequency radar techniques for measuring ocean wave spectra from satellites.** F. C. Jackson (NASA, Goddard Space Flight Center, Greenbelt, MD). *Radio Science*, vol. 16, Nov.-Dec. 1981, p. 1385-1400. 17 refs.

A four frequency moment characterization of backscatter from the near-vertical is applied to an analysis of the short pulse and dual frequency microwave techniques. The range reflectivity modulation spectrum closely approximates the directional wave slope spectrum, while harmonic distortion is small and is a minimum near 10 deg incidence. The short pulse measurement signal-to-noise ratio (SNR) is typically greater than the narrowband dual frequency SNR, with the difference being the ratio of the range beam extent to pulse length, minus the ratio of beam-limited to pulse-limited Doppler spreads. It is concluded that dual frequency measurements are basically impractical, although short pulse measurements are useful and can employ existing space-qualified microwave hardware.

D.L.G.

A82-15960 † **Investigation of survey conditions for the ocean surface in the 0.4-1.1 micron spectral range (Issledovanie uslovii s'emki poverkhnosti okeana v spektral'nom diapazone 0.4-1.1 mkm).** A. S. Selivanov, Iu. M. Gektin, A. S. Panfilov, and A. B. Fokin. *Issledovanie Zemli iz Kosmosa*, Sept.-Oct. 1981, p. 82-89. 18 refs. In Russian.

The optimal survey conditions were determined for frontal zones, meanders, eddies, and internal waves in the ocean, based on Meteor-satellite observations of the ocean surface in the visible and near-infrared spectral band. A theoretical model is presented, which takes into account these surface phenomena. It is shown that surveys should be performed in the sunny areas, where contrasts reach their maximum values; the maximum values of contrast were observed at solar zenith distances and at angles of sight of about 40 deg. The width of the spectral survey band does not have great significance in the study, since the observed phenomena do not have a marked spectral selectivity. Contrasts on the surfaces were found to disappear when the speed of the ocean surface wind exceeded 5-7 m/sec.

J.F.

A82-15962 † **Development of a coastal relief of the Gulf of Riga, based on results of an analysis of space images (Razvitie rel'efa poberezhii Rizhskogo zaliva po rezul'tatam analiza kosmicheskikh snimkov).** G. A. Saf'ianov and V. I. Kravtsova (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). *Issledovanie Zemli iz Kosmosa*, Sept.-Oct. 1981, p. 97-102. In Russian.

Based on an interpretation of relief forms of the coast of the Gulf of Riga, a geomorphological scheme of the coast was compiled, and an analysis of the dynamics of its development was performed. The direction of the alluvial drift in the past was established, and the main tendency of the dynamic processes of the coastal zone during the past thousand years were determined, namely, the separation of the single flow of deposits due to a change in the external conditions of their displacement.

A82-16341 **U.S. Navy planning for satellite oceanographic data exploitation.** V. E. Noble (U.S. Navy, Naval Research Laboratory, Washington, DC) and R. Y. Felt (U.S. Navy, Naval Oceanography Div., Washington, DC). In: International space technical applications; Proceedings of the Nineteenth Goddard Memorial Symposium, Arlington, VA, March 26, 27, 1981.
San Diego, CA, Univelt, Inc., 1981, p. 117-130. (AAS 81-072)

The authors present an unofficial view of the basis for planning within the Navy Environmental Remote Sensing Program (NERSP). The NERSP includes all phases of research, development, and operational applications related to exploitation of oceanographic data from satellites. The existing 'end-to-end' system will be expanded to provide for: direct and central-site readout, assimilation of satellite data into analysis and prediction programs, dissemination and display of products, and generation of system-specific Tactical Decision Aids. NERSP priorities are driven by requirements, opportunities, and difficulty of R&D problems.

(Author)

A82-16620 † **Images of sea waves obtained in polarimetric surveys (Ob izobrazhenii volneniia pri poliarizatsionnoi s'emke).** V. V. Egorov and B. S. Zhukov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 188-196. 13 refs. In Russian.

An analysis is presented of the influence of the orientation of the analyzer on the structure and contrast of sea-wave images in polarimetric remote-sensing surveys. The imaging process is accompanied by a distinctive wave-filtering which depends on the survey conditions. Experimental results on such polarimetric surveys are presented.

B.J.

A82-17168 **Detection of monsoon inversion by TIROS-N satellite.** M. S. Narayanan and B. M. Rao (Space Applications Centre, Ahmedabad, India). *Nature*, vol. 294, Dec. 10, 1981, p. 546-548. 6 refs.

A link is established between the extent of inversion regions and the convective processes with the Indian monsoon at its different phases. TIROS N satellite data provided sea surface temperature (SST), a 15-layer atmospheric temperature profile from 1000 to 0.4 mbar, and three levels of water vapor content. A horizontal map of the SST and the 1000-850 mb layer-mean temperature with time and spatial averaging, confirmed by comparison with aircraft dropsonde data, revealed the inversion over the Arabian Sea. A 5 x 5 deg grid was devised to account for underlap of the maps, and showed a temperature increase west to east with the growth of a monsoon. A 10 min water vapor curve for tne 700-500 mbar level, drawn from the TIROS data, revealed higher values to the east, with the curve oscillating in weak, active, and revival periods of the monsoon. The middle level moisture changes were consistent with the shifts of low level inversions, and were linked to the monsoon circulation. D.H.K.

A82-17292 * # **Clear water radiances for atmospheric correction of coastal zone color scanner imagery.** H. R. Gordon (Miami, University, Coral Gables, FL) and D. K. Clark (NOAA, National Earth Satellite Service, Washington, DC). *Applied Optics,* vol. 20, Dec. 15, 1981, p. 4175-4180. 18 refs. Contract No. NAS5-22963; Grant No. NOAA-NA-79SA00741.

The possibility of computing the inherent sea surface radiance for regions of clear water from coastal zone color scanner (CZCS) imagery given only a knowledge of the local solar zenith angle is examined. The inherent sea surface radiance is related to the upwelling and downwelling irradiances just beneath the sea surface, and an expression is obtained for a normalized inherent sea surface radiance which is nearly independent of solar zenith angle for low phytoplankton pigment concentrations. An analysis of a data base consisting of vertical profiles of upwelled spectral radiance and pigment concentration, which was used in the development of the CZCS program, confirms the virtual constancy of the normalized inherent sea surface radiance at wavelengths of 520 and 550 nm for cases when the pigment concentration is less than 0.25 mg/cu m. A strategy is then developed for using the normalized inherent sea surface radiance in the atmospheric correction of CZCS imagery. A.L.W.

A82-17492 **The near-infrared radiation received by satellites from clouds.** G. J. Bell and M. C. Wong (Royal Observatory, Hong Kong). *Monthly Weather Review,* vol. 109, Oct. 1981, p. 2158-2163. 12 refs.

An analysis of certain Tiros N IR data of cloud tops and the sea at 3.7 microns which show that the sea is cooler than the clouds is presented. Noting that data taken at 10 microns showed the sea surface to be warmer than the clouds, the total radiation within the satellite's passband reaching the radiometer is defined by the net flux radiated by the element, the flux radiated by the atmospheric molecules and aerosols, and the solar flux reflected by the element. Calculations of the albedo of the clouds and sea show that under certain circumstances the reflected radiance from the sea will yield satellite IR scans which show that the sea is cooler than the clouds, because the sensor is receiving more radiation from the clouds. A steady decrease of albedo occurs with increasing wavelength and angle incidence. M.S.K.

A82-17494 **Annual and nonseasonal variability of monthly low-level wind fields over the Southeastern Tropical Pacific.** . B. Enfield (Oregon State University, Corvallis, OR). *Monthly Weather Review,* vol. 109, Oct. 1981, p. 2177-2190. 20 refs. NSF Grants No. ATM-78-20419; No. OCE-80-24116; Contract No. NOAA-NA-80RAC00003.

A82-17565 **The use of satellite infrared imagery for describing ocean processes in relation to spawning of the northern anchovy /Engraulis mordax/.** R. Lasker, R. M. Laurs (NOAA, Southwest Fisheries Center, La Jolla, CA), and J. Pelaez (California, University, San Diego, CA). *Remote Sensing of Environment,* vol. 11, Dec. 1981, p. 439-453. 10 refs.

Using satellite infrared thermal imagery in conjunction with extensive sampling for anchovy eggs and adults during March and April 1980, it is confirmed that large areas of the coastal ocean off California were avoided by anchovies during the peak of spawning due to entrainment into the California Current of water at a temperature of less than or equal to 14 C that upwelled north of Point Conception. Upwelling began coincident with the onset of winds from the north and proceeded in pulses separated by a few days. Plumes of upwelled water appeared to be advected southward in ladder-like rows by the California Current. A saline warm water pool more than 50 m deep 40 km off Ensenada, Baja California, Mexico also was avoided by anchovies. The appearance of an inshore 16 C refuge and an extensive 220-km warm-water 'wake' associated with Santa Catalina Island also were observed. Each of these oceanographic features was confirmed by ship observations. (Author)

A82-17567 **Variations in upper ocean heat storage determined from satellite data.** J. R. Miller (Rutgers University, New Brunswick, NJ). *Remote Sensing of Environment,* vol. 11, Dec. 1981, p. 473-482. 12 refs.

The development of new microwave sensors to measure oceanic surface parameters from satellites will provide information applicable to studies of variations in upper ocean heat storage. An algorithm was developed to use satellite-derived values of sea-surface temperature and surface wind speeds to predict changes in subsurface heat storage. The algorithm, which is based on a one-dimensional model of the upper ocean, is used to determine the effect of inherent limitations of satellite data, such as discontinuous coverage and errors in the derived fields. Errors in the temperature field become more important as the surface mixed-layer deepens, and accurate specification of the temperature field appears to be more important than accurate specification of the wind field. However, it is important to obtain information about high wind speed events when they occur. The technique, which also provides information on the total heat flux into the ocean between successive satellite passes, could be improved by obtaining information from more than one satellite and from multiple sensors. (Author)

A82-17915 # **The development of the Tiros Global Environmental Satellite System.** A. Schnapf. *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0383.* 11 p.

A table giving the orbital performance of the Tiros satellites is included. It is noted that the infrared data from the Tiros-N/NOAA satellites can be used to produce charts showing the sea-surface temperature over a larger area and with greater frequency than is possible from any other source. Satellite pictures display the extent and character of ice fields in the Arctic and Antarctic seas and on the Great Lakes with a frequency and geographic coverage never before attained. Tiros also collects and locates data from fixed or moving platforms and monitors electron and proton particles emanating from the sun. C.R.

A82-18074 # **Measurement of sea and ice backscatter reflectivity using an OTH radar system.** W. F. Ring and G. S. Sales (USAF, Rome Air Development Center, Bedford, MA). In: Symposium on the Effect of the Ionosphere on Radiowave Systems, Washington, DC, April 14-16, 1981, Preprints. Washington, DC, U.S. Naval Research Laboratory, 1981. (3B-2). 9 p. 8 refs.

Backscattered radio wave characteristics may permit the recognition of coastal regions or islands through differences in scattering by land and water. This technique is developed for the quantification of sea water, sea ice and Greenland ice cap surface reflectivities so that they may serve as references for the calibration of HF, Over-the-Horizon (OTH) radar sensitivity. Such references are necessary when no aircraft targets-of-opportunity are available to serve as calibration sources. Attention is drawn to the azimuthal or latitudinal variation in radar scattering cross section found. Previous measurements and models do not show the consistent increase in absorption from 65 to 72 deg geomagnetic latitude exhibited by the data presented. An ionospheric absorption or scattering loss mechanism is postulated as an explanation of this phenomenon. O.C.

A82-18716 * **Evaluation of the Seasat wind scatterometer.** W. L. Jones, E. M. Bracalente, L. C. Schroeder (NASA, Langley Research Center, Hampton, VA), D. H. Boggs, D. Shelton (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA), R. A. Brown (Washington, University, Seattle, WA), and T. H. Guymer (Institute of Oceanographic Sciences, Wormley, Surrey, England). *Nature,* vol. 294, Dec. 24-31, 1981, p. 704-707. 16 refs.

Surface wind velocities have been derived from backscatter measurements of the ocean surface made by a satellite-borne, microwave sensor. Comparisons with high-quality surface-based measurements obtained during the Joint Air-Sea Interaction experiment are described. The accuracy of the scatterometer winds at this mid-latitude site, + or - 1.6 m/s in speed and + or - 18 deg in direction, for winds between 3 and 16 m/s is within the design specification. (Author)

A82-18724 * **Anomalous wind estimates from the Seasat scatterometer.** T. H. Guymer (Institute of Oceanographic Sciences, Wormley, Surrey, England), J. A. Businger (Washington, University, Seattle, WA), W. L. Jones (NASA, Langley Research Center, Hampton, VA), and R. H. Stewart (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *Nature,* vol. 294, Dec. 24-31, 1981, p. 735-737. 10 refs.

The Seasat-A Satellite Scatterometer (SASS) measured the radar backscatter intensity from the sea surface using a four-beam microwave antenna. Estimates of wind speed and direction derived from these data agree well with surface measurements made during the Joint Air-Sea Interaction experiment, but there are occasions (3 out of 23 satellite passes) when the results are anomalous. One such occasion when the satellite measurements differed substantially from those at the surface of the sea has been studied, and it has been concluded that the interpretation of the SASS measurements may have been vitiated by a mid-level convective system deep enough to produce thunderstorms and lightning. Avail: NTIS HC A99/MF A01 CSCL 08I

Neil Brown instrument System (NBIS) CTD/02 measurements recorded on five cruises are summarized. A description of the acquisition and processing systems and calibration techniques are presented. These data were collected along longitudes of 105 W and 110 W between 15 N and 5 S. Additional casts in the vicinity of 0 degrees, 153 W also presented. Station locations, meteorological conditions, and profiles of temperature, salinity, sigma T, and oxygen are shown for each cast. GRA

SEASAT ALTIMETRY ADJUSTMENT MODEL INCLUDING TIDAL AND OTHER SEA SURFACE EFFECTS
Georges Blaha Hanscom AFB, Mass. AFGL Mar. 1981 113 p refs
(Contract F19628-78-C-0013; AF Proj. 2309)
(AD-A104188; SR-3; AFGL-TR-81-0152) Avail: NTIS HC A06/MF A01 CSCL 22/2

This study is a part of the on-going effort aimed at improved determinations of the Earth's gravity field through the adjustment of satellite altimeter data in the short-arc mode. Until recently the key role in such adjustments has been played by GEOS-3 altimeter data. However, Seasat altimetry is envisioned as providing a more accurate means for addressing this task. In view of the improved quality of altimeter data and of the corresponding more stringent requirements for the data reduction, several improvements in the existing altimetry model have been designed and are described herein. For example, the criteria have been established specifying the maximum and the mimimum allowable lengths of Seasat arcs. An important improvement in the economy has been achieved through a reduction in the number of spherical-harmonic potential coefficients entering the orbital integrator, without a noticeable compromise in the excellent quality of the Seasat observational system. STUDY ON SATELLITE RADAR ALTIMETRY IN CLIMATOLOGICAL AND OCEANOGRAPHIC RESEARCH, VOLUME 1 Final Report
Paris ESA Dec. 1980 450 p refs Prepared in cooperation with Natural Environment Research Council, Godalming, England 2 Vol.
(Contract ESA-4355/80/F-FC(SC))
(SP/153/06/01/FR(80)-Vol-1; ESA-CR(P)-1437-Vol-1) Avail: NTIS HC A19/MF A01

The contribution of satellite radar altimetry to climate, oceanographic and glaciological research is analyzed. The current position, the need for improved data and the relevance of existing altimeter data to climate, oceanographic and glaciological studies are discussed. Experience gained from previous missions is reviewed and the corrections which need to be made to the basic altimeter data are considered, along with the requirements for supporting measurements needed to aid in interpretation of this data. Sampling requirements in relation to particular aspects of oceanography and glaciology are treated. The role of circulation models in satellite altimetry, and those features of instrument design relating to scientific requirements, are examined. Supporting and complementary instruments are reviewed. The value of multi-satellite missions and possible future developments are discussed. Author (ESA)

A GLOBAL ATLAS OF GEOS-3 SIGNIFICANT WAVEHEIGHT AND COMPARISON OF THE DATA WITH NATIONAL BUOY DATA Ph.D. Thesis
James Douglas McMillan 1981 147 p
Avail: Univ. Microfilms Order No. 8119337

The GEOS-3 significant waveheight estimation algorithm is derived by analyzing the return waveform characteristics of the altimeter. It is shown that the difference between the waveform expected from a flat surface and the actual waveform observed returning from a nonflat sea surface can be analyzed to determine the magnitude of the significant waveheight. This technique employs a curve fitting procedure utilizing least squares estimation. The rationale for a smoothing technique is presented and the convergence characteristics of the smoothed estimate are discussed. Then, a statistically representative sampling of GEOS-3 data is selected for comparison with buoy measurements and the accuracy of the GEOS-3 significant waveheight estimates is deduced, through statistical analysis, to be 50 cm. The GEOS-3 significant waveheight estimates gathered during the entire mission of the spacecraft are assembled in the form of a global atlas of contour maps. Both high and low sea state contour maps are presented, and the data are displayed both by seasons and for the entire duration of the GEOS-3 mission. The contour maps are then compared with contour maps compiled by the U.S. Navy and significant differences are found. Dissert. Abstr.

ANALYSIS OF TESTBED AIRBORNE MULTISPECTRAL SCANNER DATA FROM SUPERFLUX II

David E. Bowker, Charles A. Hardesty, Daniel J. Jobson, and Gilbert S. Bahn (Kentron International, Inc.) *In its* Chesapeake Bay Plume Study Oct. 1981 p 323-338

Avail: NTIS HC A22/MF A01 CSCL 08C

A test bed aircraft multispectral scanner (TBAMS) was flown during the James Shelf, Plume Scan, and Chesapeake Bay missions as part of the Superflux 2 experiment. Excellent correlations were obtained between water sample measurements of chlorophyll and sediment and TBAMS radiance data. The three-band algorithms used were insensitive to aircraft altitude and varying atmospheric conditions. This was particularly fortunate due to the hazy conditions during most of the experiments. A contour map of sediment, and also chlorophyll, was derived for the Chesapeake Bay plume along the southern Virginia-Carolina coastline. A sediment maximum occurs about 5 nautical miles off the Virginia Beach coast with a chlorophyll maximum slightly shoreward of this. During the James Shelf mission, a thermal anomaly (or front) was encountered about 50 miles from the coast. There was a minor variation in chlorophyll and sediment across the boundary. During the Chesapeake Bay mission, the Sun elevation increased from 50 degrees to over 70 degrees, interfering with the generation of data products. M.G.

APPLICATION OF THE NASA AIRBORNE OCEANOGRAPHIC LIDAR TO THE MAPPING OF CHLOROPHYLL AND OTHER ORGANIC PIGMENTS

F. E. Hoge and R. N. Swift (EG&G Washington Analytical Services Center, Inc.) *In* NASA. Langley Research Center Chesapeake Bay Plume Study Oct. 1981 p 349-374 refs

Avail: NTIS HC A22/MF A01 CSCL 08C

Laser fluorosensing techniques used for the airborne measurement of chlorophyll a and other naturally occurring waterborne pigments are reviewed. Previous experiments demonstrating the utility of the airborne oceanographic lidar (AOL) for assessment of various marine parameters are briefly discussed. The configuration of the AOL during the NOAA/NASA Superflux experiments is described. The participation of the AOL in these experiments is presented and the preliminary results are discussed. The importance of multispectral receiving capability in a laser fluorosensing system for providing reproducible measurements over wide areas having spatial variations in water column transmittance properties is addressed. This capability minimizes the number of truthing points required and is usable even in shallow estuarine areas where resuspension of bottom sediment is common. Finally, problems encountered on the Superflux missions and the resulting limitations on the AOL data sets are addressed and feasible solutions to these problems are provided. M.G.

ASSESSMENT OF SUPERFLUX RELATIVE TO REMOTE SENSING
Janet W. Campbell *In its* Chesapeake Bay Plume Study Oct. 1981 p 501-502
Avail: NTIS HC A22/MF A01 CSCL 08C

The state-of-the-art advancements in remote sensor technology due to the Superflux program are examined. Three major individual sensor technologies benefitted from the program: laser fluorosensors, optical-range scanners, and passive microwave sensors. Under Superflux, convincing evidence was obtained that the airborne oceanographic lidar fluorosensor can map chlorophyll, i.e., is linear, over a wide range from less than 0.5 to 5.0 mg/cu m. The lidar oceanographic probe dual-excitation concept for addressing phytoplankton color group composition was also demonstrated convincingly. Algorithm development, real time capabilities, and multisensor integration are also addressed. M.G.

AN ASSESSMENT OF THE POTENTIAL CONTRIBUTIONS TO OCEANOGRAPHY FROM SKYLAB VISUAL OBSERVATIONS AND HANDHELD-CAMERA PHOTOGRAPHS
George A. Maul and Michael McCaslin *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 339-352

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08J

The possible roles that space observes may play in oceanographic experimentation are considered in a discussion of several ocean photographs and visual observations made during the Skylab 4 mission. While hand-held camera photography has a distinct role in reconnaissance, it cannot surpass the quantitativeness of a multispectral observation from a known altitude. Significantly, many of the most interesting scenes were taken by the S190B camera, which produced very high resolution photographs taken from a vertical position. From the standpoint of long term oceanographic observation, quantitative observations are needed with accurate geographical positioning. Concurrent ocean surface observations are also needed to correlate the data. A.R.H.

BOUNDARY DETECTION CRITERIA FOR SATELLITE ALTIMETERS

C. F. Martin and R. L. Taylor Nov. 1981 61 p refs
(Contract NAS6-3075)
(NASA-CR-156880) Avail: NTIS HC A04/MF A01 CSCL 14B

A procedure for using satellite altimeter data to determine the time of crossing of a surface boundary, such as ocean land or ocean ice, with the primary objective to flag altimeter data that do not properly represent oceanographic measurements were studied. Water to land crossing and water to sea ice crossing were investigated. For ocean ice crossings, a large increase in AGC occurred. Waveform tests for increasing the probability of detecting an ocean land crossing were investigated. It is recommended that the boundary test be based on a fit of the full waveform to a limited parameter set at a rate of 5 to 10 second. E.A.K.

SURFACE SIGNS OF INTERNAL OCEAN DYNAMICS
Erik Mollo-Christensen 1980 8 p refs
(Contract N00014-80-C-0273)
(AD-A101380) Avail: NTIS HC A02/MF A01 CSCL 08/3

There are various processes internal to the ocean that can interact with the surface. The resulting interaction causes changes in the surface wave structure that may well be recognizable by remote sensing systems. Vertical motion occurs when a wind driven surface Ekman layer is set up. Such 'pumping' can also take place in deeper Ekman layers especially over sloping bottom surfaces. Internal waves, topographic waves, and current shear can also cause changes in the surface wave field. A combination of ship, buoy, and remote sensors like those aboard LANDSAT and Seasat, coupled with the output of modeling analyses, can immeasurably improve our knowledge of ocean dynamics. Author

SPECTRAL ATMOSPHERIC OBSERVATIONS AT NANTUCKET ISLAND, MAY 7-14, 1981
T. A. Talay and L. R. Poole Nov. 1981 56 p refs
(NASA-TM-83196) Avail: NTIS HC A04/MF A01 CSCL 04A

An experiment was conducted by the National Langley Research Center to measure atmospheric optical conditions using a 10-channel solar spectral photometer system. This experiment was part of a larger series of multidisciplinary experiments performed in the area of Nantucket Shoals aimed at studying the dynamics of phytoplankton production processes. Analysis of the collected atmospheric data yield total and aerosol optical depths, transmittances, normalized sky radiance distributions, and total and sky irradiances. Results of this analysis may aid in atmospheric corrections of remote sensor data obtained by several sensors overflying the Nantucket Shoals area. Recommendations are presented concerning future experiments using the described solar photometer system and calibration and operational deficiencies uncovered during the experiment. A.R.H.

APPLICATION OF REMOTE SENSING DATA ON THE CONTINENTAL SHELF: PROCEEDINGS OF AN EARSeL-ESA SYMPOSIUM
N. Longdon, comp. and G. Levy, comp. Jul. 1981 298 p refs Symp. held in Voss, Norway, 19-20 May 1981 Prepared in cooperation with Royal Norwegian Council for Scientific and Industrial Research, Kjeller
(ESA-SP-167; ISSN-0379-6566) Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

A symposium which studied the application of remote sensing techniques to oceanography, fishing, pollution monitoring, and coastal zone management is reported. National programs, operational requirements, and state of the art are reviewed. The use of satellites, including LANDSAT, Seasat and ERS is highlighted.

N82-14554# European Space Agency, Paris (France). Directorate of Application Programmes.
ERS-1: MISSION OBJECTIVES AND SYSTEM CONCEPT
G. Duchossois and D. Lannertz *In its* Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 5-16

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

The objectives of the first ESA remote sensing (ERS-1) satellite program are the development and promotion of commercial applications related to a better knowledge of ocean parameters; monitoring of sea ice and icebergs for industrial oceanic activities at high latitudes; and to increase understanding of coastal zones and global ocean processes which, together with the monitoring of the polar regions, can provide a major contribution to the World Climate Research Program. The ERS-1 system (space segment and ground segment) is described including the instruments which are part of the Earth applications payload, active microwave instrumentation, an ocean color monitor, and a radar altimeter. The procedures used in selecting the Earth sciences payload complement, the parameters which can be obtained from the applications payload, and a development plan for the ERS-1 system are outlined. THE POTENTIAL AND REQUIREMENTS FOR SPACE OCEANOGRAPHY
Ross N. Williams *In* ESA Appl. of Rumote Sensing Data on the Continental Shelf Jul. 1981 p 23-27 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

The use of satellite systems for communications, navigation, weather, oceanographic, and military purposes is reviewed. The trend is towards automated measurement, analysis, forecast and display of environmental effects. Both Marisat and Fleetsatcom, the shore based naval environmental data network and the commercial satellite data distribution system solve display and dissemination problems; and large dedicated computer capacity and atmospheric prediction models solve analysis and prediction software problems. Meteorological satellite programs together with more traditional atmospheric and oceanographic data imputs is used to demonstrate that globally sensed oceanographic data to initialize the models is not yet fully available, but could be determined with improved accuracy and resolution by employing an ocean satellite system, such as NOSS. OFFSHORE PETROLEUM INDUSTRY ENVIRONMENTAL DATA REQUIREMENTS: EMPHASIS ON REMOTE SENSING

Ronald L. Gratz *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 31-43 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Data quality and coverage requirements for the remote sensing of oceanographic and meteorological factors affecting the development of offshore hydrocarbon resources are considered, using a combination of fine-grid hindcasting and surface truth measurements. The establishment of data banks able to accumulate 20-30 years of climatological data for use in future designs is recommended. Special measurement programs are planned for data collection during storms. Remote sensing was used to measure several factors important to the petroleum industry, i.e., waves, winds, currents, and sea ice. Application to weather forecasting is shown. The use of surface truth data in the calibration and verification of measurements for remote sensing is suggested. Possible communications channels for the exchange of remote sensing data are assessed. Author (ESA)

REQUIREMENTS IN POLLUTION MONITORING AND COASTAL MANAGEMENT

J. Constans (Fondation Cousteau, Monaco) and G. Leger *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 45-46

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Results of tests during a survey of Mediterranean coasts by the research vessel Calypso show general chemical pollution to be too low to justify the rapid decrease in fish, seaweed, and phanerogam populations. However, mechanical and/or physical attacks on the environment, such as land filling and associated constructions, or massive discharges of warm effluents have a devastating impact on coastal ecosystems. Development decision are based on individual/local perspectives. An approach, based on clear, overall, long-term strategies is called for before irreversible damage is done. Optimum use should be made of existing data aquisition techniques, such as ESA and Telespazio satellite imagery. Author (ESA)

FISHERIES INVESTIGATIONS AND MANAGEMENT BENEFITS FROM REMOTE SENSING

R. Ljoeen *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 47-54 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Physical and biological research in areas of particular interest to Norwegian fisheries is described and present problems connected with the management of cod, haddock and mackerel are indicated. Echo sounding techniques are used and salinity and water temperature at different depths are noted. The significance of ice edge dynamics, ocean fronts, and vertical stratification to biological conditions and fish distribution is surveyed. The application of remote sensing is primarily valued as a tool for providing real time physical data in order to optimize biological sampling programs and for indicating drift and variable distributions of eggs and young fish. The utility of IR and visible images from polar orbiting satellites for monitoring purposes is briefly considered. Author (ESA)

THE SEASAT COMMERCIAL DEMONSTRATION PROGRAM

S. W. McCandless (User Systems Engineering, Annandale, Va.), B. P. Miller (Econ, Inc., Princeton, N.J.), and D. R. Montgomery *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul 1981 p 59-72 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

The background and development of the Seasat commercial demonstration program are reviewed and the Seasat spacecraft and its sensors (altimeter, wind field scatterometer, synthetic aperture radar, and scanning multichannel microwave radiometer) are described. The satellite data distribution system allows for selected sets of data, reformatted or tailored to specific needs and geographical regions, to be available to commercial users. Products include sea level and upper atmospheric pressure, sea surface temperature, marine winds, significant wave heights, primary wave direction and period, and spectral wave data. The results of a set of retrospective case studies performed for the commercial demonstration program are described. These are in areas of application such as marine weather and ocean condition forecasting, offshore resource exploration and development, commercial fishing, and marine transportation. Author (ESA)

THE COLOR OF THE SEA AND ITS RELATION TO SURFACE CHLOROPHYLL AND DEPTH OF THE EUPHOTIC ZONE

N. K. Hoejerslev *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 73-76 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Algorithms based on signal ratios from the available channels in Nimbus 7, for the estimation of chlorophyll and phaeophytin are found to be inadequate. This is shown for coastal waters where the concentration of yellow substance (dissolved organic matter) which masks the chlorophyll signal can be variable by orders of more than 10. However, a single globally valid algorithm, based on two wavelengths in the blue and green parts of the spectrum, gives a good estimation of the depth of the euphotic zone as well as for intermediate quanta percentage levels. It is suggested that a relationship be sought involving the depth of the euphotic zone and plankton pigments, standing stock, and primary productivity. Author (ESA)

AN EVALUATION OF SEASAT-A DATA IN RELATION TO OPTIMUM TRACK SHIP WEATHER ROUTING AND SITE SPECIFIC FORECASTING FOR THE OFFSHORE OIL INDUSTRY

C. Daley, R. G. Johnson, and J. C. Thomson *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 93-102 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

The usefulness of Seasat-A SASS and altimeter measurements is reviewed. Five oceanic areas were selected: the Gulf of Alaska, central and western north Atlantic, eastern north Pacific, southern Indian Ocean, and the North Sea. Both Seasat-aided and conventional analyses were used in offshore hindcast and optimum ship routing situations. Where conventional observations are relatively dense, Seasat wind and wave data have greater impact in determining the shape of major map features than in positioning the features. In data sparse areas, Seasat data permit greater definition of surface features as well as their precise location. The use of Seasat data in optimum ship routing is quantified by means of comparative studies in the Gulf of Alaska. Author (ESA)

DETERMINATION OF SURFACE WIND SPEED FROM REMOTELY MEASURED WHITECAP COVERAGE, A FEASIBILITY ASSESSMENT

E. C. Monahan, I. G. Muircheartaigh, and M. P. Fitzgerald *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 103-109 refs

(Grant N00014-78-G-0052)
Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

The relationship between wind speed and oceanic whitecap coverage was determined to facilitate the development of an algorithm for the remote determination of low elevation wind speed from the teledetected enhancement of sea surface microwave brightness temperature due to the presence of whitecaps. A basis is provided for estimating (and correcting for) the contribution to radiance, coming from whitecaps, in the various visible bands measured by satellite instruments. Combining results of the JASIN experiment with earlier observations, the effect of variations in air and sea surface temperature on this relationship is investigated. The wind speed at which whitecaps appear, and thus the lowest wind speed susceptible to teledetection via whiecap signature, is reassessed. Author (ESA)

J. Campbell (Geological Survey, Tacoma, Wash.), J. Crawford, R. Harrington, L. Jones et al *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 113-118 refs Sponsored in cooperation with NASA Bergen Univ., and Royal Norwegian Council for Scientific and Industrial Research

(Grants N00014-80-G-0003; NATO-9-4-02-SRG.19)
Avail: NTIS HC A13/MF A01; ESA, Paris FF 125 CSCL 17I

Passive and active microwave measurements from surface based, airborne, and satellite instruments were obtained together with surface observations northwest of Svalbard. Emissivities of different ice patches in the ice edge region over the spectral range from 4.9 to 94 GHz are presented. The combination of a 6.6 GHz microwave radiometer with a 14.6 GHz scatterometer demonstrates the usefulness of an active/passive system in ice classification. A variety of mesoscale features under different meteorological conditions is revealed by a 1.36 GHz synthetic aperture radar. Ice edge location by Nimbus 7 scanning multifrequency microwave radiometer is shown accurate to 10 km when the 37 GHz horizontal polarized channel is used. Author (ESA)

A SHORT REVIEW OF AN OCEANOGRAPHIC USE OF METEOSAT DATA BY THE ORSTOM REMOTE SENSING SERVICE

J. Citeau and F. Domain (Centre Oceanologique de Bretagne, France) *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 145-156 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Using the thermal infrared band, migration of schools of fish along coasts of Mauritania and Senegal was determined according to the latidudinal position of a thermal front and equatorial upwelling in the Gulf of Guinea was detected. For the latter study, an oceanographic program was instigated to furnish sea truth data. Despite a high degree of cloud cover, the Meteosat data shows good agreement on sea surface temperature. The beginning and development of the equatorial upwelling are adequately followed. The zonal extension of a large warm water band confirms that this upwelling is a phenomenon related to the equatorial process and that no advection from southern latitudes appears on the surface. COASTAL ZONE RESEARCH USING REMOTE SENSING TECHNIQUES

A. P. Cracknell and S. M. Singh *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 157-168 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

For the prelaunch exercise in connection with the EURASEP project, sea truth data was analyzed with data collected simultaneously from LANDSAT. Maps of chlorophyll and suspended sediment distributions over a substantial area of the North Sea off the Belgian and Dutch coastlines were generated. Analysis results of simultaneous airborne ocean color scanner data are compared. The NIMBUS 7 coastal zone color scanner (CZCS) in flight calibration data are compared with preflight calibration constants. Atmospheric corrections are applied. A satisfactory set of procedures for calibrating CZCS data, correlating that data with sea truth measurements, were established. Author (ESA)

N82-14574# Centre d'Etudes Techniques de l'Equipment, Aix-en-Provence (France).

OPERATIONAL USE OF REMOTE SENSING FOR COASTAL ZONE MANAGEMENT AND POSSIBLE CONTRIBUTION OF SPECIALIZED SATELLITES

C. Valerio *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 183-188

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

A multispectral remote sensing system, based on aerial photography, was developed in order to satisfy the requirements of coastal zone management. Data requirements (hydrodynamics, nature of the sea bottom, shore and land use) are interpreted in remote sensing terms. Technoeconomic results for study of the sewage treatment in Antibes on the Mediterranean coast are taken as a remote sensing example. Surface currents were investigated under different wind and climatic conditions. Vertical temperature and salinity profiles show vertical thermal stratification of the sea in that area. Author (ESA)

N82-14576# Swedish Meteorological and Hydrological Inst., Norkoeping.

MARINE ACTIVITIES IN SWEDEN FOR WHICH REMOTE SENSING DATA MAY BE OF INTEREST

Thomas Thompson *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 195-196

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Coastal and offshore activities (physical oceanography, marine meteorology, fishing, marine transportation, environmental protection, and climatology) for which satellite data, particularly microwave measurements available on an operational basis is useful, were reviewed. These involve weather analyses and forecasting, ship routing, ice accretion measurement, sea ice surveillance, sea surface temperature measurement, wave analyses and forecasts, pollution surveillance, sea water level measurement, and surface currents monitoring. Present data has many deficiencies which can be remedied by remote sensing techniques, but a fully operational system is required. Author (ESA)

THE FEASIBILITY OF USING REMOTELY SENSED COLOR AS AN INDEX OF IRISH COASTAL WATER PROPERTIES
E C Monahan, I G OMuircheartaigh, and M P Fitzgerald *In* ESA Appl of Remote Sensing Data on the Continental Shelf Jul 1981 p 233-237 refs

Avail NTIS HC A13/MF A01; ESA, Paris FF 125

Sea truth data collected at 250 oceanographic stations in coastal waters south and west of Ireland are used with statistical methodologies (including least squares fitting and the approach of Box and Cox) to obtain, where feasible, expressions for the relationships between water color and other surface water properties. Close correlation is found between surface salinity, Gelbstoff concentration and water color as expressed by Munsell hue. For the same waters, poor correlation is found between surface chlorophyll-a and water color. Such satellite instruments as the coastal zone color scanner are applicable to the delineation of coastal and offshore water boundaries near Ireland, but are not appropriate for estimating the standing crop of phytoplankton. NECESSITY OF REMOTE SENSING FOR OCEAN STUDIES. PART 1: NORTHWEST AFRICAN MISSIONS, SAHARA-1 AND ATLOR-1
A. Ballester Nolla and C. Romeu Nedwed *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 239-241 refs
Avail. NTIS HC A13/MF A01; ESA, Paris FF 125

Results of two oceanographic missions studying the general conditions of the northwest African offshore upwelling are summarized. Strong correlation between temperature, nutrients (nitrate, phosphate, and silicate) and chlorophyll is found. The upwelling area, 60 to 100 miles offshore, does not correspond to normally accepted mechanisms. Preliminary results suggest a collision between intermediate subequatorial water masses and the southward surface Canary current. The hypothesis is supported by tests comparing sea truth data with remotely sensed temperature data (NOAA 2 VHRR). The employment of remotely sensed data as a formal method of study, and not simply as a complementary aid, is discussed. Author (ESA)

MARITIME APPLICATIONS OF IMAGE PROCESSING AT DFVLR, OBERPFAFFENHOFEN, WEST GERMANY
Klaus A. Ulbricht *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 255-261 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

A digital interactive image analysis system is described and plans for a larger system are summarized. Examples of digital image processing of LANDSAT multispectral scanner images, showing contents otherwise easily missed, are given. Zones of different reflectivity, representing currents or drifts, are pointed out. The LANDSAT pictures of the Baltic Sea from four multispectral channels, processed to display the mass appearance of blue green algae, are included. Phytoplankton development in nearshore and inshore waters of the southwest Baltic, and its drift to deeper areas, are followed. Complexes of banks and channels revealed by LANDSAT in the Tay river and its delta in northeast Scotland are compared with current charts and maps of sediments. Author (ESA)

MEASUREMENTS OF RADAR BACKSCATTER FROM ARCTIC SEA ICE IN THE SUMMER
R. G. Onstott, S. Gogineni, C. V. Delker, and R. K. Moore Jul. 1981 16 p
(Contract N00014-76-C-1105)
(AD-A105586; CRINC/RSL-TR-331-20) Avail: NTIS HC A02/MF A01 CSCL 17/9

Measurements of radar backscatter from sea ice located near Svalbarb and Greenland were made during the summer of 1980 as part of Project YMER. These data were acquired using the University of Kansas helicopter-borne microwave active spectrometer (HELOSCAT II) which operated over a frequency range of 8 to 18 GHz and an angle of incidence range of 0 degrees to 50 degrees. The presence of meltponds, the transformation of the snowpack into an ice layer, and the warmer temperatures have contributed to radar signatures that may be significantly different than those observed during the winter and spring. A wide variety of ice conditions were investigated. These included multiyear, thick first-year, thin first-year, young, new, and pressure-ridged ice. The measurement program is described herein. PROJECT NOORDWIJK. PART 1: MEASUREMENTS OF THE RADAR BACKSCATTER COEFFICIENT GAMMA (SIGMA DEG) IN 1977 AND 1978
G. P. deLoor Nov. 1979 42 p refs 2 Vol.
(PHL-1979-49-Pt-1; TDCK-73426) Avail: NTIS HC A03/MF A01

Radar backscatter measurements obtained from a sea platform are compared with airborne and spaceborne observations. A short range FM radar was mounted beside a television camera and directed into the prevailing winds. Upwind and crosswind data were collected, but downwind data are scarce, and more windspeed data are required. A systematic difference is observed between airborne and ground based data. The value of gamma is dependent on windspeed; dependency differs for the specular region (low incidence angles) and the diffuse (incidence angles > 45 deg). Author (ESA)

N82-14618# Physics Lab. RVO-TNO, The Hague (Netherlands). Research Group 4: Microwaves.

PROJECT NOORDWIJK. PART 2: RESULTS OF NORTH SEA CLUTTER MEASUREMENTS IN THE I-BAND PERFORMED FROM THE PLATFORM NOORDWIJK IN SEPTEMBER/OCTOBER 1977

H. Sittrop and H. Gravesteijn Aug. 1980 79 p refs 2 Vol. (PHL-1980-28-Pt-2; TDCK-74302) Avail: NTIS HC A05/MF A01

Radar backscatter off the sea at low incidence angles was measured. A low frequency spectral analysis method is used to show that an appreciable periodic content exists in the sea return. This component in the scintillation spectra is 0.14 Hz and is related to the sea wave period. Wind-wave interaction effects are observed for up, down and crosswind directions. The clutter patch size and the incidence angle are used as a parameter. An optimum spectral response exists for upwind observations at an incidence angle of 1 deg and pulselength 0.08 microsec. The radar cross section per unit area measured is compared with an experimental sea clutter model. For wind directions resulting in an adequate fetch over open sea, reasonable agreement is found. No significant conclusions can be drawn with respect to megaripple observations. Author (ESA)

REMOTE SENSING OF SEA STATE BY LASER ALTIMETERS

B. Tsai and C. S. Gardner Dec. 1981 51 p refs
(Grant NsG-5049)
(NASA-CR-165049; RRL-Publ-514) Avail: NTIS HC A04/MF A01 CSCL 08C

The reflection of short laser pulses from the ocean surface was analyzed based on the specular point theory of scattering. The expressions for the averaged received signal, shot noise and speckle induced noise were derived for a direct detection system. It is found that the reflected laser pulses have an average shape closely related to the probability density function associated with the surface profile. This result is applied to estimate the mean sea level and significant wave height from the receiver output of the laser altimeter. T.M.

A GLOBAL ATLAS OF GEOS-3 SIGNIFICANT WAVEHEIGHT DATA AND COMPARISON OF THE DATA WITH NATIONAL BUOY DATA

J. D. McMillan Wallops Island, Va. NASA. Wallops Flight Center Nov. 1981 163 p refs
(Contract NAS6-2639)
(NASA-CR-156882) Avail: NTIS HC A08/MF A01 CSCL 08C

The accuracy of the GEOS-3 significant waveheight estimates compared with buoy measurements of significant waveheight were determined. A global atlas of the GEOS-3 significant waveheight estimates gathered is presented. The GEOS-3 significant waveheight estimation algorithm is derived by analyzing the return waveform characteristics of the altimeter. Convergence considerations are examined, the rationale for a smoothing technique is presented and the convergence characteristics of the smoothed estimate are discussed. The GEOS-3 data are selected for comparison with buoy measurements. The GEOS-3 significant waveheight estimates are assembled in the form of a global atlas of contour maps. Both high and low sea state contour maps are presented, and the data are displayed both by seasons and for the entire duration of the GEOS-3 mission. E.A.K.

HYDROLOGY AND WATER MANAGEMENT

Includes snow cover and water runoff in rivers and glaciers, saline intrusion, drainage analysis, geomorphology of river basins, land uses, and estuarine studies.

A82-10031 **Comparison of conventional and remotely sensed estimates of runoff curve numbers in southeastern Pennsylvania.** T. R. Bondelid, R. H. McCuen (Maryland, University, College Park, MD), and T. J. Jackson (Science and Education Administration, Plant Physiology Institute, Beltsville, MD). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 81-96.

The present study compares estimates of runoff curve numbers obtained using three different methods of identifying land cover: conventional surveys, land cover maps developed by the U.S. Geological Survey, and Landsat data. Data were tested on three watersheds in southeastern Pennsylvania. Accuracy was evaluated for various levels of drainage basin size, land use, and inhomogeneity of land cover distribution. It is found that the estimates of the runoff curve number were not highly sensitive to the source of the land cover data for typical watershed sizes and characteristics in this study area. Thus, accurate estimates can be obtained using less expensive remote sensing techniques. B.J.

A82-10032 **Satellite rainfall estimation for hydrologic forecasting.** R. K. Farnsworth (NOAA, Hydrologic Research Laboratory, Silver Spring, MD) and R. P. Canterford. In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 97-105. 14 refs.

The paper presents a method for evaluating current rainfall estimation techniques in terms of the requirements for flood and stage forecasting of rivers. An evaluation scheme has been developed based on equivalent rain gage density (ERGD). This scheme involves assigning ERGDs to the satellite techniques for specified time and space scales down to the order of three hours and 1/4 deg x 1/4 deg latitude/longitude grids. The scheme makes it possible to make intercomparisons among satellite techniques and to measure their improvement, if any, over information from existing operational rain gage networks. B.J.

A82-10033 **Mapping of the 1978 Kentucky River Flood from NOAA-5 satellite thermal infrared data.** C. P. Berg, D. F. McGinnis, Jr., and D. G. Forsyth (NOAA, National Environmental Satellite Service, Washington, DC). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 106-111.

The December 1978 Kentucky River Flood was analyzed using remotely sensed thermal infrared (IR) data from the Very High Resolution Radiometer (VHRR) onboard the NOAA-5 satellite. Computer-enhanced imagery and computer printouts permitted delineation of the flood boundaries; ground-based measurements indicate that this flood was a 200-year flood. Both manual photo-interpretive and automated computer analyses of the data indicate that NOAA-5 VHRR-IR data is a useful tool for flood delineation. (Author)

A82-10054 **Data sources for analyses of Great Lakes wetlands.** J. G. Lyon (Michigan, University, Ann Arbor, MI). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980,p. 516-528. 14 refs. Grant No. NOAA-04-8-M01-134.

This paper presents a comparison of data sources for assessing quantity and variety of coastal zone wetlands. The information supplying capabilities of aerial photography, Landsat imagery and SEASAT radar data were evaluated. This was accomplished by mapping wetlands, and by a change-detection analysis of wetlands in relation to Great Lake water levels. The value of each source is examined in a framework of data gathering and analysis for purposes of coastal zone management. (Author)

A82-10208 **Analysis of bright bands from 3-D radar data.** C. G. Collier (Meteorological Office, Malvern, Worcs., England), S. Lovejoy, and G. L. Austin (McGill Radar Weather Observatory, Montreal, Canada). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 44-47.

A practical scheme has been developed to automatically classify observed echo data into either stratiform rain, showers, or ground clutter using high resolution three-dimensional scanning radar. The technique involves the statistical determination of boundaries in n-dimensional space into m classes by the minimization of a general loss function, f. The reflectivity values are divided evenly into 30 classes, and a two-dimensional histogram of frequency-of-occurrence of the different 2-km, 3-km dBZ combinations is produced. The concentration of points is examined in relation to the line defined by reflectivity level at 3 km equals reflectivity level at 2 km. Points below the line indicate a positive vertical Z gradient, while points above indicate a negative one. Lines drawn to indicate the 50% contours represent the optimum boundaries for the technique when no more than two classes overlay at any one location with the two-dimensional 3 to 2 km reflectivity level plane. Errors in classification were found to be small (about 10%), and were usually a result of an error in only one category. J.F.

A82-10694 * # **A comparison of radiative transfer models for predicting the microwave emission from soils.** T. J. Schmugge (NASA, Goddard Space Flight Center, Hydrological Sciences Branch, Greenbelt, MD) and B. J. Choudhury (NASA, Goddard Space Flight Center, Hydrological Sciences Branch, Greenbelt; Computer Sciences Corp., Silver Spring, MD). *Radio Science,* vol. 16, Sept.-Oct. 1981, p. 927-938. 19 refs.

Noncoherent and coherent numerical models for predicting emission from soils are compared. Coherent models use the boundary conditions on the electric fields across the layer boundaries to calculate the radiation intensity, and noncoherent models consider radiation intensities directly. Interference may cause different results in the two approaches when coupling between soil layers in coherent models causes greater soil moisture sampling depths. Calculations performed at frequencies of 1.4 and 19.4 GHz show little difference between the models at 19.4 GHz, although differences are apparent at the lower frequency. A definition for an effective emissivity is also given for when a nonuniform temperature profile is present, and measurements made from a tower show good agreement with calculations from the coherent model. D.L.G.

A82-12553 **Effect of grain size and snowpack water equivalence on visible and near-infrared satellite observations of snow.** J. Dozier (California, University, Santa Barbara, CA), S. R. Schneider, and D. F. McGinnis, Jr. (NOAA, National Earth Satellite Service, Washington, DC). *Water Resources Research,* vol. 17, Aug. 1981, p. 1213-1221. 24 refs.

Satellite observations of snow in the near-infrared wavelengths can be used to roughly estimate snow grain size. When the grain size is large, it is possible to use measurements in the visible wavelengths to estimate snow water equivalence below some threshold value of around 100 mm. While sufficient data to fully evaluate these possibilities are not available, model calculations, selected satellite observations, and limited ground truth are in qualitative agreement. Complications arise because the effect of contamination by atmospheric aerosols is similar to that of finite depth, and because the near-infrared channel on the NOAA TIROS-N series satellites is not in the wavelength region where snow reflectance is most sensitive to grain size. (Author)

A82-12589 **Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, University of Wisconsin, Madison, WI, August 13, 14, 1980.** Conference sponsored by ASCE, ASP, and University of Wisconsin. Edited by R. W. Kiefer (Wisconsin, University, Madison, WI). New York, American Society of Civil Engineers, 1980. 199 p. $19.50.

Topics discussed include land applications, water applications, thermography applications, and general applications of remote sensing. Papers are presented on Landsat imagery for hydrologic modeling, satellite imagery and shoreline erosion prediction, water temperature mappings by infrared scanner, and aerial photography in fire risk assessment. Attention is also given to a data base system for real-time hydrologic modeling, the application of Landsat to the inventory of dams, and the operational use of Landsat for lake quality assessment. C.R.

A82-12592 * Landsat imagery for hydrologic modeling. R. S. Taylor, R. P. Shubinski, and T. S. George (Camp, Dresser and McKee, Inc., Springfield, VA). In: Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, Madison, WI, August 13, 14, 1980. New York, American Society of Civil Engineers, 1980, p. 44-52. NASA-supported research.

The cost and effectiveness of developing land cover information derived from Landsat imagery for hydrologic studies are compared with the cost and effectiveness of conventional sources. The analysis shows that the conventional and Landsat methods are nearly equally effective in providing adequate land cover data for hydrologic studies. The total cost effectiveness analysis demonstrates that the conventional method is cost effective for a study area of less than 26 sq km and that the Landsat method is to be preferred for areas of more than 26 sq km. C.R.

A82-12593 Application of Landsat to the inventory of DAMS. A. R. Blystra (FEderal Energy Regulatory Commission, Washington, DC) and R. R. Dumas (Chicago District, Corps of Engineers, Chicago, IL). In: Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, Madison, WI, August 13, 14, 1980. New York, American Society of Civil Engineers, 1980, p. 54-59.

A82-12595 Satellite imagery and shoreline erosion prediction. C. W. Welby (North Carolina State University, Raleigh, NC). In: Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, Madison, WI, August 13, 14, 1980. New York, American Society of Civil Engineers, 1980, p. 78-87. 11 refs.

A82-12596 * The operational use of Landsat for lake quality assessment. F. L. Scarpace (Wisconsin, University, Madison, WI) and L. T. Fisher (Maine, University, Orono, ME). In: Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, Madison, WI, August 13, 14, 1980. New York, American Society of Civil Engineers, 1980, p. 88-100. 10 refs. Research supported by the Wisconsin Department of Natural Resources, U.S. Environmental Protection Agency, and NASA.

A cooperative program between the Wisconsin Department of Natural Resources and the University of Wisconsin for the assessment, with Landsat data, of the trophic status of all the significant inland lakes in Wisconsin is described. The analysis technique is a semiautomatic data acquisition and handling system which, in conjunction with an analytical categorization scheme, can be used for classifying inland lakes into one of seven categories of eutrophication and one of four problem types. C.R.

A82-12597 Field study for Landsat water quality verification. D. S. Graham and J. M. Hill (Louisiana State University, Baton Rouge, LA). In: Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, Madison, WI, August 13, 14, 1980. New York, American Society of Civil Engineers, 1980, p. 101-117. 8 refs.

It is found that MSS data can be used to separate many water types in Apalachicola Bay, in Florida. Here, the images can be used to deduce circulation patterns. Circulation patterns for Landsat images are found to correspond clearly with both field data and numerical model results. The color intensity in the bay results from both dispersive mixing and a chemical reaction dependent on pH. C.R.

A82-12598 Water temperature mapping by infrared scanner. J. B. Evans (Texas Instruments, Inc., Dallas, TX). In: Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, Madison, WI, August 13, 14, 1980. New York, American Society of Civil Engineers, 1980, p. 118-122.

The state-of-the-art method of mapping water temperature using an airborne calibrated infrared scanner combined with computer corrections is described. The radiation measurements are digitized and coded onto computer tape during airborne survey operations. It is noted that the computer corrects for atmospheric effects that also change with scan angle, physics of temperature to radiation, water surface cooling or heating, system parameters, and map linearities. Scale maps of temperature are printed or plotted in any form that is available to the computer. The accuracy thus obtained allows computer maps to be combined to cover a large area with one-half degree accuracy. C.R.

A82-15037 Use of visible and thermal satellite data to monitor an intermittently flooding marshland. G. F. Byrne, G. N. Goodrick (Commonwealth Scientific and Industrial Research Organization, Div. of Land Use Research, Canberra, Australia), and K. Dabrowska-Zielinska (Instytut Geodezji i Kartografii, Warsaw, Poland). *Remote Sensing of Environment*, vol. 11, Nov. 1981, p. 393-399. 5 refs.

Selected thermal and visible data from the Heat Capacity Mapping Mission satellite for the Macquarie Marshes of Eastern Central Australia are examined in the light of a substantial volume of data from other sources, including Landsat, with a view to evaluating meteorological satellite data as ecological monitors for this landform. The results indicate that at least four important components of marshland can be mapped using HCMM data. The ecological status of marshland is intimately connected to their water status and visible and thermal imagery appears to be an economical and effective method of monitoring such systems. (Author)

A82-15961 † Study of the dynamics of the Danube delta using space images (Izuchenie dinamiki del'ty Dunaia s ispol'zovaniem kosmicheskikh snimkov). O. N. Efremova and V. I. Kravtsova (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). *Issledovanie Zemli iz Kosmosa*, Sept.-Oct. 1981, p. 90-96. In Russian.

Multispectral scanning images of the Danube delta, obtained by the Fragment system in September 1980, were compared with analogous images obtained by the Landsat satellite in September 1972. A study of these images revealed the dynamics of the delta over an eight year period. A map was constructed, reflecting the seaward extension of the Kiliiskaia part of the delta; it revealed an increase in water supply in some parts of the inner delta, and a decrease in water supply in other parts; it also showed a significant growth in agricultural land, featuring the appearance of rice fields in drained marshes, as well as other crop fields on terraces. J.F.

A82-15969 * In situ spectral reflectance studies of tidal wetland grasses. D. S. Bartlett (NASA, Langley Research Center, Marine and Applications Technology Div., Hampton, VA) and V. Klemas (Delaware, University, Newark, DE). *Photogrammetric Engineering and Remote Sensing*, vol. 47, Dec. 1981, p. 1695-1703. 16 refs. Research supported by the University of Delaware; Contract No. NAS5-20983.

Field measurements of wetland spectral canopy reflectance in the Landsat-MSS wavebands were correlated with biotic factors. The highest single band correlations were observed between visible (MSS Band 4: 0.5 to 0.6 micron and Band 5: 0.6 to 0.7 micron) canopy reflectance and the percentage, by weight, of live (green) vegetation in the canopies of Spartina alterniflora (salt marsh cordgrass), Spartina patens (salt meadow grass), and Distichlis spicata (spike grass). Infrared canopy reflectance displayed significant but weaker dependence on canopy parameters such as live and total biomass and canopy height. The Band 7 (0.8 to 1.1 microns)/Band 5 (0.6 to 0.7 micron) reflectance ratio was found to be highly correlated with green biomass for S. alterniflora. Highest spectral seperability between the 'low marsh' S. alterniflora and the 'high marsh' Salt Hay (S. patens and D. spicata) communities in Delaware occurs during December. (Author)

A82-17892 # Role of remote sensing in the study of acid rain impact on aquatic systems. J. R. Schott (Rochester Institute of Technology, Rochester, NY) and M. A. Wilkinson (New York, State

University, Buffalo, NY). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0336.* 10 p. 12 refs. Research supported by the New York State Energy Research and Development Authority.

Results are presented of a study of the capabilities of image analysis of remotely sensed data in the evaluation of the present state and past history of lakes subject to acidification by acid precipitation. Analysis of surface sampling data from nine Adirondack lakes reveals lake pH and alkalinity to be reflected in parameters related to optical properties, exhibiting a positive correlation with chlorophyll and total solids and a negative correlation with Secchi depth. Aerial photographic measurements of lake volume spectral reflectance, when compared with a simple laboratory model of the dependence of chlorophyll, lignin and humic acid contents of water on its optical properties, are also found to correlate with the differences between the in situ lake properties. Finally, analysis of Landsat band 4, 5 and 7 data obtained in September 1972 and 1979 for 18 lakes demonstrates the potential of the data for the isolation of lakes with low alkalinity, and for monitoring the rate of acidification over time providing data is properly calibrated for atmospheric, illumination and sensor response effects. Results thus demonstrate considerable potential for remote sensing in monitoring the impact of acidification on lakes, and point up the need for further studies of multi-temporal Landsat data and the techniques of aerial analysis. A82-17999 **An application of Landsat derived data to a regional hydrologic model.** D. P. Killpack and R. M. McCoy (Utah, University, Salt Lake City, UT). *Remote Sensing Quarterly*, vol. 3, Apr. 1981, p. 27-33. 8 refs.

An empirical, regional hydrologic model for predicting stream flow is developed based on the use of planimetric terrain variables obtainable from satellite imagery without stereo coverage. Measurements of basin area, basin perimeter, network length and main channel length were obtained from topographic maps and from Landsat imagery for 12 undiverted gaged streams essentially free of reservoirs and lakes in the Wasatch Mountains, and compared with stream flow variables in order to derive a regression equation for estimating stream discharge. Use of the equation expressing runoff as a function of basin area to predict runoffs in eight additional basins results in a correlation coefficient between predicted and observed values of 0.92, thus demonstrating the validity of the approach. A.L.W.

A82-18000 **The potential for use of Landsat data in water resources planning for the Missouri River Basin.** T. W. Lowe (Missouri River Basin Commission, Omaha, NE). *Remote Sensing Quarterly*, vol. 3, Apr. 1981, p. 34-41. 10 refs.

A82-18166 **An inertially-aided aircraft track recovery system for coastal mapping.** D. B. Reid, W. S. Gesing, B. N. McWilliam (Philip A. Lapp, Ltd., Toronto, Canada), and J. R. Gibson (Canada Centre for Remote Sensing, Ottawa, Canada). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 422-429. 10 refs.

A description is given of a new airborne system developed for charting shallow coastal and inland waters. The main components of this system are an aerial survey camera, a profiling laser radar, an analytical stereo plotter, and a multisensor track recovery system (TRS). The TRS comprises a gimballed inertial navigation system and several auxiliary sensors which require redundant position and attitude information. The sensor data are combined postmission with the aid of a U-D factorized Kalman filter and modified Bryson-Frazier smoother to compute precise estimates of the orientation parameters of the survey camera at the times of film exposure. These parameters are used in order to position each overlapping pair of photographs on the analytical plotter to form a stereo image and a corresponding analytical stereomodel from which water depth measurements are made. Flight trial results demonstrate that the TRS is able to achieve radial position and attitude accuracies which exceed 1 meter and 2 arcmin (RMS), respectively, and that this level of performance is sufficient to enable water depth measurements to be made to an accuracy of better than 0.65 m (RMS). A SYSTEMS APPROACH TO THE REAL-TIME RUNOFF ANALYSIS WITH A DETERMINISTIC RAINFALL-RUNOFF MODEL
Robert J. C. Burnash and R. Larry Ferral Apr. 1981 24 p refs
(PB81-224495; NOAA-TM-NWS-WR-162; NOAA-81050703)
Avail: NTIS HC A02/MF A01 CSCL 08H

The responsibility for providing the U.S. with warnings of river conditions was assigned to the National Weather Service in 1890. This requirement led to the development of a systems approach to hydrologic data collection, runoff computation, and forecast production. This system is focused on producing information on the future distribution of water in time and space which affects the safety, welfare, and economic well being of the nation and its inhabitats. A principal element of any hydrologic warning system is an effective rainfall-runoff model. GRA

SNOW-MAPPING EXPERIMENT
James C. Barnes, Clinton J. Bowley, J. Thomas Parr, and Michael D. Smallwood *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 191-224 refs

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08L

More than 300 hand-held camera photographs were taken of most part of the United States in which snow existed during the mission. The sites include the Sierra Nevada in California; the Salt-Verde Watershed in central Arizona; the Rocky Mountains in Colorado; the Great Salt Lake and Yellowstone Park in Utah and Wyoming; the Cascade Range in Washington and Oregon; the Black Hills in South Dakota; the Central Plains; and the Great Lakes. Snow in the European Alps; the Caucasus and Himalaya Mountains; the Pacific coastal areas of the U.S.S.R.; and New Zealand was also mapped. The experiment shows that: (1) a space observer can identify snow that photointerpreters cannot distinguish on a photograph of the same area, (2) can integrate, through partial cloud cover, to view the terrain, and (3) can select the optimum viewing angle and Sun angle and the appropriate film and filter combination to acquire the best data. REPORT ON SKYLAB 4 AFRICAN DROUGHT AND ARID LAND EXPERIMENT
N. H. MacLeod, J. S. Schubert, and P. Anaejionu *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 263-286 refs
Avail: NTIS MF A01; SOD HC $16.50 CSCL 08B

Vegetation patterns, flooding, soil erosion, interdunal water accumulation, natural drainage systems, and drainage patterns in the Black Volta and White Volta River basins were observed and photographed in an effort to determine the causes of desertification in the Sahel. The Niger Island delta in Mali was selected to examine the distribution and changing patterns of vegetation and flooding of the major freshwater resources in that drought-prone area. Observations Nimbus-3, Apollo-9, and Skylab of dust and cloud movements, vegetation patterns, land surface features, the color and distribution of surface water, and color changes of lakes within the drought zone show that widespread destructice land practices contribute to the arid conditions. PROGRESS IN RADAR SNOW RESEARCH

W. Stiles, F. T. Ulaby, A. K. Fung, and A. Aslam Feb. 1981 167 p refs
(Grant NsG-5335)
(NASA-CR-166709; RSL-TR-410-1) Avail: NTIS HC A08/MF A01 CSCL 08L

Multifrequency measurements of the radar backscatter from snow-covered terrain were made at several sites in Brookings, South Dakota, during the month of March of 1979. The data are used to examine the response of the scattering coefficient to the following parameters: (1) snow surface roughness, (2) snow liquid water content, and (3) snow water equivalent. The results indicate that the scattering coefficient is insensitive to snow surface roughness if the snow is drv. For wet snow, however, surface roughness can have a strong influence on the magnitude of the scattering coefficient. These observations confirm the results predicted by a theoretical model that describes the snow as a volume of Rayleig scatterers, bounded by a Gaussian random surface. In addition, empirical models were developed to relate the scattering coefficient to snow liquid water content and the dependence of the scattering coefficient on water equivalent was evaluated for both wet and dry snow conditions. A SIMULATION STUDY OF THE RECESSION COEFFICIENT FOR ANTECEDENT PRECIPITATION INDEX

Bhaskar J. Choudhury and Bruce J. Blanchard Nov. 1981 25 p refs Submitted for publication
(NASA-TM-83860) Avail: NTIS HC A02/MF A01 CSCL 08M

The antecedent precipitation index (API) is a useful indicator of soil moisture conditions for watershed runoff calculations and recent attempts to correlate this index with spaceborne microwave observations have been fairly successful. It is shown that the prognostic equation for soil moisture used in some of the atmospheric general circulation models together with Thornthwaite-Mather parameterization of actual evapotranspiration leads to API equations. The recession coefficient for API is found to depend on climatic factors through potential evapotranspiration and on soil texture through the field capacity and the permanent wilting point. Climatologial data for Wisconsin together with a recently developed model for global isolation are used to simulate the annual trend of the recession coefficient. Good quantitative agreement is shown with the observed trend at Fennimore and Colby watersheds in Wisconsin. It is suggested that API could be a unifying vocabulary for watershed and atmospheric general circulation modelars. Author

RECENT WORK IN PASSIVE OPTICAL IMAGING OF WATER

H. H. Zwick and S. C. Jain (Moniteq Ltd.) *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 189-194 refs
Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

The estimation of water quality and bathymetry with passive optical multispectral data imagery are described. A water quality algorithm was developed from a coordinated set of airborne, multispectral scanner, in situ water, and ground based atmospheric measurements made during coastal zone color scanner NIMBUS 7 passes over Lake Ontario. Modeling of atmosphere, the air water interface, and macroscopic as well as microscopic water optical characteristics gives fresh water estimates of the independently varying chlorophyll-a and total suspended mineral concentrations. Remotely measured radiances are corrected for atmosphere, specular sky reflection, and water refractivity in effects. The required parameters are estimated using a computer optimization routine. MAPPING OF SURFACE CURRENTS IN GREENLAND FIORDS BY MEANS OF LANDSAT IMAGES

Sten Folving *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 211-219 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Data from LANDSAT were used to study the propagation of meltwater into Soendre Stroemfjord. Water masses are classified on the basis of intensity profiles. These data trace meltwater sediment plumes and the character of the fronts between meltwater and pure fiord water. The main currents are mapped. River discharge from the south side is always up fiord due to pronounced Coriolis influence. A permanent down fiord current is found on the north side, with very complex patterns of current arising when the direction of the fiord channel shifts significantly. Author (ESA)

THE USE OF LANDSAT MSS TO OBSERVE SEDIMENT DISTRIBUTION AND MOVEMENT IN THE SOLENT COASTAL AREA

I. S. Robinson and D. Srisaengthong *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 221-232 refs Sponsored by UK Dept. of Industry

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

The LANDSAT multispectral data from the Solent area was used to explore the potential value to marine scientists of archived data on estuaries and coastal regions. Ten images from the archives were digitally enhanced by color slicing, yielding useful qualitative information when interpreted as suspended sediment. Two further clear weather images were obtained. An approximate calibration algorithm based on six archives band-5 images and non coincident field observations show good agreement with a synoptic calibration of the last two images. The calibrated archived images show similar seasonal variations to those observed. The possibility, for certain estuaries, of obtaining quantitive information from archived data, using only recent field observations, is suggested. Author (ESA)

THE EFFECT OF SPATIAL VARIABILITY IN PRECIPITATION ON STREAMFLOW

Keith J. Beven and George M. Hornberger Sep. 1981 40 p refs Submitted for publication Prepared in cooperation with Illinois State Water Survey, Urbana
(Contract DAAG29-80-K-0053; Grant NSF ATM-78-08865)
(AD-A105955; TR-6; ARO-16816.3-GS) Avail: NTIS HC A03/MF A01 CSCL 04/2

In most approaches to modelling the rainfall/runoff process, a spatially lumped description of precipitation has been assumed adequate for modelling the important aspects of catchment response. However, theories of catchment hydrology as well as some recent modelling studies suggest that spatial variability in precipitation may be important in determining the characteristics of streamflow hydrographs. Data from two intensive rainfall recording experiments in Illinois have been used to examine the effects of rainfall pattern on stream hydrographs for summer convective storms. A threshold analysis was used to distinguish storms of markedly different pattern. A mixed deterministic/stochastic modelling procedure was used to determine the length of record required to differentiate the hydrograph characteristics resulting from storms of different patterns. It was found that differences in peak timing were highly significant but that differences in the distributions of peak flow and stormflow volumes were generally insignificant even given a long period of record. ANALYSIS OF RAINFALL FROM FLASH FLOOD PRODUCING THUNDERSTORMS, USING GOES DATA

Roderick A. Scofield *In* ESA Nowcasting: Mesoscale Observations and Short-Range Prediction Jun. 1981 p 51-58 refs

Avail: NTIS HC A19/MF A01; ESA, Paris FF 160 Member States, AU, CN and NO (+20% others)

The use of the Scofield-Oliver GOES technique for estimating convective precipitation from flash flood producing thunderstorms is discussed. The technique is applied using imagery displayed with a digital enhancement curve. Estimates of convective rainfall are done by comparing the changes in two consecutive pictures, both infrared and high resolution visible. The method is applied to two flash flood events. The estimates as compared to the observed rainfall are good. However, a warm top modification is needed for thunderstorms whose expected anvil temperatures are warmer than -62C. Author (ESA)

QUANTITATIVE ANALYSIS OF DRAINAGE OBTAINED FROM AERIAL PHOTOGRAPHS AND RBV/LANDSAT IMAGES [ANALISE QUANTITATIVA DA DRENAGEM OBTIDA ATRAVES DE FOTOGRAFIAS AEREAS E IMAGENS DO RBV/LANDSAT]
Nelson deJesusParada, Principal Investigator, Antonio Roberto Formaggio, Jose Carlos Neves Epiphanio, and Mario Valerio Filho
May 1981 29 p refs In PORTUGUESE; ENGLISH summary Presented at the 33rd Reuniao Anual de SBPC Sponsored by NASA ERTS
(E82-10008; NASA-CR-164906) Avail: NTIS HC A03/MF A01 CSCL 08H

Data obtained from aerial photographs (1:60,000) and LANDSAT return beam vidicon imagery (1:100,000) concerning drainage density, drainage texture, hydrography density, and the average length of channels were compared. Statistical analysis shows that significant differences exist in data from the two sources. The highly drained area lost more information than the less drained area. In addition, it was observed that the loss of information about the number of rivers was higher than that about the length of the channels. Author

DATA PROCESSING AND DISTRIBUTION SYSTEMS

Includes film processing, computer technology, satellite and aircraft hardware, and imagery.

A82-10027 **American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers.** Falls Church, VA, American Society of Photogrammetry, 1980. 552 p. $10.

Consideration is given to such topics as digital classification accuracy, hydrometeorology, computational photogrammetry, digital image processing and rectification, the role of remote sensing in continuing education and professional development, digital displays, and the application of orthophotography in highway planning and construction. Also examined are the analysis of Landsat MSS data, remote sensor systems, close-range photogrammetry, the use of aerial photography in remote sensing, photogrammetric instruments, and automated cartography. B.J.

A82-10038 **Applications of digital displays in photointerpretation and digital mapping.** B. L. Schrock (U.S. Army, Computer Sciences Laboratory, Fort Belvoir, VA). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 201-212.

The Digital Image Analysis Laboratory (DIAL) at USAETL is a large-scale interactive system designed for research and development activities in digital image processing. The system has been successfully applied to a variety of investigations in both digital mapping and photointerpretation as described in this presentation. Recently a Demonstration Image Processing System (DEMONS) has been added to the DIAL system to serve as a high-speed work station for processing very large digital images. Although DEMONS has been reasonably successful in manipulating large images, its limitations indicate that future such systems might be hybrid systems combining the best features of both hardcopy (film) and softcopy (cathode ray tube) exploitation systems. (Author)

A82-10860 **Two-dimensional resampling of line scan imagery by one-dimensional processing.** D. E. Friedmann (MacDonald, Dettwiller and Associates, Ltd., Richmond, British Columbia, Canada). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Oct. 1981, p. 1459-1467. 33 refs. Research supported by the Department of Industry, Trade and Commerce.

Geometric correction of remote sensing data, such as Landsat MSS data, requires two-dimensional resampling. The resampling operation is typically carried out in two one-dimensional operations: along and across scan lines. The usual reasons given for validating the procedure are lower cost and higher speed. The theoretical assumptions under which one-dimensional processing is valid are presented in the light of current and future remote sensing sensors. It is shown that the assumptions are violated when a substantial amount of image rotation is incorporated into the precision processing. A method to perform image rotation with an additional step using one-dimensional processing is presented. The method makes precision correction and alignment of remote sensing data, to a map projection, both possible and accurate with one-dimensional processing. (Author)

A82-10861 **Estimation of atmospheric path-radiance by the covariance matrix method.** P. Switzer, W. S. Kowalik, and R. J. P. Lyon (Stanford University, Stanford, CA). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Oct. 1981, p. 1469-1476. 16 refs.

A new method has been developed as an extension of Chavez's Regression Technique (Chavez, 1975) to provide estimates of the atmospheric path-radiance in the four Landsat MSS bands. The extension uses the correlation between all four bands of data simultaneously instead of in pairs. The Regression Method and this extension do not require auxiliary data, but operate solely upon the digital numbers recorded on the Landsat tapes. Furthermore, they do not require the presence of sites of low reflectance (basalt flows, clear lakes) or sites of low irradiance (shadows due to topography or clouds) in the Landsat data, or topographic slope data. Instead, we use Landsat data from areas of homogeneous reflectance in hilly terrain as test areas for estimation of the band-specific atmospheric path-radiances. The method has been applied to Landsat data from diverse terrain types and atmospheric conditions using three different Landsat images covering semi-arid western Nevada, temperate eastern Pennsylvania, and tropical central New Guinea. The method yields reasonable results from each area. (Author)

A82-12757 **A theory of wave scattering from an inhomogeneous layer with an irregular interface.** A. K. Fung and H. J. Eom (Kansas, University, Lawrence, KS). *IEEE Transactions on Antennas and Propagation,* vol. AP-29, Nov. 1981, p. 899-910. 10 refs. NSF Grant No. ENG-79-09374; Grant No. DAAG29-80-K-0018.

Bistatic wave scattering from a layer of Rayleigh scatterers with an irregular interface is studied by combining the doubling method in volume scattering with the Kirchhoff method in rough surface scattering. Theoretical results are presented illustrating the effect of the rough interface. It is found that for scattered and incident angles near the vertical, the rough interface brings about a substantial increase relative to the plane interface in both the like and cross-scattering coefficients over all azimuth angles. For large scattered and incident angles, however, the reverse is true, except for azimuth angles around the specular direction. C.R.

A82-12882 **Digital mapping using entities - A new concept.** S. E. Masry (New Brunswick, University, Fredericton, Canada). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Nov. 1981, p. 1561-1565.

An approach to digital mapping using aerial or satellite photography is presented which is based on the use of linear features to establish the relationship between an image and a ground coordinate system in lieu of or in addition to individual control points. The concept is based on entity-to-entity correspondence, an entity being defined as a set of points describing part or the whole of a feature. It involves the transformation of the mathematical functions defining the observed entities in order that they become identical to the corresponding functions describing control entities obtained from a topographic data base or map. The concept has successfully been applied to carry out the absolute orientation of a stereomodel, and perform analytical space resection of an aerial photograph, with precision and convergence comparable to those derived from conventional control. S.C.S.

A82-12913 † **Aspects in the development of aerial-photography tasks (Voprosy razvitiia aerofotos'emochnykh rabot).** Iu. I. Poletaev. *Geodeziia i Kartografiia,* Sept. 1981, p. 32-34. In Russian.

Recent developments in aerial photography in the Soviet Union are briefly reviewed. Attention is given to calibration methods, ways to improve the quality of negatives, optimal exposure techniques, scaling, and automated processing. B.J.

A82-13121 **Interactive techniques for estimating precipitation from GOES imagery.** J. F. Moses, L. E. Spayd, Jr., R. S. Gird, and A. L. Siebers (NOAA, National Earth Satellite Service, Washington, DC). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 2. New York, American Institute of Chemical Engineers, 1981. 9 p. (TP-6C). 6 refs.

Recent development of an interactive computer technique aids meteorologists in using geostationary satellite imagery to estimate precipitation. The interactive technique utilizes the interpretive abilities and experience of the meteorologist with the speed and accuracy of the computer to reduce the time and effort required by the previously developed manual method. An analysis of a precipitation event in Kansas on July 4-5, 1979, illustrates the technique. A comparison of satellite estimates to ground truth reports shows that the estimates indicate the areas of maximum observed precipitation accumulation. (Author)

07 DATA PROCESSING AND DISTRIBUTION SYSTEMS

A82-13633 † **Calculation of the decrease in the contrast of objects of a place due to light scattering in the atmosphere (O vychislenii padeniia kontrasta ob'ektov mestnosti iz-za rasseianiia sveta v atmosfere).** Iu. L. Biriukov and E. G. Markarian (Moskovskii Institut Inzhenerov Geodezii, Aerofotos'emki i Kartografii, Moscow, USSR). *Geodeziia i Aerofotos'emka,* no. 4, 1981, p. 80-86. 9 refs. In Russian.

With reference to aerial photography, an analytical method is presented for calculating the decrease in the image contrast of small-scale objects on the earth's surface due to light scattering in the atmosphere. An analysis is presented of the dependence of the contrast of the object and background, observed through the optical medium, on the optical thickness of the atmosphere, the solar zenith distance, the angles of sight, and the albedo of the object and background. Numerical results are presented. B.J.

A82-13634 † **Concerning the geometric accuracy of infrared scanner photographs (K voprosu o geometricheskoi tochnosti infrakrasnykh skanernykh snimkov).** O. I. Egorova (Moskovskii Institut Inzhenerov Geodezii, Aerofotos'emki i Kartografii, Moscow, USSR). *Geodeziia i Aerofotos'emka,* no. 4, 1981, p. 113-116. In Russian.

The sources of geometric errors of infrared scanner images are examined along with methods to eliminate these errors. Experimental results concerning the accuracy of infrared scanner photographs are presented. B.J.

A82-14860 **Reflectivity and emissivity of snow and ground at mm waves.** R. D. Hayes, N. C. Currie, and J. A. Scheer (Georgia Institute of Technology, Atlanta, GA). In: International Radar Conference, Arlington, VA, April 28-30, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 67-72.

A summary is provided of the results of a test program conducted to determine the backscatter and emissivity characteristics of background clutter at millimeter wavelengths. The test was conducted during the late winter time frame to include snow and wet terrain as background types. It is pointed out that active and passive millimeter wave RF sensors are prime candidates for the role of air-to-surface anti-armor weapons applications because of certain advantages compared to microwave sensors and electro-optical sensors. However, the design, development, and evaluation of systems for such an application requires an extensive understanding of the millimeter wavelength reflectivity and emissivity characteristics of clutter and targets. It was found in the investigation that the radar reflectivity of the snow varies strongly with the diurnal freeze-melt cycle. Radar cross sections for short and tall grass are also considered. G.R.

A82-14870 * **A digital fast correlation approach to produce SEASAT SAR imagery.** C. Wu (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: International Radar Conference, Arlington, VA, April 28-30, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 153-160. 9 refs. Contract No. NAS7-100.

This paper describes a digital processing algorithm and its associated system design for producing images from SEASAT Synthetic Aperture Radar (SAR) data. The proposed system uses the fast Fourier transform approach to perform the two-dimensional correlation process. The range migration problem, which is often a major obstacle to efficient processing, can be alleviated by approximating the locus of echoes from a point target by several linear segments. SAR data corresponding to each segment is correlated separately, and the results are coherently summed to produce full-resolution images. This processing approach exhibits high computation efficiency and simple processing control functions. It is particularly attractive for software implementation based on general purpose computer. Results of this implementation and examples of digitally correlated SEASAT SAR imagery are discussed. B.J.

A82-15003 # **Investigations concerning the image-controlled segmentation of objects in multispectral imagery data (Untersuchungen zur bildgesteuerten Separierung von Objekten in multispektralen Bilddaten).** R. Schärf. Karlsruhe, Universität, Fakultät für Elektrotechnik, Dr.-Ing. Dissertation, 1981. 157 p. 74 refs. In German.

The automatic segmentation of objects in an image represents an essential step in a procedure for the interpretation of images. The considered investigation is concerned with image-controlled processes, based on sequential operations, for the extraction of areal objects from real multispectral imagery. A survey is presented of various operational principles used for image segmentation, and a description is provided of the characteristics of multispectral imagery data. Problems of data compression are examined, and different segmentation procedures are compared. This comparison leads to the development of a two-stage procedure for the segmentation of objects on the basis of region growing. Important aspects of the new procedure are related to sequential iterative processing and the initial control of the processing steps by means of automatically extracted structural image elements. At a later stage, the characteristics and the position of the segmented objects provide additional control elements. G.R.

A82-15029 **Two-dimensional model variability in thermal inertia surveys.** D. A. Pratt (Newcastle, University, Newcastle, Australia). *Remote Sensing of Environment,* vol. 9, June 1980, p. 325-338. 20 refs. Research supported by the Australian Research Grants Committee.

Calibration of thermal inertia surveys requires the production of a numerical model where thermal inertia is expressed as a function of the diurnal ground surface temperature range and albedo. The model is calculated for a given set of local meteorological and surface conditions which must be assumed constant over the whole of the surveyed area. This paper reports the results of an investigation which estimates the magnitudes of thermal inertia errors as a function of the departure of the local conditions from those assumed. The parameters under investigation are wind speed, average air temperature, air-temperature fluctuations, surface roughness, slope and changes in the thermal inertia profile. (Author)

A82-15034 * **Texture transforms of remote sensing data.** J. R. Irons (NASA, Goddard Space Flight Center, Earth Resources Branch, Greenbelt, MD) and G. W. Petersen (Pennsylvania State University, University Park, PA). *Remote Sensing of Environment,* vol. 11, Nov. 1981, p. 359-370. 16 refs.

Tone and texture are fundamental interrelated visual concepts. The concepts are used for the digital analysis of remotely sensed image data. The reported investigation had the objective to develop software for the quantification of image texture and to apply the texture information to both image enhancement and thematic classification of remotely sensed data. The quantitative texture information was applied to the analysis of Landsat-2 Multispectral Scanner Subsystem (MSS) data. Attention is given to the characterization of image texture, textured transformations, the subtext program, and a description of methods and results. It is pointed out that the inability to use the texture transforms of the Landsat MSS data for the thematic mapping of the study area's land cover contrasts sharply with the reported results of the textural analysis of digitized aerial photography by Hsu (1978). G.R.

A82-15125 * **Optically processed Seasat radar mosaic of Florida.** M. L. Bryan (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Sept. 1981, p. 1335-1337.

An uncontrolled mosaic of optically correlated Seasat radar imagery of Florida is presented to illustrate the data and the large area synoptic coverage made possible by combining multiple data sets. The images were taken from a total of 12 passes over 33 days from July 24, 1978 to August 27, 1978. The mosaic is controlled geometrically and with respect to image tone (representing radar backscatter). The SAR data was obtained at an L-band frequency (1.275 GHz, 23.5 cm) and in a horizontal transmit/receive mode, resulting in a 25 m resolution in 100 km swath widths. M.S.K.

A82-15764 **Compensation of systematic errors in bundle adjustment.** E. Kilpela, J. Heikkila, and K. Inkila (Helsinki University of Technology, Esbo, Finland). *Photogrammetria,* vol. 37, Nov. 1981, p. 1-13. 7 refs.

Results of the application of a bundle program to study the effects of weighted additional parameters on the accuracy and reliability of self-calibration are examined. Six additional parameter sets used with and without weighting, as well as a comparison of simultaneous and a posteriori self-calibration are studied. General features of the program are outlined, and the program is applied to photography of test areas at 1:4000 and 1:12,000 scales. Root mean square errors in planimetry and height are used as quantities for determining the effectiveness of compensation of systematic errors. Best results were obtained by employing weights corresponding to image point displacements of less than five micrometers, and weights equal to zero, especially in cases of minor side overlap. Simultaneous self-calibrations proved more efficient than a posteriori self-calibration. M.S.K.

A82-15765 **Compensation of systematic errors of image and model coordinates.** E. Kilpela (Helsinki University of Technology, Esbo, Finland). *Photogrammetria,* vol. 37, Nov. 1981, p. 15-44. 9 refs.

Compensation for systematic errors of image and model coordinates in different aerotriangulation methods is studied. Four test fields in Australia and Finland used for the photogrammetric adjustments were coordinated by a ground survey. Flight programs and measurements are outlined, and compensation procedures comprised reference adjustment, component calibration, test field calibration, and self calibration. Blockwise vs stripwise parameters, significance testing of additional parameters, weighting of additional parameters, correlations, and a priori data refinements, as well as side overlap, single vs double block, control point pattern, and the use of a reseau to correct film distortion were considered. Calibration improved the triangulation by 20%, self calibration produced results superior to test field calibration, and the introduction of strip invariant additional parameters was found to be ineffective. M.S.K.

A82-15970 **Cost effective computer processing of airborne scanner data for regional level mapping.** S. Thiruvengadachari (National Remote Sensing Agency, Hyderabad, India). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Dec. 1981, p. 1705-1708.

The reported investigation concerning an optimization of the computer analysis of multispectral data was conducted in connection with an airborne scanner survey over an area of approximately 750 sq km in the northeastern part of India. The survey was conducted to obtain information with regard to flood inundation along a selected range of a major river system. Digital analysis was performed on the interactive Multispectral Data Analysis System, operated at the National Remote Sensing Agency facility at Hyderabad. An 11 channel scanner mounted on a DC-3 Dakota aircraft was used in the survey. Attention is given to the study background, analysis methodology, categorical analysis, and categorization accuracy. It was found that the computer analysis of 11-channel airborne scanner data can be made cost effective by the use of fewer channels, when regional selection of level information is to be obtained. G.R.

A82-15971 * **The Control Point Library Building System.** W. Niblack (IBM France, S.A., Paris, France). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Dec. 1981, p. 1709-1715. 7 refs. Contracts No. NAS5-22999; No. NAS5-23790.

The Earth Resources Observation System (EROS) Data Center in Sioux Falls, South Dakota distributes precision corrected Landsat MSS and RBV data. These data are derived from master data tapes produced by the Master Data Processor (MDP), NASA's system for computing and applying corrections to the data. Included in the MDP is the Control Point Library Building System (CPLBS), an interactive, menu-driven system which permits a user to build and maintain libraries of control points. The control points are required to achieve the high geometric accuracy desired in the output MSS and RBV data. This paper describes the processing performed by CPLBS, the accuracy of the system, and the host computer and special image viewing equipment employed. (Author)

A82-15973 **Orientation and construction of models. III - Mathematical basis of the orientation problem of one-dimensional central perspective photographs.** A. Okamoto (Kyoto University, Kyoto, Japan). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Dec. 1981, p. 1739-1752. 9 refs.

The reported analysis of the general orientation problem of one-dimensional central perspective photographs makes use of the mathematical basis employed in the orientation problem of two-dimensional (conventional) central perspective pictures. The general orientation problem of a stereoscopic pair of one-dimensional photographs is considered, taking into account also the special case in which the interior orientation parameters are known. Attention is given to the photogrammetric orientation problem of one-dimensional central-perspective photographs, and the orientation problem in the case of individual one-dimensional photographs. G.R.

A82-16160 **Spectral correlation filters and natural colour coding.** N. J. Mulder (International Institute for Aerial Survey and Earth Sciences, Enschede, Netherlands). *ITC Journal,* no. 3, 1981, p. 237-252.

A system utilizing spectral correlation filters and natural color coding has been developed for remote sensing. Studies of principal components (Mulder and Hempenius, 1974) have shown that there are only two or three independent factors in reflectance spectra of natural materials. Filters have thus been designed to store reflection spectra of water, dense green vegetation, and bare soil using a natural color coding scheme. Nearly all other natural reflection spectra can be described as a linear combination of these three spectra. The method has been tested for a simulation using Landsat data. S.C.S.

A82-16163 **Theoretical reliability of elementary photogrammetric procedures.** I. F. A. A. F. Amer (International Institute for Aerial Survey and Earth Sciences, Enschede, Netherlands). *ITC Journal,* no. 3, 1981, p. 278-307. 10 refs.

The reliability of elementary photogrammetric procedures for production photogrammetrists is presented. The derivation of the weight coefficient matrix of the residuals is obtained, noting its structure and the significance of its main and off-diagonal elements. For high homogeneous reliability, the main diagonal elements should be close to unity and equal. When all the main diagonal elements are equal the reference boundary value is achieved. The difference between detection and location of gross errors is illustrated. It is shown that a rejection matrix may be employed to evaluate the possibility of locating gross errors. S.C.S.

A82-16601 **Airborne and spaceborne multispectral photography of the earth (Mnogozonal'nye aerokosmicheskie s'emki zemli).** R. Z. Sagdeev. Moscow, Izdatel'stvo Nauka, 1981. 304 p. In Russian.

Multispectral scanning of earth resources is considered, with attention given to the Soyuz-22 Raduga experiment, optical scanning, remote spectroscopy, polarimetry methods, analog processing, and digital processing. Particular consideration is given to such topics as the parameter optimization of spaceborne photography systems, the instrumental interpretation of multispectral aerial and space photographs, a special-purpose optoelectronic system for the operational acquisition of multispectral image data, the energy calibration of multispectral scanner systems, and the maximum mean accuracy of classification of remote-sensing objects. B.J.

A82-16605 † **Evaluation of the information content of the channels of spaceborne multispectral photography of the Fergana region by the MKF-6 camera from Soyuz-22 (Otsenka i informativnosti kanalov mnogozonal'noi kosmicheskoi fotos'emki Ferganskogo uchastka kameroi MKF-6 s kosmicheskogo korablia 'Soiuz-22').** G. B. Gonin and V. P. Koroleva. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 24-37. 10 refs. In Russian.

A82-16606 † **Geometric quality of MKF-6 photographs (Geometricheskoe kachestvo snimkov MKF-6).** Ia. L. Ziman, V. A. Krasikov, and V. I. Iurov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 37-43. In Russian.

The photogrammetric calibration and digital processing of multispectral photographs obtained with the MKF-6 camera in the Raduga experiment aboard Soyuz-22 are considered. It is shown that the MKF-6 photographs are topographic ones and can be used to solve many kinds of photogrammetric problem. B.J.

A82-16607 † **Methods of instrumental interpretation of multispectral aerial and space photographs (Metody izmeritel'nogo deshifrirovaniia mnogozonal'nykh aerokosmicheskikh snimkov).** I. A. Labutina and Iu. I. Fivenskii. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 43-55. 7 refs. In Russian.

A82-16612 † **Spectrometric studies of the earth's surface (Spektrometricheskie issledovaniia zemnoi poverkhnosti).** G. A.

Avanesov and N. I. Snetkova. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 100-117. 95 refs. In Russian.

A review of the literature on the remote spectroscopy of earth resources is presented. A classification of terrestrial features on the basis of spectral characteristics is considered. B.J.

A82-16614 † **The application of holographic gratings in spectrometers for the spatial-spectral analysis of the earth's surface from aerial and space platforms in the visible and near-infrared spectral regions (K voprosu o primenenii golograficheskikh reshetok v spektrometrakh dlia prostranstvenno-spektral'nogo analiza zemnoi poverkhnosti s aerokosmicheskikh platform v vidimom i blizhnem ik-diapazonakh spektra).** E. G. Lykasheva. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 128-135. 6 refs. In Russian.

A82-16615 † **The maximum mean accuracy of classification of remote-sensing objects and the influence on this accuracy of data acquisition and processing methods (Dostizhimaia sredniaia tochnost' klassifikatsii ob'ektov distantsionnogo zondirovaniia i vliianie na nee metodov sbora i obrabotki dannykh).** B. M. Balter. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 135-151. In Russian.

A review of the literature on the classification of remote-sensing objects is used to investigate the mean accuracy of classification. This accuracy was found to be 82% and (with a probability of 0.95) not lower than 55%. Current methods of automatic classification produce an increase of 8% compared with nonautomatic methods. The mean accuracy in the period 1972-1977 was found to increase by 1% every year. Such factors as type of sensor, platform, and data processing do not have an appreciable influence on the mean accuracy. B.J.

A82-16616 † **Characteristics of the photometry of small objects from aerial and space photographs (Osobennosti fotometrirovaniia malykh ob'ektov po aerokosmicheskim fotosnimkam).** Iu. I. Fivenskii and Iu. N. Kuznetsov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 152-164. 8 refs. In Russian.

The current status of the method of microphotometric determinations from remotely sensed images is described, and results of a laboratory experiment are presented. It is shown that the photometric properties are invariant to the geometry and distribution characteristics of small details on the photograph. Requirements on the photometric calibration of aerial and space photography systems are examined. B.J.

A82-16617 † **Estimation of the brightness field from results of multispectral photography of the earth from space (Otsenka iarkostnogo polia po rezul'tatam mnogozonal'nogo fotografirovaniia zemli iz kosmosa).** V. A. Kotsov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 165-169. In Russian.

A method for the statistical estimation of brightness and spectral contrasts for the territory of the USSR on the basis of data from the Soyuz-22 Raduga experiment is presented. The statistical characteristics of the contrasts are given. B.J.

A82-16618 † **The use of a priori information in the remote sensing of the earth from space (Ispol'zovanie apriornoi informatsii pri izuchenii zemli iz kosmosa).** V. A. Kottsov and I. B. Prokuronov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 170-174. 5 refs. In Russian.

The relationship between the concept of an object in remote sensing and the characteristics of a priori information is examined in the framework of pattern recognition theory. The improvement of remote sensing methods by using the representation of localized factors is considered. B.J.

A82-16621 † **The choice of the orientation of the analyzer in polarimetric surveys (O vybore orientatsii analizatora pri poliarizatsionnoi s'emke).** V. V. Egorov and B. S. Zhukov. In: Airborne and spaceborne multispectral photography of the. earth. Moscow, Izdatel'stvo Nauka, 1981, p. 197-202. In Russian.

An analysis is presented of the conditions of achieving maximum contrast in polarimetric remote-sensing surveys. It is found that for surveys of soil-vegetation objects the maximum contrast is generally attained when the analyzer is oriented parallel to the solar-vertical plane. Experimental results on such surveys are presented. B.J.

A82-16623 † **Analog methods for processing multispectral photographs (Ob analogovykh metodakh obrabotki mnogozonal'nykh fotosnimkov).** Iu. M. Chesnokov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 211-216. In Russian.

The possibilities of analog techniques for the processing of multispectral photographs are reviewed. Particular attention is given to the development of laser-based analog optoelectronic devices for the conversion of multispectral images into color images. B.J.

A82-16625 † **Structural analysis of aerial and space images (Strukturnyi analiz aerokosmicheskikh snimkov).** K. A. Kraush. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 224-234. 10 refs. In Russian.

The theoretical principles of the structural analysis of remote sensing images are presented. A block diagram of an optoelectronic device for performing the structural analysis is given, and possible variants of the optical system are examined. The calculation of the intensity of the components of the spatial-frequency spectrum is considered, and the influence of noise is assessed. B.J.

A82-16626 † **Investigation of the spatial structure of space images of the earth's surface (Izuchenie prostranstvennoi struktury kosmicheskikh izobrazhenii zemnoi poverkhnosti).** V. V. Egorov and G. P. Arumov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 235-243. In Russian.

Aspects of the texture analysis of space photographs of the earth's surface are discussed. The analysis of the spatial structure was carried out by two methods: an analog technique for the formation of spatial-frequency spectra (Wiener spectra) and an analytic method for the component separation of mixtures of natural objects. Examples of analysis are presented. B.J.

A82-16627 † **Processing of multispectral image data on special-purpose computer systems (Obrabotka mnogozonal'noi videoinformatsii na spetsializirovannykh vychislitel'nykh kompleksakh).** V. A. An analysis is presented of the use of affine transformations in the processing of multispectral photographs of earth resources and their transformation to the Kavraiskii cartographic projection. The optimization of access to the images is assured by a programmable virtual memory. B.J.

A82-18167 **Photo inertial positioning system development at the Canada Centre for Remote Sensing.** J. R. Gibson and J. E. Smyth (Canada Centre for Remote Sensing, Ottawa, Canada). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 436-438.

The system and projects described form part of the continuing development work on the Photo Inertial Positioning System at the Canada Centre for Remote Sensing. The system consists of an aerial camera having navigation systems and sensors hard-mounted to it. A general-purpose data acquisition system is used in time-correlating the data from these and other sensors. It is noted that during the past several years, the system development has been slanted toward the application of shallow water charting. The system is at present capable of providing postflight position accuracies of the order of 1 meter and attitude accuracies of 1 arcmin. C.R.

COMPUTATIONAL ASPECTS OF GEOMETRIC CORRECTION DATA GENERATION IN THE LANDSAT-D IMAGERY PROCESSING
I. Levine *In* NASA. Goddard Space Flight Center Sixth Ann. Flight Mech./Estimation Theory Symp. Oct. 1981 16 p ref

(Contract NAS5-25300)
Avail: NTIS HC A13/MF A01 CSCL 05B

A method is presented for systematic and geodetic correction data calculation. It is based on presentation of image distortions as a sum of nominal distortions and linear effects caused by variation of the spacecraft position and attitude variables from their nominals. The method may be used for both MSS and TM image data and it is incorporated into the processing by means of mostly offline calculations. Modeling shows that the maximal of the method are of the order of 5m at the worst point in a frame; the standard deviations of the average errors less than .8m. Author

SMALL-SCALE TERRAIN MAPPING BASED ON NUMERICAL INTERPRETATION OF LANDSAT IMAGERY [LANDSAT-KUVIEN NUMEERISEEN TULKINTAAN PERUSTUVA PIENKAAVAINEN MAASTOKARTOITUS]
Esa Fransaila 1981 75 p refs In FINNISH; ENGLISH summary Original contains color illustrations
(VTT-40; ISBN-951-38-1180-8; ISSN-0355-3477) Avail: NTIS HC A04/MF A01

The usability of digital LANDSAT imagery for producing terrain data, the general map of Finland (1: 400,000) and other small-scale terrain maps was investigated. The image processing was based on numerical processing of: image correction to map projection; image interpretation; data generalization; and graphic output along with statistical summary data. In order to achieve an automated cartographic generalization, the scale caused details were effaced by applying alternative rules. Compared with the conventional generalization, the result is defective. Figure lines for cartographic presentation were produced. Author (ESA)

IDENTIFICATION OF LITHOLOGIC UNITS USING MULTI-CHANNEL IMAGING SYSTEMS Ph.D. Thesis
Diane Louise Evans 1981 129 p
Avail: Univ. Microfilms Order No. 8121194

It is shown that is possible to compare laboratory reflectance spectra directly with multispectral images. The signal that would be produced if a particular laboratory sample were in a detector's field of view was calculated and converted into a digital number of DN value. Stacks of spatially registered multispectral images were then searched for materials that had spectral characteristics similar to the laboratory samples. When laboratory reflectance spectra of a suite of Hawaiian samples were compared to Viking Lander images of Mars, a weathered basaltic tephra from a Hawaiian cinder cone was found to have spectral characteristics that were similar in all bandpasses to surficial deposit at the Viking 1 site. When the reflectance spectra of the suite of samples were compared to Viking Orbiter images, the same Hawaiian tephra was found to correspons to a regional spectral unit in the low latitudes of Mars. It was also possible to compare laboratory reflectance spectra to Landsat images of the Earth. Comparison of laboratory reflectance spectra with multispectral images make it possible to derive compositional information from the images. Dissert. Abstr.

ANALYSIS OF SOIL MOISTURE EXTRACTION ALGORITHM USING DATA FROM AIRCRAFT EXPERIMENTS Final Report
Hsiao-hua K. Burke and Jean-Hsien Ho Jun. 1981 37 p refs
(Contract NAS5-26361)
(NASA-CR-166719; P-A826) Avail: NTIS HC A03/MF A01 CSCL 08M

A soil moisture extraction algorithm is developed using a statistical parameter inversion method. Data sets from two aircraft experiments are utilized for the test. Multifrequency microwave radiometric data surface temperature, and soil moisture information are contained in the data sets. The surface and near surface (< or = 5 cm) soil moisture content can be extracted with accuracy of approximately 5% to 6% for bare fields and fields with grass cover by using L, C, and X band radiometer data. This technique is used for handling large amounts of remote sensing data from space. S.L.

RADAR CORRELATION WITH ICE DEPOLARIZATION MEASUREMENTS OF THE 28.56 GHz COMSTAR BEACON AND ASSOCIATED CROSS POLARIZATION STATISTICS
Julius Goldhirsh Aug. 1980 51 p refs
(NASA-CR-166717; JHU/APL-SIR-80U-026)
HC A04/MF A01 CSCL 08L

Two cases of radar correlation with significant ice depolarization events accompanied by low copolarization fades of the 28.56 CHz COMSTAR beacon signal are described. The copol and cross polarization levels of the 28.56 GHz beacon signal were sequentially monitored. A nearby high resolution S band radar pointing along the Earth satellite path monitored the simultaneous ice and rain reflectivity. For the first case, excellent correlation is noted between the cross polarization events and relatively large and extended ice reflectivities along a segment of the Earth satellite path at altitudes near and above the 0 C isotherm. In the second case, the radar and receiver data strongly suggest the cross polarization mechanism is due to a hailshaft which intersects the path at altitudes well below the 0 C isotherm. Extracted depolarization signals were statistically characterized for the 1979 data base in terms of a cumulative distribution as well as monthly and time of day statistics under the given condition that the copol fade is less than 2 dB. SEASAT SAR PROCESSING AT THE NORWEGIAN DEFENCE RESEARCH ESTABLISHMENT
E. A. Herland *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 247-253 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

A digital processor which processes synthetic aperture radar (SAR) images from raw data gathered by a satellite platform is described. The basic principles of SAR are explained; the algorithms for the digital processor are given in terms of a block diagram, the different parts of which are considered separately. A routine for achieving automatic focusing in azimuth compression without satellite orbit information is discussed. Examples of imagery obtained by applying the algorithms to raw data from the Seasat-1 SAR system are shown. These indicate that it is possible to detect ships and that the system can be used for maritime surveillance purposes. Author (ESA)

THE REDUCTION, VERIFICATION AND INTERPRETATION OF MAGSAT MAGNETIC DATA OVER CANADA Progress Report
R. L. Coles, Principal Investigator, E Dawson, G. V. Haines, G. Jansen vanBeek, J. K Walker, and L. R. Newitt Jul. 1981 3 p Sponsored by NASA ERTS
(E82-10006; NASA-CR-164904; PR-3) Avail: NTIS HC A02/MF A01 CSCL 05B

Magnetic anomalies of lithospheric origin are weak at Magsat altitudes (20 to 30 nT at most), and are easily masked by much larger effects caused by field-aligned and other currents at high latitudes. Most of Canada lies under the influence of ionospheric currents in the auroral zone and polar cap. A more refined selection of quiet Magsat data allowed a revised scalar magnetic anomaly map of the whole region north of about 40 deg N latitude. Very preliminary vector anomaly maps and absolute vector component maps were derived. The scalar magnitudes show great promise for mapping the total force and anomaly fields. The Z vector data also appear to be good. The horizontal X and Y vector data are seriously contaminated with external fields and maybe other effects. A.R.H.

BIOLOGICAL PATCHINESS IN RELATION TO SATELLITE THERMAL IMAGERY AND ASSOCIATED CHEMICAL MESOSCALE FEATURES M.S. Thesis
Ronald Wayne Phoebus Jun. 1981 63 p refs
(AD-A105757) Avail: NTIS HC A04/MF A01 CSCL 08/1

The presence of biological patches, or communities, can have a direct effect on Naval operations, scientific research, and fisheries. It is shown that remote infrared satellite sensing may be used as a real-time tool to accurately locate thermally and biologically significant features. Several physical, chemical, and biological variables were sampled in the surface layer of mesoscale thermal features which were located using satellite imagery. The bio-chemical sampling produced replicate results from which the distribution of biomass could be inferred. Possible explanations are advanced for patch forming mechanisms and biomass distribution. Author (GRA)

Current cloud data obtained by operational environmental satellites was documented. Daily global satellite imagery is recorded in condensed form as a guide to data stored in the NOAA archives and is designed to help users select data for research and climatological use. The polar hemispheric mosaics reproduced in this catalog are derived from the advanced very high resolution radiometer (AVHRR (GSC)) data, and prepared daily by high speed computers. Visible and infrared swaths obtained while the satellite is northbound are used in the 15L mosaics from TIROS-N and the infrared channel only in the 17L mosaics from NOAA-6, NOAA-7 will include both the infrared and visible mosaics from the 14L pass. Infrared data swaths obtained during southbound passage of TIROS-N are labeled 03L, NOAA-6 are labeled 07L and NOAA-7 will be labeled 02L. GRA

INSTRUMENTATION AND SENSORS

Includes data acquisition and camera systems and remote sensors.

A82-10045 **Data compression and reconstruction for mixed resolution multispectral sensors.** R. A. Schowengerdt (Arizona, University, Tucson, AZ). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 318-328. 13 refs. Research supported by the U.S. Geological Survey.

A data compression technique that utilizes a mixture of spatial resolutions for a multispectral scanner is described. The complementary reconstruction procedure that extrapolates edge information from the high resolution band(s) to the low resolution bands is also discussed. Examples of Landsat MSS imagery that have been compressed and reconstructed to the original resolution are presented. Error rates are calculated for two types of scenes, one containing prominent topographic effects, the other of an agricultural area. Improvement in radiometric quality of up to 40% is achieved by application of the reconstruction procedure to the compressed data.

A82-10051 * **Absolute image registration for geosynchronous satellites.** R. Nankervis, D. Koch (NASA, Goddard Space Flight Center, Greenbelt, MD), H. Sielski (Computer Sciences Corp., Silver Spring, MD), and D. Hall (HRB Singer, Inc., State College, PA). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 438-446. 6 refs.

A procedure for the absolute registration of earth images acquired by cameras on geosynchronous satellites is described. A conventional least squares process is used to estimate navigational parameters and camera pointing biases from observed minus computed landmark line and element numbers. These estimated parameters along with orbit and attitude dynamic models are used to register images, employing an automated grey-level correlation technique, inside the span represented by the landmark data. Experimental results obtained from processing the SMS-2 observation data base covering May 2, 1979 through May 20, 1979 show registration accuracies with a standard deviation of less than two pixels if the registration is within the landmark data span. It is also found that accurate registration can be expected for images obtained up to 48 hours outside of the landmark data span. B.J.

A82-10858 **Orientation and construction of models. I - The orientation problem in close-range photogrammetry.** A. Okamoto (Kyoto University, Kyoto, Japan). *Photogrammetric Engineering and Remote Sensing,* vol. 47, Oct. 1981, p. 1437-1454. 14 refs.

The orientation problem of a stereoscopic pair of photographs taken with nonmetric cameras is considered, first algebraically and then geometrically. Also, some orientation techniques are presented. The orientation theory given here is quite fundamental and is applicable to various photogrammetric problems such as the calibration problem of nonmetric cameras and the orientation problem of stereo-strip imagery. In particular, one promising calibration method can be developed to provide interior orientation parameters for each of a stereoscopic pair of photographs, respectively, by using only distances in the object space as control. (Author)

A82-11406 **A mathematical model of an over-sea airborne UHF radio link.** T. Slator. *Marconi Review,* vol. 44, 2nd Quarter, 1981, p. 101-118. 9 refs.

A mathematical model is described which enables the performance of an over-the-sea airborne UHF radio link to be estimated as a function of terminal height and separation distance taking account statistically of variations of signal level caused by such factors as irregular antenna radiation patterns and a rough sea surface. (Author)

A82-11533 * **Radiative transfer theory for passive microwave remote sensing of random media.** S. L. Chuang and J. A. Kong (MIT, Cambridge, MA). In: Research topics in electromagnetic wave theory. New York, Wiley-Interscience, 1981, p. 136-160. 14 refs. NSF Grant No. ENG-78-23145; Grant No. NAG5-16; Contract No. F19628-80-C-0052.

The radiative transfer theory is applied to a random medium for the case of passive remote sensing. A general numerical solution with Gaussian quadrature method is studied. For a medium with laminar structure or a medium with cylindrical structure, closed form solutions are obtained by solving the radiative transfer equations of a two-layer random medium. Numerical results for the general case and the two limiting cases are compared. V.L.

A82-12127 * # **Repeatability and measurement uncertainty of the United States meteorological rocketsonde.** F. J. Schmidlin (NASA, Wallops Flight Center, Wallops Island, VA). *(International Symposium on Middle Atmosphere Dynamics and Transport, University of Illinois, Urbana, IL, July 28-Aug. 1, 1980.) Journal of Geophysical Research,* vol. 86, Oct. 20, 1981, p. 9599-9603. 11 refs.

It is pointed out that rocketsondes provide the only in situ 'ground truth' data for altitudes above 30 km. The need for precise temperature information has, therefore, led to a study of rocketsonde instrument repeatability and measurement uncertainty. Results obtained from root-mean-square difference and linear regression techniques are consistent and strongly suggest that the Datasonde precision is better than 1 C up to an altitude of 53 or 54 km. This result excludes atmospheric variability, which may occur within 5 min, and effects owing to spatial differences, which are small for paired measurements. At altitudes of 55 km and higher it is possible that sensor and flight-related anomalies, differences in radiation corrections owing to differing solar angles because of varying launch times, or even seasonal variations may create conditions that affect the magnitude of the standard corrections. G.R.

A82-12600 * **Airborne laser acquisition of cross-section data.** J. G. Collins (U.S. Army, Engineer Waterways Experiment Station, Vicksburg, MS) and W. B. Krabill (NASA, Wallops Flight Center, Wallops Island, VA). In: Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, Madison, WI, August 13, 14, 1980. New York, American Society of Civil Engineers, 1980, p. 175-181.

The feasibility of obtaining cross-section data from airborne remote sensing systems is investigated. Eleven test profiles in the Wolf River Basin, near Memphis, Tennessee, are selected. Each profile is characterized using conventional ground survey methods; under 'leaves-off' conditions, photogrammetric, airborne laser, and airborne radar data are obtained. Results indicate that valley profiles can be accurately characterized with an airborne laser system. C.R.

A82-13293 * **Intercalibration of Landsat 1-3 and NOAA 6 and 7 scanner data.** M. J. Duggin (New York, State University, Syracuse, NY). *Applied Optics,* vol. 20, Nov. 15, 1981, p. 3815, 3816. 14 refs. Contract No. JPL-916331.

A82-13547 **The influence of gravity waves on radiometric measurements - A case study.** M. T. Decker (NOAA, Wave Propagation Laboratory, Boulder, CO), F. Einaudi (Georgia Institute of Technology, Atlanta, GA), and J. J. Finnigan (Cooperative Institute for Research in Environmental Sciences, Boulder, CO; Commonwealth Scientific and Industrial Research Organization, Div. of Environmental Mechanics, Canberra, Australia). *Journal of Applied Meteorology,* vol. 20, Oct. 1981, p. 1231-1238. 26 refs.

During the 1978 PHOENIX experiment at the Boulder Atmospheric Observatory in Colorado, the presence of atmospheric gravity waves was detected by various independent remote sensing instruments. Fluctuations in the zenith atmospheric radiation were measured at 22.235 and 55.45 GHz in the water vapor and oxygen absorption bands and compared with corresponding fluctuations of surface pressure and the height of FM-CW radar echo returns. These fluctuations are explained, qualitatively and quantitatively, in terms of an internal gravity wave generated by wind shear above the boundary layer. The analysis shows that the oscillations at 22.235 GHz are essentially due to fluctuations of water vapor in the antenna beam while those at 55.45 GHz are due to temperature variations. (Author)

A82-13738 **Block adjustment with additional parameters.** F. Ackermann (Stuttgart, Universität, Stuttgart, West Germany).

Photogrammetria, vol. 36, Oct. 1981, p. 217-227. 25 refs.

The current status of the technique of systematic image error correction by block adjustment with additional parameters is reviewed. The technique, which has proven to be highly effective and widely applicable, is defined as based on the principle of aerial triangulation, with the parameters being additional unknowns, the magnitudes of which are estimated from observational data for a prefixed type of image deformation. Current research and development has centered on problems of the selection, reliability, determinability and statistical assessment of the additional parameters. Available results have shown that carefully applied additional parameters almost always give improved accuracy, depending on overlap, redundancy and control. The basic limitation of the method lies in the fact that additional parameters belong to the functional part of the mathematical adjustment model, and so are based on the erroneous assumption that image deformations are constant for a large group of photographs. S.C.S.

A82-14299 Characteristics of westward travelling surges during magnetospheric substorms. W. G. Tighe and G. Rostoker (Alberta, University, Edmonton, Canada). *Journal of Geophysics Zeitschrift für Geophysik,* vol. 50, no. 1, 1981, p. 51-67. 19 refs. Research supported by the Natural Sciences and Engineering Research Council of Canada.

Data from arrays of magnetometers along lines of constant magnetic latitude and longitude, supplemented with all-sky camera and riometer data, are used to study the temporal development and typical scale size of westward traveling surges which occur during magnetospheric substorms. It is found that the motion of the head of the surge can be quite irregular, and in extreme cases, the surge form may grow and decay in a confined longitudinal sector without any significant westward displacement. The positive D-component perturbation, the characteristic signature of a surge, is generally confined within a longitude range of 6-10 deg at about 70 deg N, and is believed to be generated by a filamentary southward ionospheric current flowing at the edge of the surge. A comprehensive model of the three-dimensional current system is presented by a detailed comparison of model and observed latitude and longitude profiles of the magnetic disturbance. It is found that the best agreement is obtained when the entire electrojet system flows from southeast to northwest relative to the lines of constant magnetic latitude. J.F.

A82-15039 * Availability of Seasat synthetic aperture radar imagery. B. Holt (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *Remote Sensing of Environment,* vol. 11, Nov. 1981, p. 413-417. NASA-supported research.

One of the sensors of the Seasat satellite was a synthetic aperture radar (SAR), which was operated over both oceanic and land areas. The Seasat SAR was an active imaging microwave system which transmitted and received horizontally polarized radiation at L-band frequency (1.275 GHz, 23-cm wavelength). Extensive coverage was obtained over North America, Europe, the Eastern Pacific Ocean, the Western and Northern Atlantic Ocean, and the Beaufort Sea. Surface coverage was also acquired over limited portions of Central America, the Gulf of Mexico, and the Caribbean Sea. The majority of the data has been optically processed in a so-called survey mode. Each optically processed Seasat pass has a swath width of 100 km at a scale of 1:500,000. A subset of the SAR data has been digitally processed in a so-called high-resolution mode. Digital processing has been performed upon selected scenes with dimensions of 100 x 100 km. Digitally processed imagery has a nominal ground resolution of 25 m. G.R.

A82-15655 † Current aerial cameras (Sovremennye aerofotoapparaty). V. G. Afremov and V. B. Il'in. *Geodeziia i Kartografiia,* Oct. 1981, p. 40-42. 6 refs. In Russian.

The paper considers the development and operation of the TE and TES aerial cameras, having focal distances of 350, 100, 70, and 50 mm and FOV angles of 40, 103, 120, and 136.5 deg, respectively, for 18 x 18 cm frames. The basic technical characteristics and some applications of these cameras are presented. B.J.

A82-15920 Three bearing method for passive triangulation in systems with unknown deterministic biases. M. Mangel and C. F. Carter (California, University, Davis, CA). *IEEE Transactions on Aerospace and Electronic Systems,* vol. AES-17, Nov. 1981, p. 814-819. 5 refs. Contract No. N00014-81-K-0030.

The paper presents an operationally simple method for triangulation in systems with strong biases, which requires three bearing measurements and two turns of the aircraft. The triangulation problem is considered in the search for a stationary target, in which deterministic and random terms enter into the observed bearing. Numerical and flight testing are reported, and it is shown how the method can be modified to include random fluctuation and confidence contours about the point of triangulation. D.L.G.

A82-15951 † Satellites of the Meteor series, intended for earth studies from space (Sputniki serii 'Meteor', prednaznachennye dlia izucheniia zemli iz kosmosa). Iu. V. Trifonov. *Issledovanie Zemli iz Kosmosa,* Sept.-Oct. 1981, p. 8-20. 8 refs. In Russian.

The objectives and main results of the Soviet experimental program for the operational study of the earth from space by means of Meteor satellites are presented. Examples of the effective use of multispectral wide-angle television data of low and medium resolution in the fields of geology, hydrology, weather modification, hydrometeorology, forestry, and navigation are given. The specific features of the Meteor program for remote sensing are described. The ballistic design of the experimental remote sensing system is characterized, indicating a sun-synchronous orbit for the system. The advantage of using a low-thrust electrojet engine in the Meteor program is discussed. J.F.

A82-15952 † Technical equipment of an experiment for remote sensing of the earth from space (Kompleks tekhnicheskikh sredstv eksperimenta po distantsionnomu zondirovaniiu zemli iz kosmosa). Iu. V. Trifonov. *Issledovanie Zemli iz Kosmosa,* Sept.-Oct. 1981, p. 21-27. In Russian.

The equipment used in an experiment (1980-1981) to obtain multispectral television data of medium and high resolution using a second-generation Meteor satellite is described. The prospects of developing a continuously active space system for earth resources studies are characterized. The design features and structural characteristics of the spacecraft used in the experiment are noted. These features include the improved accuracy of three-axis attitude control and stabilization of the angular velocity; structural and weight improvements, and the increased possibilities for automatic control in transmitting and receiving data. J.F.

A82-15955 † Experimental telemetry system based on the Fragment multispectral scanning system (Eksperimental'nyi informatsionno-izmeritel'nyi kompleks na osnove mnogozonal'noi skaniruiushchei sistemy 'Fragment'). G. A. Avanesov (Akademiia Nauk SSSR, Institut Kosmicheskikh Issledovanii, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* Sept.-Oct. 1981, p. 40-44. 8 refs. In Russian.

The structure and functions of the main system of the experimental telemetry complex, based on the Fragment multispectral scanning system are considered. A preliminary analysis of the results of an experiment involving the operational acquisition and machine processing of multispectral data is given. The system is shown to be useful for the development of operational methods of earth-resources study. J.F.

A82-15958 † Metrological support of measurements of earth-surface brightness by the Fragment multispectral scanning system (Metrologicheskoe obespechenie izmerenii iarkosti zemnoi poverkhnosti mnogozonal'noi skaniruiushchei sistemoi 'Fragment'). Tarnopol'skii (Akademiia Nauk SSSR, Institut Kosmicheskikh Issledovanii, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* Sept.-Oct. 1981, p. 65-77. 12 refs. In Russian.

A82-16164 The application of programmable pocket calculators for computations during survey flights. H. C. Zorn (International Institute for Aerial Survey and Earth Sciences, Enschede, Netherlands). *ITC Journal,* no. 3, 1981, p. 308-333.

Computation during survey flights can be effectively achieved using a programmable pocket calculator such as the Hewett-Packard C41 model. Using this calculator, formulas and programs have been developed for computing survey turns; wind star; heading and ground speed, given wind vector and required course; pressure altitude required to reach required true altitude; and true airspeed given indicated airspeed, air temperature, and pressure altitude. Other potential applications include the conversion of latitude and longitude to UTM zone and coordinates, and great circle and loxodrome computations. S.C.S.

A82-16447 * **Magnetic field observations on DE-A and -B.** W. H. Farthing, M. Sugiura, B. G. Ledley (NASA, Goddard Space Flight Center, Greenbelt, MD), and L. J. Cahill, Jr. (Minnesota, University, Minneapolis, MN). *Space Science Instrumentation,* vol. 5, Dec. 1981, p. 551-560. 14 refs.

Magnetic field observations are conducted on each of the DE-A and -B satellites by a triaxial fluxgate magnetometer. In the basic mode the instrumental resolution is + or - 1.5 nT; in addition, the DE-A magnetometer has two modes of higher resolution: + or - 0.25 nT and + or - 20 pT. The sampling rate is 16 vector samples per second in all modes. The experiment objectives include observations of field-aligned currents, magnetospheric equatorial currents, and ULF waves. These observations, taking full advantage of the specifically selected orbits of the two spacecraft and of the unique combination of instruments, are performed to achieve a better understanding of the electrodynamic coupling within the atmosphere-ionosphere-magnetosphere system and of wave-particle interactions which contribute to the coupling processes. (Author)

A82-16602 † **Main results of the Raduga experiment (Osnovnye itogi eksperimenta 'Raduga').** Ia. L. Ziman, Iu. M. Chesnokov, and V. V. Aksenov. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 5-13. In Russian.

The Raduga experiment, involving the multispectral photography of earth resources from Soyuz-22, is described. Attention is given to the preflight testing and calibration of the multispectral cameras, the operational characteristics of the equipment, results of photointerpretation, and the success with which the goals of the experiment were carried out. It has been concluded that the MKF-6 and MSP-4 multispectral instrumentation is suitable for practical implementation in the remote sensing of earth resources. B.J.

A82-16613 † **Methodology and practice of spectroscopic measurements of landscape elements in the preparation and carrying out of down-looking experiments (Metodika i praktika spektrometricheskikh izmerenii elementov landshafta pri obespechenii i provedenii podsputnikovykh eksperimentov).** G. B. Gonin, A. A. Bartashevich, N. V. Kravchuk, N. N. Mozgov, and Iu. V. Ponomarenko. In: Airborne and spaceborne multispectral photography of the earth. Moscow, Izdatel'stvo Nauka, 1981, p. 118-128. 7 refs. In Russian.

Various aspects concerning the preparation and carrying out of down-looking experiments associated with multispectral scanning of landscape elements are considered. Particular consideration is given to the mathematical modeling of the earth-atmosphere system (with allowance for the scattering and turbulence properties of the atmosphere), and to calibration specifications in aerial spectroscopy experiments. B.J.

A82-17165 * **Global satellite measurements of water vapour, wind speed and wave height.** D. B. Chelton, K. J. Hussey, and M. E. Parke (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *Nature,* vol. 294, Dec. 10, 1981, p. 529-532. 6 refs. NASA-supported research.

The results of global measurements of atmospheric water vapor by the Seasat Scanning Multichannel Microwave Radiometer and wave height and wind speed by the Seasat altimeter (ALT) are reported. The 13.5 GHz ALT has a 3.125 ns pulsewidth and 1022 Hz repetition rate, and measures surface height to a resolution exceeding 10 cm celative to a reference ellipsoid. Full ALT data comprise 135 km equatorial groundtracks, with about a 50 cm difference of sea wave height compared to buoy reference measurements, and wind-speed accuracy to within 0.25-1.58 m/sec up to 20 m/sec. Highest water vapor concentrations were observed in the tropics and the lowest at high latitudes. Wind speeds were highest for the north-east and south-east tradewinds in both the Atlantic and Pacific oceans. Average wave height is small in the summer North Hemisphere and the largest waves are in the winter Southern ocean, and lowest in western Atlantic and Pacific ocean areas where winds are lightest. D.H.K.

A82-17918 # **User needs and the future of operational meteorological satellites.** D. B. Miller and J. R. Silverman (NOAA, Advanced Systems Concepts Group, Washington, DC). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0388.* 9 p.

Applications of the TIROS-N and GOES satellites are reviewed, and requirements for the next generation of meteorological satellites are discussed. TIROS N spacecraft were a joint effort of the U.S., U.K., and France, and carried instrumentation which provided information on oceanographic and hydrologic processes, agricultural products, meteorology, and digital imaging. The GOES satellites give continuous viewing of weather features and collect and relay meteorological data from remote platforms such as buoys, ships, stations, aircraft, and balloons. The next generation of GOES spacecraft are also intended for GEO, and instruments will provide imaging in the IR and visual with 1-2 and 0.5 km resolution, respectively, multispectral imaging, vertical temperature resolution in the troposphere to 1-5 km, and have solar X ray sensing capabilities, as well as for the atmospheric electron density. Further instrumentation additions and choice of orbits are examined, noting that a careful consideration of the capital return on investment will be required before any decision to fly new meteorological spacecraft. DISTORTION-FREE MAPPING OF VISSR IMAGERY DATA FROM GEOSYNCHRONOUS SATELLITES
F. K. Chan *In* NASA. Goddard Space Flight Center Sixth Ann. Flight Mech./Estimation Theory Symp. Oct. 1981 35 p ref
(Contracts NOAA-01-8-MO1-1864; NOAA-NA79-KA-C-00026)
Avail: NTIS HC A13/MF A01 CSCL 22A

The formulation is rigorous and includes all misalignment angles of the VISSR, the sun sensor and the instantaneous spin axis with the satellite's body axis. It also includes the effects due to the motion of the satellite's suborbital point. All the mapping equations for distortion removal were reduced to simplest forms, and all the algorithms were optimized as much as possible. An approach was then formulated for implementing these algorithms for in-line operational use. It is concluded that in-line distortion removal is possible in real-time processing of infra-red but not visible VISSR imagery data. T.M.

THE MSS CONTROL POINT LOCATION ERROR FILTER FOR LANDSAT-D
I. Levine *In* NASA. Goddard Space Flight Center Sixth Ann. Flight Mech./Estimation Theory Symp. Oct. 1981 18 p refs

(Contract NAS5-25300)
Avail: NTIS HC A13/MF A01 CSCL 05B

The filter produces the maximum likelihood estimates for average values of the spacecraft position and attitude errors during a single scene. The quality of the filter performance is characterized by the maximal cross and along track residual errors for which probability distributions can be calculated analytically for a given pattern of control points. The filter with an automatic selection of the best set of estimates provides geodetic correction at 90% of pixels with residual errors less than 40 m for four or more control points and the mean squared measurement errors of the order of 20-25 m. The same accuracy can be preserved for eight or more control points and measurement errors of 30-35 m. T.M.

MAGSAT: VECTOR MAGNETOMETER ABSOLUTE SENSOR ALIGNMENT DETERMINATION
M. H. Acuna Sep. 1981 39 p refs
(NASA-TM-79648) Avail: NTIS HC A03/MF A01 CSCL 14B

A procedure is described for accurately determining the absolute alignment of the magnetic axes of a triaxial magnetometer sensor with respect to an external, fixed, reference coordinate system. The method does not require that the magnetic field vector orientation, as generated by a triaxial calibration coil system, be known to better than a few degrees from its true position, and minimizes the number of positions through which a sensor assembly must be rotated to obtain a solution. Computer simulations show that accuracies of better than 0.4 seconds of arc can be achieved under typical test conditions associated with existing magnetic test facilities. The basic approach is similar in nature to that presented by McPherron and Snare (1978) except that only three sensor positions are required and the system of equations to be solved is considerably simplified. Applications of the method to the case of the MAGSAT Vector Magnetometer are presented and the problems encountered discussed. A.R.H.

A SWEDISH PROPOSAL FOR AN EISCAT/GEOS-2 EXPERIMENT
Svante Westerlund, Georg Gustafsson, Aake Steen, John Murdin, Gudmund Wannberg, Rolf Bostroem (Uppasala Ionospheric Obs., Sweden), Aake Hedberg (Uppsala Ionospheric Obs., Sweden), Hermann Opgenoorth (Uppsala Ionospheric Obs., Sweden), Erling Nielsen (Max-Planck Inst. fuer Aeronomie, Katlenburg-Lindau, West Germany), Carl-Gunne Faelthammar (Royal Inst. of Technol., Stockholm) et al Mar. 1981 28 p refs
(KGI-175; ISSN-0347-6405) Avail: NTIS HC A03/MF A01

An experiment that uses GEOS to measure in the equatorial plane at the same time as EISCAT and other ground based instrumentation are monitoring the ionosphere is described. The generation, acceleration and loss of auroral particles are studied. Signatures of particle precipitation in the ionosphere and properties of the plasma and electric field in the equatorial plane are correlated. The position of the conjugate point of GEOS is determined during various conditions. Such data in conjunction with magnetic field models, make it feasible to identify and estimate the various effects that contribute to the field during disturbances, i.e. to improve geomagnetic field models. IONOSPHERIC PROPAGATION CORRECTION MODELING FOR SATELLITE ALTIMETERS
George Nesterczuk Nov. 1981 14 p refs
(Contract NAS6-3075)
(NASA-CR-156881) Avail: NTIS HC A02/MF A01 CSCL 20D

The theoretical basis and avaliable accuracy verifications were reviewed and compared for ionospheric correction procedures based on a global ionospheric model driven by solar flux, and a technique in which measured electron content (using Faraday rotation measurements) for one path is mapped into corrections for a hemisphere. For these two techniques, RMS errors for correcting satellite altimeters data (at 14 GHz) are estimated to be 12 cm and 3 cm, respectively. On the basis of global accuracy and reliability after implementation, the solar flux model is recommended. Author

An aerial vehicle rotating in gyroscopic fashion about one of its axes has an optical system which scans an area below the vehicle in determined relation to vehicle rotation. A sensing device is provided to sense the physical condition of the area of scan and optical means are associated to direct the physical intelligence received from the scan area to the sensing means. Means are provided to incrementally move the optical means through a series of steps to effect sequential line scan of the area being viewed keyed to the rotational rate of the vehicle.

INFRARED RADIANCE MODEL VARIATION BY SENSOR FLIGHT MEASUREMENTS
R. BaldessiniFontana, D. Sciacovelli (ESTEC, Noordwijk, Netherlands), and L. Fraiture (ESOC, Darmstadt, West Germany) *In* ESA Spacecraft Flight Dyn. Aug. 1981 p 461-478 refs

Avail: NTIS HC A22/MF A01; ESA, Paris FF 160 Member States, AU, CN and NO (+20% others)

The NASA and BAC-ESR 4 IR radiance models of Earth, applied to attitude sensor calibration, are compared. The sensors are IR pencil beams on spinning satellites. Flight measurements of Geos 2 and OTS transfer orbits were compared to simulations from a model which describes the optics, detector and electronics of the beam, based on directly measured parameters and laboratory test data. The models performed equally well. It is shown that anomalies in preflight calibration can be detected. A small mismatch of the optical axis inclination of a Geos 2 IR telescope was observed. STATE-OF-THE-ART IN USING A SPACEBORNE ALTIMETER AND SCATTEROMETER FOR THE DETERMINATION OF WIND, SEA STATE, AND MARINE AND ICE DYNAMICS
M. Lefebvre and J.-L. Hyacinthe (Centre National pour l'Exploitation des Oceans, Paris) *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 57-58

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

The accuracy of Seasat altimeter and scatterometer data is discussed. Sea state obtained through altimeter pulse shape and wind data obtained by altimeter pulse amplitude or, with direction by the scatterometer backscatter, are compared with model and map values. The altimeter performs well, but not the scatterometer. Altimeter data can be used to investigate marine and ice dynamics on a large scale, e.g., a sea. For seasonal and interannual fluctuation of oceanic circulation, a few cm accuracy on the relative satellite trajectory without geoid accuracy is needed. For the mean ocean circulation and the absolute determination of current, a 10 cm accurate geoid is needed. Author (ESA)

N82-14563# Canada Centre for Remote Sensing, Ottawa (Ontario).

A RECOMMENDED SENSOR PACKAGE FOR THE DETECTION AND TRACKING OF OIL SPILLS

H. H. Zwick, R. A. Neville, and R. A. ONeil *In* ESA Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 77-88 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Oil on open water under clear skies is a relatively easy target, oil under ice is very difficult. Results of remote sensing experiments acquiring data for system specification are discussed. Instruments assessed include active microwave sensors for the measurement of backscatter from oil slicks, scanners for oil thickness determination from the spectral character of reflected radiation and solar heating effects, and laser fluorosensors for oil-specific detection in oil and water and/or ice mixtures and for Raman scattering from the surface. The most effective system for the wide variety of conditions experienced in Canada consists of a laser fluorosensor, an ultraviolet/infrared line scanner, a side-looking airborne radar, low light level television and photographic cameras. These sensors are supported by real time data annotation, display, and analysis systems. Author (ESA)

GEM: A SIMPLE METEOROLOGICAL BUOY WITH SATELLITE TELEMETRY

R. Michael Reynolds *In* ESA Nowcasting: Mesoscale Observations and Short-Range Prediction Jun. 1981 p 401-404 refs

Avail: NTIS HC A19/MF A01; ESA, Paris FF 160 Member States, AU, CN and NO (+20% others)

A small, easily deployable and inexpensive buoy was developed for mesoscale research. The synthesis of the detailed parameter fields necessary for mesometeorology necessitates the deployment of a network of buoys that are less expensive than most standard designs. Vector averaged winds, scaler winds, air temperature, water temperature, and gusts are measured. Compass readings provide surface current direction. The buoy transmits data via the GOES satellite which eliminates the need for internal tape recording. Computer processing of the data is described. Proper counterbalancing and vector averaging are shown to reduce the effects of buoy motion. Author (ESA)

METEOROLOGICAL SATELLITES

16 Oct. 1981 7 p refs Transl. into ENGLISH from Skrzydlata Polska (Poland) no. 27, 1979 21 p

(AD-A107427; FTD-ID(RS)T-1059-81) Avail: NTIS HC A02/MF A01 CSCL 22B

Meteor-2 (second generation meteorological satellite) and an experimental satellite on which instruments are being tested and modified for the requirements of hydrometeorology and a determination of natural resources are presently operational in the U.S.S.R. Television devices with a 1-10 km terrain image resolution operating in the visible and infrared region are used to determine the space system, velocity and direction of cloud movements and provide information about the snow and ice cover, cyclones, storms, vortices in the atmosphere, and velocity and direction of wind. Images with a 50-1000 m resolution make possible geological and hydrological surveys, an evaluation of the state of vegetation and crops, detection of forest fires, determination of pollution of the atmosphere and sea and determination of optimal fishing regions in the ocean. Measurement of the intensity of atmospheric radiation in narrow infrared regions and very high frequencies allows remote evaluation of the temperature and humidity distribution in the vertical cross section of the Earth's atmosphere. ERSYS-SPP ACCESS METHOD SUBSYSTEM DESIGN SPECIFICATION

R. C. Weise, Principal Investigator Sep. 1980 74 p Sponsored by NASA, USDA, Dept. of Commerce, Dept. of Interior, and Agency for International Development ERTS

(Contract NAS9-14350; Proj. AgRISTARS)

(E82-10015; NASA-CR-161039; MU-11-00300; JSC-16918)

Avail: NTIS HC A04/MF A01 CSCL 02C

The STARAN special purpose processor (SPP) is a machine allowing the same operation to be performed on up to 512 different data elements simultaneously. In the ERSYS system, it is to be attached to a 4341 plug compatible machine (PCM) to do certain existing algorithms and, at a later date, to perform other to be specified algorithms. That part of the interface between the 4341 PCM and the SPP located in the 4341 PCM is known as the SPP access method (SPPAM). Access to the SPPAM will be obtained by use of the NQUEUE and DQUEUE commands. The subsystem design specification is to incorporate all applicable design considerations from the ERSYS system design specification and the Level B requirements documents relating to the SPPAM. It is intended as a basis for the preliminary design review and will expand into the subsystem detailed design specification. Author

ADDITIONAL STUDIES OF EARTH RESOURCES SYNTHETIC APERTURE RADAR PAYLOADS Final Report
A. P. Luscombe Paris ESA Oct. 1980 105 p refs
(Contract ESA-6225/80-F-CG(SC))
(MTR-80/90; ESA-CR(P)-1469) Avail: NTIS HC A06/MF A01

Results of design studies on the synthetic aperture radar payload are discussed. A new baseline system for an incidence angle of about 45 deg was specified, and its performance at smaller angles is assessed. A feasibility study of a squinted SAR system is described. For individual titles, see N82-15501 through N82-15502.

NEW BASELINE SYSTEM Final Report
In its Additional Studies of Earth Resources Syn. Aperture Radar Payload Oct. 1980 46 p refs

Avail: NTIS HC A06/MF A01

A baseline system with an incidence angle of around 45 deg was specified for the Earth resources SAR payload and its operation at smaller angles was investigated. The basic system design and method of analysis are described. The choices of pulse repetition frequency (PRF) for different incidence angles, the problem of ambiguities and their evaluation and the antenna beam patterns are covered along with the selection of major system parameters (beam pattern, PRF's and incidence angles). The detail and the baseline system suggested is analyzed in terms of the image quality specifications. Two more aspects of the SAR system, the transmitter power requirements and the variation in ground range resolution with incidence angle, are discussed. A listing of the basic results for four different incidence angles is given. J.M.S.

GENERAL

Includes economic analysis.

A82-12530 **Remote sensing contributions to the management of renewable resources.** C. Sheffield (Earth Satellite Corp., Washington, DC). In: The year of the Shuttle; Proceedings of the Eighteenth Space Congress, Cocoa Beach, FL, April 29-May 1, 1981. Cocoa Beach, FL, Canaveral Council of Technical Societies, 1981, p. 2-7 to 2-14. 9 refs.

Present and future contributions of space-derived remotely sensed data, obtained from observations of five major areas of renewable resources, are discussed. The data needs for the five resource areas - agriculture, forestry, rangeland management, coastal zones, and the ocean harvest - are described, and the principal satellites and sensors flown in space to cover these areas since 1972 are presented. Data sources and data needs are compared, and areas of data deficiency and limitation are identified. A profile of earth sensing satellites to fill these gaps in a 1985-1995 time frame is given. Cooperative international efforts to develop future earth resource satellites are suggested. J.F.

A82-12541 **The 1981 RCA space constellation.** A. Schnapf (RCA, Astro-Electronics Div., Princeton, NJ). In: The year of the Shuttle; Proceedings of the Eighteenth Space Congress, Cocoa Beach, FL, April 29-May 1, 1981. Cocoa Beach, FL, Canaveral Council of Technical Societies, 1981, p. 5-43 to 5-53.

The eight spacecraft scheduled for launch in 1981 are described. These are the RCA Satcom D and E commercial communication satellites, the U.S. Navy NOVA 1 and 2 navigation satellites, NASA's Dynamics Explorer A and B scientific satellites, the U.S. Department of Commerce NOAA-C operational meteorological satellite, and the Department of Defense DMSP Block 5D-2 operational meteorological satellite. It is noted that in addition a number of RCA color television camera systems will be carried on the Space Transportation System for aiding the astronauts in inspecting and deploying cargo from the cargo bay and for providing video transmissions of engineering and public relations activity in the Shuttle crew compartment. C.R.

A82-17307 # **ISRO satellite mission support facilities - Scope and future plans.** M. K. Sundararaman, V. S. Iyengar, and K. V. Venkatachary (Indian Space Research Organization, Sriharikota, India). In: Space tracking and data systems; Proceedings of the Symposium, Arlington, VA, June 16-18, 1981. New York, American Institute of Aeronautics and Astronautics, 1981, p. 51-63.

It is the objective of the Indian Space Research Organization (ISRO) to provide communication and education to widely dispersed rural communities in India, and to survey and manage the country's natural resources with the aid of satellite technology. India maintains also a modest scientific research program which employs satellite missions. A brief overview is provided of the Indian space program, giving attention to the network's current capabilities for satellite data acquisition, tracking activities, and data dissemination. A description is given of plans for the coming decade. G.R.

REPORT ON ACTIVE AND PLANNED SPACECRAFT AND EXPERIMENTS
Robert W. Vostreys, ed. and Harriet H. Maitson, ed. Aug. 1981 310 p refs
(NASA-TM-84025; NSSDC/WDC-A-R&S-81-10) Avail: NTIS HC A14/MF A01 CSCL 22A

Active and planned spacecraft activity and experiments between June 1, 1980 and May 31, 1981 known to the National Space Science Data Center are described. The information covers a wide range of disciplines: astronomy, Earth sciences, meteorology, planetary sciences, aeronomy, particles and fields, solar physics, life sciences, and material sciences. Each spacecraft and experiment is described and its current status presented. Descriptions of navigational and communications satellites and of spacecraft that contain only continuous radio beacons used for ionospheric studies are specifically excluded. J.D.H.

MISSION OPERATION REPORT: OSTA-1
26 Oct. 1981 28 p
(NASA-TM-84053; S-420-81-01) Avail: NTIS HC A03/MF A01 CSCL 22B

The Office of Space and Terrestrial Applications (OSTA 1) payload was designed to demonstrate shuttle's capability as a space research platform and the potential application of techniques for future remote sensing. Because thermal tests planned for STS-2 flight require that the payload bay to be pointed towards Earth, the experiments selected for OSTA 1 emphasize terrestrial sciences and are concerned with remote sensing for Earth resources, environmental quality, ocean conditions, meteorological phenomena, and life sciences. Characteristics of the STS-2 flight, the major events timeline, geopgraphical areas coverage, pallet experiments ground coverages, and experiment operating modes are described. The OSTA-1 pallet configuration, payload interface, and the instruments comprising each of the experiments are described and illustrated. Mission support stations, and the payload team are listed. Mission cost data are included. A.R.H.

OVERALL ECONOMIC IMPACT OF AN OPERATIONAL METEOSAT SYSTEM Final Report
J. B. Lagarde, P. Brendle (BETA/ULP), C. Miller, and P. Cohendet (BETA/ULP) Paris ESA Jan. 1981 70 p refs
(Contract ESA-4421/80/F-FC(SC))
(ESA-CR(P)-1457) Avail: NTIS HC A04/MF A01

The METEOSAT concept through its development and well into its expected operational mode, up to 1990 was analyzed. Account was taken of the disturbance introduced by the METEOSAT 1 failure in November 1979, of the delay in the launch of METEOSAT 2, and of the uncertainties arising from the lack of decision, at the end of 1980, on the operational METEOSAT follow-on. Results show important positive economic effects both for the users community (direct benefits) and for the contracting industry concerned (induced benefits). Author (ESA)

THE NEED FOR INTEGRATED OFF-SHORE, REAL-TIME INFORMATION AND MANAGEMENT SYSTEMS
L. W. Morley *In its* Appl. of Remote Sensing Data on the Continental Shelf Jul. 1981 p 17-21 refs

Avail: NTIS HC A13/MF A01; ESA, Paris FF 125

Integrated planning, in which data from ships, aircraft, data buoys, and shore or satellite-borne radar are used for ocean surveillance is urged. The Atlantic coast of Canada is used as an example of the inefficiency of current management methods. Traffic control, search and rescue missions, pollution control, weather forecasting, and fisheries management are directed by separate government agencies, each with its own information system. A coordinated approach would reduce waste and allow full advantage to be taken of technological developments, e.g., satellites, unknown when the agencies were created. Author (ESA)

STUDY OF A COMBINED SATELLITE SYSTEM FOR REMOTE SENSING AND EARTH-ORIENTED RESEARCH (LOCSS) Final Report, Jul. 1980
HansJuergen Guenther, Wolfgang Gericke, Hansjoerg Klotz, Rainer Krieger, Birgit Metzgar, Joachim Nauck, Klaus Plate, Rudolf Rohr, Gernot Schmidt, and Gerhard Schneider Bonn Bundesministerium fuer Forschung und Technologie Jan. 1981 222 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-81-002; ISSN-0170-1339) Avail: NTIS HC A10/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 38.60

The suitability of three European satellite platforms (ERDSAT, SPAS, SPOT) for a combined satellite system (remote sensing and Earth-oriented research) is discussed. The system consists of two Sun-synchronous orbiting satellites with a combined remote sensing and Earth-oriented research payload and of a pure climatography satellite on a drift orbit. All platforms can accommodate the basic payload, but SPAS offers some advantages and is the only platform able to accommodate the extended payload. The combined three-satellite system offers cost advantages over the four-satellite system only if the space shuttle is used as launcher. Hence, SPAS should be given preference over the other platforms for such a system. The subsystem design is presented and problem areas are discussed. Data acquisition and data processing of image and climatic data are the bottlenecks in existing systems. Author (ESA)

CIVIL LAND REMOTE SENSING SYSTEMS

Washington GPO 1981 370 p Joint hearings before the Subcomm. on Space Sci. and Appl. of the Comm. on Sci. and Technol. and the Subcomm. on Sci., Technol., and Space of the Comm. on Com., Sci., and Transportation, 97th Congr., 1st Sess., No. 40, 22-23 Jul. 1981
(GPO-35-265) Avail: Subcommittee on Space Science and Applications

Steps taken to facilitate NOAA assumption of responsibility for operating LANDSAT D and LANDSAT D prime are reviewed and institutional alternatives for transferring operational responsibility for the program to the private sector are examined. These include: (1) an existing private corporation; (2) a legislatively established for profit private corporation; (3) a government corporation; and (4) Federal agency ownership with private sector operation. The advantages and disadvantages of each of these options are considered as well as user participation. A.R.H.

ANALYSIS OF SATELLITE OBSERVATIONS: THEORETICAL STUDIES ON THE SAMPLING PROBLEM [ANALYSE VON SATELLITENBEOBACHTUNGEN - THEORETISCHE UNTERSUCHUNGEN ZUM SAMPLING PROBLEM]

Hans Joachim Preuss 1981 68 p refs In GERMAN; ENGLISH summary
(Mitt-31; ISSN-0069-5882) Avail: NTIS HC A04/MF A01

In a general mission analysis, some orbital and measuring characteristics are simulated and their influence on the sampling investigated. The important role of a satellite with a moderate inclination (approximately 60 deg) is shown; with the drifting orbit homogeneous sampling of diurnal variations and of radiance distributions is possible in a global scale within about 15 days. More complex scan modes (off track, rotary or conical) may improve the angular sampling, especially in case of Sun synchronous satellites, but for studies in small temporal and spatial scales a system with at least three satellites is necessary. The general results are applied on the determination of the radiation balance. By means of models for the diurnal variations and anisotropic behavior, measurements are created and sampling errors demonstrated. Author

TITLE
REPORT NUMBER
PAGE NUMBER
ACCESSION NUMBER

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section (of this supplement). If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

CHESAPEAKE BAY (US)

Chesapeake Bay Plume Study: Superflux 1980
[NASA-CP-2188] p0026 N82-10661

Superflux I, II, and III experiment design: Remote sensing aspects p0027 N82-10664

Superflux I, II, and III experiment designs: Water sampling and analyses --- Chespeake Bay, environmental monitoring and remote sensing p0027 N82-10665

Monitoring the Chesapeake Bay using satellite data for Superflux III p0027 N82-10668

Remote sensing of the Chesapeake Bay plume salinity via microwave radiometry p0027 N82-10670

Preliminary analysis of ocean color scanner data from Superflux III p0027 N82-10672

Analysis of testbed airborne multispectral scanner data from Superflux II --- Chesapeake Bay plume and James Shelf data p0027 N82-10682

Application of the NASA airborne oceanographic lidar to the mapping of chlorophyll and other organic pigments p0027 N82-10684

Assessment of Superflux relative to remote sensing --- airborne remote sensing of the Chesapeake Bay plume and shelf regions p0028 N82-10694

CHILE

Global Tectonics: Some Geologic analyses of observations and photographs from Skylab p0020 N82-12494

CHLOROPHYLLS

Synoptic thermal and oceanographic parameter distributions in the New York Bight Apex p0023 A82-12885

Remote sensing of benthic microalgal biomass with a tower-mounted multispectral scanner p0024 A82-15031

Temporal relationships between spectral response and agronomic variables of a corn canopy p0002 A82-15038

Role of remote sensing in the study of acid rain impact on aquatic systems
[AIAA PAPER 82-0336] p0036 A82-17892

Application of the NASA airborne oceanographic lidar to the mapping of chlorophyll and other organic pigments p0027 N82-10684

Assessment of Superflux relative to remote sensing --- airborne remote sensing of the Chesapeake Bay plume and shelf regions p0028 N82-10694

Development of the coastal zone color scanner for NIMBUS 7. Volume 1: Mission objectives and instrument description
[NASA-CR-166720-VOL-1] p0028 N82-11511

The color of the sea and its relation to surface chlorophyll and depth of the euphotic zone p0030 N82-14562

Coastal zone research using remote sensing techniques --- calibration of coastal zone color scanner p0031 N82-14571

Recent work in passive optical imaging of water --- space and aircraft derived data p0038 N82-14575

The feasibility of using remotely sensed color as an index of Irish coastal water properties --- statistical correlation of sea truth data p0032 N82-14581

Necessity of remote sensing for ocean studies. Part 1: Northwest African missions, Sahara-1 and Atlor-1 --- sea truth/remote sensing correlation of offshore upwelling p0032 N82-14582

CITIES

Cultural features imaged and observed from Skylab 4 p0010 N82-12499

CLASSIFICATIONS

Phytoecozonation of Sevier Lake region of Utah using digitized Landsat MSS data p0001 A82-10042

An improvement in land cover classification achieved by merging microwave data with Landsat multispectral scanner data p0007 A82-10043

Spectrometric studies of the earth's surface p0043 A82-16612

The maximum mean accuracy of classification of remote-sensing objects and the influence on this accuracy of data acquisition and processing methods p0044 A82-16615

Fiscal year 1980-81 implementation plan in support of technical development and integration of sampling and aggregation procedures --- crop acreage estimation
[E82-10013] p0005 N82-15491

CLIMATOLOGY

Upper tropospheric cyclonic vortices in the tropical South Atlantic p0009 A82-16325

CTD/02 measurements during the Equatorial Pacific Ocean Climate Study (EPOCS) in 1979
[PB81-211203] p0026 N82-10461

Study on satellite radar altimetry in climatological and oceanographic research, volume 1
[SP/153/06/01/FR(80)-VOL-1] p0026 N82-10486

Study on satellite radar altimetry in climatological and oceanographic research, volume 2
[SP/153/06/01FR(80)-VOL-2] p0026 N82-10487

Geophysical monitoring for climatic change, number 8: Summary Report, 1979
[PB81-233355] p0012 N82-13631

Environmental satellite imagery, March 1981
[PB81-248049] p0047 N82-15698

CLOUD COVER

The near-infrared radiation received by satellites from clouds p0025 A82-17492

CLOUD PHOTOGRAPHY

An investigation of a polar low with a spiral cloud structure p0007 A82-10616

Meteorological lab applications of Skylab handheld-camera photographs p0011 N82-12506

Some aspects of tropical storm structure revealed by handheld-camera photographs from space p0011 N82-12507

Mesoscale wake clouds in Skylab photographs p0011 N82-12508

Mesoscale cloud features observed from Skylab p0011 N82-12509

CLOUDS

Limit on remote FTIR detection of trace gases
[AD-A104842] p0011 N82-12511

COASTAL CURRENTS

Operational use of remote sensing for coastal zone management and possible contribution of specialized satellites --- aerial photography p0031 N82-14574

Mapping of surface currents in Greenland fiords by means of LANDSAT images --- multispectral photography p0038 N82-14579

Necessity of remote sensing for ocean studies. Part 1: Northwest African missions, Sahara-1 and Atlor-1 --- sea truth/remote sensing correlation of offshore upwelling p0032 N82-14582

COASTAL ECOLOGY

Data sources for analyses of Great Lakes wetlands p0035 A82-10054

A marine environmental monitoring and assessment program p0027 N82-10663

A method for using aerial photos in delineating historic patterns of beach accretion and retreat
[PB81-223836] p0010 N82-11536

Requirements in pollution monitoring and coastal management p0030 N82-14558

Studies of the Indian continental shelf: Application of remote sensing data p0031 N82-14569

Operational use of remote sensing for coastal zone management and possible contribution of specialized satellites --- aerial photography p0031 N82-14574

COASTAL WATER

Satellite imagery and shoreline erosion prediction p0036 A82-12595

Clear water radiances for atmospheric correction of coastal zone color scanner imagery p0025 A82-17292

The use of satellite infrared imagery for describing ocean processes in relation to spawning of the northern anchovy /Engraulis mordax/ p0025 A82-17565

An inertially-aided aircraft track recovery system for coastal mapping p0037 A82-18166

The ice-conditions in the Greenland waters, 1965. Coastal maps
[ISBN-87-7478-183-9] p0026 N82-10467

Analysis of testbed airborne multispectral scanner data from Superflux II --- Chesapeake Bay plume and James Shelf data p0027 N82-10682

The need for integrated off-shore, real-time information and management systems p0055 N82-14555

The color of the sea and its relation to surface chlorophyll and depth of the euphotic zone p0030 N82-14562

SPOT data simulations: Littoral applications p0046 N82-14568

A short review of an oceanographic use of Meteosat data by the ORSTOM remote sensing service p0031 N82-14570

Coastal zone research using remote sensing techniques --- calibration of coastal zone color scanner p0031 N82-14571

Marine activities in Sweden for which remote sensing data may be of interest --- oceanography, weather forecasting, and analysis p0031 N82-14576

Airborne remote sensing of the coastal zone p0053 N82-14577

The use of LANDSAT MSS to observe sediment distribution and movement in the Solent coastal area --- multispectral scannel (MSS) p0038 N82-14580

The feasibility of using remotely sensed color as an index of Irish coastal water properties --- statistical correlation of sea truth data p0032 N82-14581

Use of Side Looking Airborne Radar (SLAR) for oil pollution monitoring in Norway p0012 N82-14588

COASTAL ZONE COLOR SCANNER

Clear water radiances for atmospheric correction of coastal zone color scanner imagery p0025 A82-17292

Development of the coastal zone color scanner for NIMBUS 7. Volume 1: Mission objectives and instrument description
[NASA-CR-166720-VOL-1] p0028 N82-11511

Coastal zone research using remote sensing techniques --- calibration of coastal zone color scanner p0031 N82-14571

COASTS

Remote sensing contributions to the management of renewable resources p0055 A82-12530

Development of a coastal relief of the Gulf of Riga, based on results of an analysis of space images p0024 A82-15962

Application of remote sensing data on the continental shelf: Proceedings of an EARsL-ESA Symposium
[ESA-SP-167] p0029 N82-14553

COLOR CODING

Spectral correlation filters and natural colour coding p0043 A82-16160

COLOR INFRARED PHOTOGRAPHY

Areawide soil loss predictions using CIR airphotos p0007 A82-12591

COLOR TELEVISION

The 1981 RCA space constellation p0055 A82-12541

COLORADO

Preliminary results of mapping urban land cover with Seasat SAR imagery p0007 A82-10044

COLORADO PLATEAU (US)

Morphostructural analyses of space imagery in the central Colorado Plateau p0019 N82-10465

Geological features of southwestern North America p0020 N82-12495

COMPUTER GRAPHICS

Digital image technology - MC&G impact --- Mapping, Charting, & Geodesy p0015 A82-10028

Applications of digital displays in photointerpretation and digital mapping p0041 A82-10038

Digitizing and automated output mapping errors p0015 A82-10859

Interactive techniques for estimating precipitation from GOES imagery p0041 A82-13121

Small-scale terrain mapping based on numerical interpretation of LANDSAT imagery
[VTT-40] p0045 N82-10485

COMPUTER PROGRAMS

Compensation of systematic errors in bundle adjustment p0042 A82-15764

The application of programmable pocket calculators for computations during survey flights p0050 A82-16164

Programs for the statistical analysis of multispectral photographs p0044 A82-16628

Onboard utilization of ground control points for image correction. Volume 3: Ground control point simulation software design
[NASA-CR-166733] p0045 N82-10471

Onboard utilization of ground control points for image correction. Volume 4: Correlation analysis software design
[NASA-CR-166734] p0045 N82-10472

Magnetic Field Satellite (Magsat) data processing system specifications
[NASA-CR-166737] p0045 N82-11103

COMPUTER SYSTEMS DESIGN

ERSYS-SPP access method subsystem design specification
[E82-10015] p0053 N82-15493

COMPUTER TECHNIQUES

Mapping of the 1978 Kentucky River Flood from NOAA-5 satellite thermal infrared data p0035 A82-10033

Water temperature mapping by infrared scanner p0036 A82-12598

Identification of conifer species groupings from Landsat digital classifications p0002 A82-12887
A new method for computing distortion p0016 A82-12914
Cost effective computer processing of airborne scanner data for regional level mapping p0043 A82-15970
Analog methods for processing multispectral photographs p0044 A82-16623
Processing of multispectral image data on special-purpose computer systems p0044 A82-16627

COMPUTERIZED SIMULATION
SPOT data simulations: Littoral applications p0046 N82-14568

CONFERENCES
American Society of Photogrammetry, Annual Meeting, 46th, St Louis, MO, March 9-14, 1980, ASP Technical Papers p0041 A82-10027
Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, University of Wisconsin, Madison, WI, August 13, 14, 1980 p0035 A82-12589
Chesapeake Bay Plume Study: Superflux 1980 [NASA-CP-2188] p0026 N82-10661
Application of remote sensing data on the continental shelf: Proceedings of an EARsL-ESA Symposium [ESA-SP-167] p0029 N82-14553

CONGRESSIONAL REPORTS
Civil land remote sensing systems [GPO-35-265] p0056 N82-15497

CONIFERS
Identification of conifer species groupings from Landsat digital classifications p0002 A82-12887

CONTINENTAL SHELVES
Analysis of testbed airborne multispectral scanner data from Superflux II --- Chesapeake Bay plume and James Shelf data p0027 N82-10682
Assessment of Superflux relative to remote sensing --- airborne remote sensing of the Chesapeake Bay plume and shelf regions p0028 N82-10694
Application of remote sensing data on the continental shelf: Proceedings of an EARsL-ESA Symposium [ESA-SP-167] p0029 N82-14553
Studies of the Indian continental shelf: Application of remote sensing data p0031 N82-14569

COORDINATE TRANSFORMATIONS
Coordinate referencing of MKF-6 photographs and their transformation to the cartographic projection p0045 A82-16630

COORDINATES
MAGSAT: Vector magnetometer absolute sensor alignment determination [NASA-TM-79648] p0051 N82-10468

CORN
Temporal spectral response of a corn canopy p0002 A82-12886
Temporal relationships between spectral response and agronomic variables of a corn canopy p0002 A82-15038
Remote sensing of crop moisture status p0003 A82-17997

COST EFFECTIVENESS
Landsat imagery for hydrologic modeling p0036 A82-12592

COVARIANCE
Estimation of atmospheric path-radiance by the covariance matrix method p0041 A82-10861

CROP CALENDARS
Development and evaluation of an automatic labeling technique for spring small grains [E82-10001] p0004 N82-15480
US/Canada wheat and barley crop calender exploratory experiment implementation plan [E82-10016] p0005 N82-15494

CROP GROWTH
Spectral behavior of wheat yield variety trials p0002 A82-10863
The discrimination of winter wheat using a growth-state signature p0002 A82-15026

CROP IDENTIFICATION
Limitations in the spectral discrimination of the Landsat MSS p0001 A82-10046
Temporal spectral response of a corn canopy p0002 A82-12886
Methods of instrumental interpretation of multispectral aerial and space photographs p0043 A82-16607

CROP INVENTORIES
Remote sensing for vineyard management p0001 A82-10047
Temporal relationships between spectral response and agronomic variables of a corn canopy p0002 A82-15038
Development and evaluation of an automatic labeling technique for spring small grains [E82-10001] p0004 N82-15480
Wheat cultivation: Identification and estimation of areas using LANDSAT data [E82-10007] p0004 N82-15485
Fiscal year 1980-81 implementation plan in support of technical development and integration of sampling and aggregation procedures --- crop acreage estimation [E82-10013] p0005 N82-15491

CROP VIGOR
The effect of angular factors on popularly used indicators of vegetative vigor p0001 A82-10039
Remote sensing for vineyard management p0001 A82-10047
Remote sensing of crop moisture status p0003 A82-17997
Winterkill indicator model. Crop Condition Assessment Division (CCAD) data base interface driver, user's manual [E82-10014] p0005 N82-15492

CROSS POLARIZATION
SMMR data set development for GARP --- impact of cross polarization and Faraday rotation on SMMR derived brightness temperatures [NASA-CR-166721] p0052 N82-11512
Radar correlation with ice depolarization measurements of the 28.56 GHz COMSTAR beacon and associated cross polarization statistics [NASA-CR-166717] p0046 N82-14548

CRUSTAL FRACTURES
Remote sensing study of sinkhole occurrence p0019 A82-12590
Morphostructural analyses of space imagery in the central Colorado Plateau p0019 N82-10465

CURRENT SHEETS
Distant magnetic field effects associated with Birkeland currents /made possible by the evaluation of TRIAD's attitude oscillations/ p0015 A82-12215

CYCLONES
An investigation of a polar low with a spiral cloud structure p0007 A82-10616
Upper tropospheric cyclonic vortices in the tropical South Atlantic p0009 A82-16325
Meteorological lab applications of Skylab handheld-camera photographs p0011 N82-12506

D

DAMS
Application of Landsat to the inventory of DAMS p0036 A82-12593

DATA ACQUISITION
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979 [E82-10005] p0053 N82-15483
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979 [E82-10017] p0054 N82-15495

DATA BASES
The SACLANTCEN oceanographic data base. Volume 1: Design criteria and data structure and content [AD-A103277] p0029 N82-13639

DATA COMPRESSION
Data compression and reconstruction for mixed resolution multispectral sensors p0049 A82-10045

DATA CORRELATION
Factorial analysis of terrain feature positioning parameters used in combining radar and digital terrain model data p0015 A82-10029
A digital fast correlation approach to produce SEASAT SAR imagery p0042 A82-14870
Interpolating for the location of remote sensor data [NASA-TM-82169] p0052 N82-13469

DATA PROCESSING
U.S. Navy planning for satellite oceanographic data exploitation [AAS 81-072] p0024 A82-16341
Magnetic Field Satellite (Magsat) data processing system specifications [NASA-CR-166737] p0045 N82-11103
Analysis of soil moisture extraction algorithm using data from aircraft experiments [NASA-CR-166719] p0046 N82-13470
Development and evaluation of an automatic labeling technique for spring small grains [E82-10001] p0004 N82-15480
ERSYS-SPP access method subsystem design specification [E82-10015] p0053 N82-15493

DATA PROCESSING EQUIPMENT
MATE VAN: Mobile analysis and training extension --- analyzing LANDSAT digital data [NASA-TM-84056] p0045 N82-10466

DATA REDUCTION
Bureau of Land Management satellite Doppler positioning techniques p0015 A82-10057
A closer examination of the reduction of satellite magnetometer data for geological studies p0019 A82-11039
A new method for inferring carbon monoxide concentrations from gas filter radiometer data p0009 A82-16837
MATE VAN: Mobile analysis and training extension --- analyzing LANDSAT digital data [NASA-TM-84056] p0045 N82-10466
Seasat altimetry adjustment model including tidal and other sea surface effects [AD-A104188] p0026 N82-10473
Statistical Techniques Applied to Aerial Radiometric Surveys (STAARS): Series introduction and the principal-components-analysis method --- National Uranium Resource Evaluation Program [DE81-029177] p0019 N82-10476
The reduction, verification and interpretation of Magsat magnetic data over Canada [E82-10006] p0046 N82-15484

DATA SAMPLING
Fiscal year 1980-81 implementation plan in support of technical development and integration of sampling and aggregation procedures --- crop acreage estimation [E82-10013] p0005 N82-15491
Analysis of satellite observations: Theoretical studies on the sampling problem [MITT-31] p0056 N82-15499

DATA SYSTEMS
The Control Point Library Building System --- for Landsat MSS and RBV geometric image correction p0043 A82-15971
U.S. Navy planning for satellite oceanographic data exploitation [AAS 81-072] p0024 A82-16341

DECIDUOUS TREES
Evaluation of digital photographic enhancement for Dutch elm disease detection p0002 A82-12884

DEER
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal [E82-10018] p0056 N82-15496

DEFORESTATION
Remote sensing in forestry: Application to the Amazon region [E82-10012] p0005 N82-15490

DELAWARE
In situ spectral reflectance studies of tidal wetland grasses p0036 A82-15969

DELAWARE BAY (US)
Remote sensing of the Chesapeake Bay plume salinity via microwave radiometry p0027 N82-10670

DELTAS
Study of the dynamics of the Danube delta using space images p0036 A82-15961

DEPOLARIZATION
Radar correlation with ice depolarization measurements of the 28.56 GHz COMSTAR beacon and associated cross polarization statistics [NASA-CR-166717] p0046 N82-14548

DESERTS
Study of the anthropogenic influence on the environment, based on multispectral scanning images p0008 A82-15965
Space photographs obtained with the Fragment system as a base for landscape mapping and physical-geographical classification of arid territories p0009 A82-15967
Desert sand seas p0020 N82-12493

DIGITAL DATA
Factorial analysis of terrain feature positioning parameters used in combining radar and digital terrain model data p0015 A82-10029
Phytoecozonation of Sevier Lake region of Utah using digitized Landsat MSS data p0001 A82-10042
Wheat cultivation: Identification and estimation of areas using LANDSAT data [E82-10007] p0004 N82-15485

DIGITAL TECHNIQUES
American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers p0041 A82-10027
Digital image technology - MC&G impact --- Mapping, Charting, & Geodesy p0015 A82-10028
Applications of digital displays in photointerpretation and digital mapping p0041 A82-10038
Digitizing and automated output mapping errors p0015 A82-10859
Digital mapping using entities - A new concept p0041 A82-12882
Evaluation of digital photographic enhancement for Dutch elm disease detection p0002 A82-12884
A digital fast correlation approach to produce SEASAT SAR imagery p0042 A82-14870
The use of digitally processed Landsat imagery for vegetation mapping in Sulawesi, Indonesia p0003 A82-17998
Small-scale terrain mapping based on numerical interpretation of LANDSAT imagery [VTT-40] p0045 N82-10485
Some aspects of tropical storm structure revealed by handheld-camera photographs from space p0011 N82-12507
Seasat SAR processing at the Norwegian Defence Research Establishment --- design and operation of a digital process p0046 N82-14584
Maritime applications of image processing at DFVLR, Oberpfaffenhofen, West Germany --- LANDSAT multispectral scanner images, digital interactive image analysis p0032 N82-14585

DISTORTION
A new method for computing distortion p0016 A82-12914

DISTRICT OF COLUMBIA
Adaptation of land use to surficial geology in metropolitan Washington, D.C. p0010 N82-11718

DOMESTIC SATELLITE COMMUNICATIONS SYSTEMS
ISRO satellite mission support facilities - Scope and future plans p0055 A82-17307

DOPPLER EFFECT
Report of survey for McDonald Observatory, Harvard Radio Astronomy Station, and vicinity [PB81-234338] p0016 N82-13606

DOPPLER RADAR
Application of satellite Doppler techniques to the national mapping program p0015 A82-10056
Bureau of Land Management satellite Doppler positioning techniques p0015 A82-10057

DRAINAGE PATTERNS
Morphostructural analyses of space imagery in the central Colorado Plateau p0019 N82-10465
Report on Skylab 4 African drought and arid land experiment p0037 N82-12501
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10008] p0039 N82-15486

DROUGHT
Report on Skylab 4 African drought and arid land experiment p0037 N82-12501

DUNES
Desert sand seas p0020 N82-12493

DYNAMICS EXPLORER SATELLITES
Magnetic field observations on DE-A and -B --- Dynamics Explorer A and B satellites p0051 A82-16447

E

EARTH ALBEDO
The surface albedo of the earth in the near ultraviolet /330-340 nm/ p0016 A82-15032

EARTH ATMOSPHERE
Nitric oxide delta band emission in the earth's atmosphere Comparison of a measurement and a theory
p0008 A82-13268

EARTH CRUST
Space techniques to monitor movements in the earth's crust p0016 A82-18797
The mineralogy of global magnetic anomalies
[E82-10009] p0021 N82-15487

EARTH MOVEMENTS
Space techniques to monitor movements in the earth's crust p0016 A82-18797

EARTH OBSERVATIONS (FROM SPACE)
Skylab explores the Earth
[NASA-SP-380] p0019 N82-12492

EARTH RESOURCES INFORMATION SYSTEM
Civil land remote sensing systems
[GPO-35-265] p0056 N82-15497

EARTH SURFACE
Thermal inertia, thermal admittance, and the effect of layers p0008 A82-15027
The surface albedo of the earth in the near ultraviolet /330-340 nm/ p0016 A82-15032
Metrological support of measurements of earth surface brightness by the Fragment multispectral scanning system p0050 A82-15958

ECOLOGY
Use of visible and thermal satellite data to monitor an intermittently flooding marshland p0036 A82-15037
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10018] p0056 N82-15496

ECONOMIC IMPACT
Overall economic impact of an operational Meteosat system
[ESA-CR(P)-1457] p0055 N82-13010

ECOSYSTEMS
Phytoecozonation of Sevier Lake region of Utah using digitized Landsat MSS data p0001 A82-10042
Chesapeake Bay Plume Study: Superflux 1980
[NASA-CP-2188] p0026 N82-10661
Superflux I, II, and III experiment design: Remote sensing aspects p0027 N82-10664
Superflux I, II, and III experiment designs: Water sampling and analyses --- Chespeake Bay, environmental monitoring and remote sensing p0027 N82-10665
Deep Ocean Mining Environmental Study. Environmental effects of commercial-scale mining
[PB81-227753] p0029 N82-13484

ECUADOR
Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Femandian Caldera, Galapagos Islands, Ecuador
p0020 N82-12496

EDUCATIONAL TELEVISION
ISRO satellite mission support facilities - Scope and future plans p0055 A82-17307

EISCAT RADAR SYSTEM (EUROPE)
A Swedish proposal for an EISCAT/GEOS-2 experiment --- geomagnetic field models
[KGI-175] p0052 N82-10484

EJECTA
Satellite observations of the Mt. St. Helens' eruption of 18 May 1980
[AD-A105784] p0012 N82-14591

ELECTROMAGNETIC FIELDS
Radiative transfer theory for passive microwave remote sensing of random media p0049 A82-11533

EMISSION SPECTRA
Nitric oxide delta band emission in the earth's atmosphere Comparison of a measurement and a theory
p0008 A82-13268

EMISSIVITY
Reflectivity and emissivity of snow and ground at mm waves p0042 A82-14860

ENGLAND
The use of LANDSAT MSS to observe sediment distribution and movement in the Solent coastal area --- multispectral scannel (MSS) p0038 N82-14580

ENVIRONMENT EFFECTS
Deep Ocean Mining Environmental Study. Environmental effects of commercial-scale mining
[PB81-227753] p0029 N82-13484

ENVIRONMENT MANAGEMENT
Requirements in pollution monitoring and coastal management p0030 N82-14558

ENVIRONMENTAL MONITORING
Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, University of Wisconsin, Madison, WI, August 13, 14, 1980
p0035 A82-12589
Use of visible and thermal satellite data to monitor an intermittently flooding marshland p0036 A82-15037
Study of the anthropogenic influence on the environment, based on multispectral scanning images
p0008 A82-15965
ISRO satellite mission support facilities - Scope and future plans p0055 A82-17307
User needs and the future of operational meteorological satellites
[AIAA PAPER 82-0388] p0051 A82-17918
The radiowave propagation environment - Science and technology objectives for the 80's p0009 A82-18052
A marine environmental monitoring and assessment program p0027 N82-10663
Superflux I, II, and III experiment design: Remote sensing aspects p0027 N82-10664
Superflux I, II, and III experiment designs: Water sampling and analyses --- Chespeake Bay, environmental monitoring and remote sensing p0027 N82-10665
Monitoring the Chesapeake Bay using satellite data for Superflux III p0027 N82-10668
Shuttle applications in tropospheric air quality observations
[NASA-CR-145374] p0010 N82-11635
Environmental Monitoring Report, Sandia National Labs., Albuquerque, New Mexico, 180
[DE81-027839] p0010 N82-11649
Snow-mapping experiment p0037 N82-12498
Quantitative analysis of atmospheric pollution phenomena p0010 N82-12505
Limit on remote FTIR detection of trace gases
[AD-A104842] p0011 N82-12511
Environmental data for sites in the National Solar Data Network
[DE82-000071] p0011 N82-12707
Special observations by the Hohenpeissenberg Meteorological Observatory. Number 42: Results of aerological and surface ozone measurements during the first semester of 1980
[SONDERBEOB-42] p0012 N82-12714
Aircraft data summaries of the SURE intensives, volume 4
[DE82-900311] p0012 N82-13569
ERS-1: Mission objectives and system concept
p0029 N82-14554
The need for integrated off-shore, real-time information and management systems p0055 N82-14555
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0030 N82-14557
Fisheries investigations and management benefits from remote sensing --- fish tracking p0030 N82-14559
A look at nonsatellite remote sensing systems for marine use --- together with satellite systems, overall view of the technology p0032 N82-14586
Study of a combined satellite system for remote sensing and earth-oriented research (LOCSS) --- ESA satellite
[BMFT-FB-W-81-002] p0055 N82-14615
Meteorological satellites
[AD-A107427] p0053 N82-15110
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] p0013 N82-15488
National Hurricane operations plan
[PB81-247231] p0013 N82-15697
Environmental satellite imagery, March 1981
[PB81-248049] p0047 N82-15698

EQUATORIAL REGIONS
CTD/02 measurements during the Equatorial Pacific Ocean Climate Study (EPOCS) in 1979
[PB81-211203] p0026 N82-10461

EROSION
Satellite imagery and shoreline erosion prediction
p0036 A82-12585
A method for using aerial photos in delineating historic patterns of beach accretion and retreat
[PB81-223836] p0010 N82-11536
Airborne remote sensing of the coastal zone
p0053 N82-14577

ERROR ANALYSIS
Factorial analysis of terrain feature positioning parameters used in combining radar and digital terrain model data
p0015 A82-10029
Digitizing and automated output mapping errors
p0015 A82-10859
Concerning the geometric accuracy of infrared scanner photographs p0042 A82-13634
Some problem areas in the field of quality control for aerotriangulation p0016 A82-16161

ERROR CORRECTING DEVICES
Block adjustment with additional parameters
p0049 A82-13738
The MSS control point location error filter for LANDSAT-D p0051 N82-10073

ERS-1 (ESA SATELLITE)
ERS-1: Mission objectives and system concept
p0029 N82-14554

ESA SATELLITES
Study of a combined satellite system for remote sensing and earth-oriented research (LOCSS) --- ESA satellite
[BMFT-FB-W-81-002] p0055 N82-14615

ESTUARIES
Field study for Landsat water quality verification
p0036 A82-12597
Remote sensing of benthic microalgal biomass with a tower-mounted multispectral scanner p0024 A82-15031
Chesapeake Bay Plume Study: Superflux 1980
[NASA-CP-2188] p0026 N82-10661
Superflux I, II, and III experiment design: Remote sensing aspects p0027 N82-10664
Remote sensing of the Chesapeake Bay plume salinity via microwave radiometry p0027 N82-10670
Preliminary analysis of ocean color scanner data from Superflux III p0027 N82-10672
SPOT data simulations: Littoral applications
p0046 N82-14568
The use of LANDSAT MSS to observe sediment distribution and movement in the Solent coastal area --- multispectral scannel (MSS) p0038 N82-14580

EUROPE
Spacelab-research of European regions with strong negative environmental influences, based on AVHRR-data of the satellites Tiros-N and NOAA p0007 A82-12517
Availability of Seasat synthetic aperture radar imagery
p0050 A82-15039

EUTROPHICATION
The operational use of Landsat for lake quality assessment p0036 A82-12596

EVAPOTRANSPIRATION
A simulation study of the recession coefficient for antecedent precipitation index --- soil moisture and water runoff estimation
[NASA-TM-83860] p0038 N82-14549

F

FARADAY EFFECT
SMMR data set development for GARP --- impact of cross polarization and Faraday rotation on SMMR derived brightness temperatures
[NASA-CR-166721] p0052 N82-11512

FARMLANDS
Satellite sensing of irrigation patterns in semiarid areas - An Indian study p0002 A82-10864
Study and mapping of agricultural land use, based on space images p0003 A82-15963
Aircraft radar response to soil moisture
p0003 A82-17564
Vegetation patterns p0004 N82-12500

FIELD OF VIEW
The choice of the orientation of the analyzer in polarimetric surveys p0044 A82-16621
Scanner --- photography from a spin stabilized synchronous satellite
[NASA-CASE-GSC-12032-2] p0052 N82-13465
Interpolating for the location of remote sensor data
[NASA-TM-82169] p0052 N82-13469

FINLAND
Compensation of systematic errors of image and model coordinates p0043 A82-15765
Small-scale terrain mapping based on numerical interpretation of LANDSAT imagery
[VTT-40] p0045 N82-10485

FIORDS
Mapping of surface currents in Greenland fiords by means of LANDSAT images --- multispectral photography
p0038 N82-14579

FIRES
Quantitative analysis of atmospheric pollution phenomena p0010 N82-12505

FISHERIES
The use of satellite infrared imagery for describing ocean processes in relation to spawning of the northern anchovy /Engraulis mordax/ p0025 A82-17565
Application of remote sensing data on the continental shelf: Proceedings of an EAReL-ESA Symposium
[ESA-SP-167] p0029 N82-14553
Fisheries investigations and management benefits from remote sensing --- fish tracking p0030 N82-14559
The Seasat commercial demonstration program
p0030 N82-14561
A short review of an oceanographic use of Meteosat data by the ORSTOM remote sensing service
p0031 N82-14570

FLIGHT TESTS
Three bearing method for passive triangulation in systems with unknown deterministic biases p0050 A82-15920

FLOOD PLAINS
Mapping of the 1978 Kentucky River Flood from NOAA-5 satellite thermal infrared data p0035 A82-10033

FLOOD PREDICTIONS
Satellite rainfall estimation for hydrologic forecasting
p0035 A82-10032

A systems approach to the real-time runoff analysis with a deterministic rainfall-runoff model
[PB81-224495] p0037 N82-11530
Analysis of rainfall from flash flood producing thunderstorms, using GOES data p0038 N82-14724

FLOODS
Use of visible and thermal satellite data to monitor an intermittently flooding marshland p0036 A82-15037
Cost effective computer processing of airborne scanner data for regional level mapping p0043 A82-15970

FLORIDA
Field study for Landsat water quality verification p0036 A82-12597
Optically processed Seasat radar mosaic of Florida p0042 A82-15125

FLUORESCENCE
Application of the NASA airborne oceanographic lidar to the mapping of chlorophyll and other organic pigments p0027 N82-10684
A recommended sensor package for the detection and tracking of oil spills p0053 N82-14563

FOREST FIRES
Quantitative analysis of atmospheric pollution phenomena p0010 N82-12505

FOREST MANAGEMENT
A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras p0003 A82-15748
Rural development in the humid tropics p0003 A82-16162
Large-scale color aerial photography as a tool in sampling for mortality rates
[PB81-214777] p0003 N82-10489

FORESTS
Mapping vegetation association boundaries with Landsat MSS data - An Oklahoma example p0001 A82-10041
Stand density estimation on panoramic transparencies p0002 A82-10862
Remote sensing contributions to the management of renewable resources p0055 A82-12530
Identification of conifer species groupings from Landsat digital classifications p0002 A82-12887
Mapping of forest vegetation on the basis of space images p0003 A82-15964
Study of the anthropogenic influence on the environment, based on multispectral scanning images p0008 A82-15965
The use of digitally processed Landsat imagery for vegetation mapping in Sulawesi, Indonesia p0003 A82-17998
Vegetation patterns p0004 N82-12500
Application of remote sensing to selected problems within the state of California
[E82-10004] p0004 N82-15482
Remote sensing in forestry. Application to the Amazon region
[E82-10012] p0005 N82-15490

FRAMING CAMERAS
Orientation and construction of models. I - The orientation problem in close-range photogrammetry p0049 A82-10858

FRANCE
The operational oil pollution surveillance system being used in France. Forecasted future developments in consideration of the NATO/CCMS remote sensing pilot study conclusions p0012 N82-14573

FRESH WATER
Recent work in passive optical imaging of water --- space and aircraft derived data p0038 N82-14575

FRONTS (METEOROLOGY)
An investigation of a polar low with a spiral cloud structure p0007 A82-10616

G

GALILEAN SATELLITES
Coordinates of features on the Galilean satellites p0019 A82-12366

GAS ANALYSIS
A new method for inferring carbon monoxide concentrations from gas filter radiometer data p0009 A82-16837
Proof of concept study
[AD-A104338] p0010 N82-11639

GEOCHRONOLOGY
Study of the time evolution of the lithosphere
[NASA-CR-164968] p0016 N82-11696

GEODESY
Digital image technology - MC&G impact --- Mapping, Charting, & Geodesy p0015 A82-10028
Space techniques to monitor movements in the earth's crust p0016 A82-18797
Study of the time evolution of the lithosphere
[NASA-CR-164968] p0016 N82-11696
Reports of Planetary Geology Program, 1981
[NASA-TM-84211] p0016 N82-14041
Description and comparison of algorithms for solving large sets of sparse matrix normal equations in geodesy and photogrammetry
[SER-C-261] p0017 N82-15812

GEODETIC SURVEYS
Application of satellite Doppler techniques to the national mapping program p0015 A82-10056
Bureau of Land Management satellite Doppler positioning techniques p0015 A82-10057
GPS application to mapping, charting and geodesy p0015 A82-10645
Phototriangulation with map referencing of photographs in linear surveys p0016 A82-12912
Some problem areas in the field of quality control for aerotriangulation p0016 A82-16161
Theoretical reliability of elementary photogrammetric procedures. I p0043 A82-16163
Report of survey for McDonald Observatory, Harvard Radio Astronomy Station, and vicinity
[PB81-234338] p0016 N82-13606
A history of flying and photography. In the Photogrammetry Division of the National Ocean Survey 1919 - 1979
[PB81-246738] p0017 N82-15520

GEOLOGICAL FAULTS
Morphostructural analyses of space imagery in the central Colorado Plateau p0019 N82-10465
Global Tectonics. Some Geologic analyses of observations and photographs from Skylab p0020 N82-12494

GEOLOGICAL SURVEYS
A closer examination of the reduction of satellite magnetometer data for geological studies p0019 A82-11039
Coordinates of features on the Galilean satellites p0019 A82-12366
Statistical Techniques Applied to Aerial Radiometric Surveys (STAARS). Series introduction and the principal-components-analysis method --- National Uranium Resource Evaluation Program
[DE81-029177] p0019 N82-10476
Skylab explores the Earth
[NASA-SP-380] p0019 N82-12492
Global Tectonics. Some Geologic analyses of observations and photographs from Skylab p0020 N82-12494
Geological features of southwestern North America p0020 N82-12495
Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador p0020 N82-12496
The Manicouagan impact structure observed from Skylab
[CONTRIB-544] p0020 N82-12497
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0021 N82-15489
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] p0022 N82-15506

GEOLOGY
Geology and linears of Libya p0019 N82-10618
Adaptation of land use to surficial geology in metropolitan Washington, D.C p0010 N82-11718

GEOMAGNETISM
A closer examination of the reduction of satellite magnetometer data for geological studies p0019 A82-11039
Magnetic field-aligned electron distributions in the dayside cusp p0015 A82-12186
Distant magnetic field effects associated with Birkeland currents /made possible by the evaluation of TRIAD's attitude oscillations/ p0015 A82-12215
Magnetic field observations on DE-A and -B --- Dynamics Explorer A and B satellites p0051 A82-16447
Use of hydromagnetic waves to map geomagnetic field lines p0016 A82-16868
A Swedish proposal for an EISCAT/GEOS-2 experiment --- geomagnetic field models
[KGI-175] p0052 N82-10484
Magnetic Field Satellite (Magsat) data processing system specifications
[NASA-CR-166737] p0045 N82-11103
The mineralogy of global magnetic anomalies
[E82-10009] p0021 N82-15487

GEOMETRIC RECTIFICATION (IMAGERY)
Factorial analysis of terrain feature positioning parameters used in combining radar and digital terrain model data p0015 A82-10029
Two-dimensional resampling of line scan imagery by one-dimensional processing p0041 A82-10860
Digital mapping using entities - A new concept p0041 A82-12882
A new method for computing distortion p0016 A82-12914
Concerning the geometric accuracy of infrared scanner photographs p0042 A82-13634
Block adjustment with additional parameters p0049 A82-13738
Compensation of systematic errors in bundle adjustment p0042 A82-15764
Compensation of systematic errors of image and model coordinates p0043 A82-15765
The Control Point Library Building System --- for Landsat MSS and RBV geometric image correction p0043 A82-15971
Computational aspects of geometric correction data generation in the LANDSAT-D imagery processing p0045 N82-10072

GEOMORPHOLOGY
Development of a coastal relief of the Gulf of Riga, based on results of an analysis of space images p0024 A82-15962
Investigation and mapping of the erosion relief of the Kalachskaia upland on the basis of multispectral scanner images p0008 A82-15966
Space photographs obtained with the Fragment system as a base for landscape mapping and physical-geographical classification of arid territories p0009 A82-15967
Morphostructural analyses of space imagery in the central Colorado Plateau p0019 N82-10465
Desert sand seas p0020 N82-12493

GEOPHYSICS
Analysis of satellite observations. Theoretical studies on the sampling problem
[MITT-31] p0056 N82-15499

GEOTHERMAL RESOURCES
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0021 N82-15489

GLACIOLOGY
Study on satellite radar altimetry in climatological and oceanographic research, volume 1
[SP/153/06/01/FR(80)-VOL-1] p0026 N82-10486
Study on satellite radar altimetry in climatological and oceanographic research, volume 2
[SP/153/06/01FR(80)-VOL-2] p0026 N82-10487

GLOBAL AIR POLLUTION
A new method for inferring carbon monoxide concentrations from gas filter radiometer data p0009 A82-16837

GLOBAL ATMOSPHERIC RESEARCH PROGRAM
SMMR data set development for GARP --- impact of cross polarization and Faraday rotation on SMMR derived brightness temperatures
[NASA-CR-166721] p0052 N82-11512

GLOBAL POSITIONING SYSTEM
GPS application to mapping, charting and geodesy p0015 A82-10645
Onboard utilization of ground control points for image correction. Volume 1: Executive summary
[NASA-CR-166731] p0045 N82-10469
Onboard utilization of ground control points for image correction. Volume 2: Analysis and simulation results
[NASA-CR-166732] p0045 N82-10470
Onboard utilization of ground control points for image correction. Volume 3: Ground control point simulation software design
[NASA-CR-166733] p0045 N82-10471
Onboard utilization of ground control points for image correction. Volume 4: Correlation analysis software design
[NASA-CR-166734] p0045 N82-10472

GOES SATELLITES
User needs and the future of operational meteorological satellites
[AIAA PAPER 82-0388] p0051 A82-17918

GOVERNMENT/INDUSTRY RELATIONS
The Seasat commercial demonstration program p0030 N82-14561

GRAINS (FOOD)
Development and evaluation of an automatic labeling technique for spring small grains
[E82-10001] p0004 N82-15480

GRASSES
In situ spectral reflectance studies of tidal wetland grasses p0036 A82-15969

GRASSHOPPERS
Remote sensing applications to resource problems in South Dakota
[E82-10002] p0004 N82-15481

GRASSLANDS
The effect of angular factors on popularly used indicators of vegetative vigor p0001 A82-10039
Mapping vegetation association boundaries with Landsat MSS data - An Oklahoma example p0001 A82-10041

GRATINGS (SPECTRA)
The application of holographic gratings in spectrometers for the spatial-spectral analysis of the earth's surface from aerial and space platforms in the visible and near-infrared spectral regions p0044 A82-16614

GRAVELS
Remote sensing studies of some ironstone gravels and plinthite in Thailand p0019 N82-12491

GRAVIMETRY
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] p0022 N82-15506

GRAVITY WAVES
The influence of gravity waves on radiometric measurements - A case study p0049 A82-13547

GRAZING INCIDENCE
Radar backscattering from ocean waves at low grazing angles p0023 A82-14730

GREAT BASIN (US)
Phytoecoronation of Sevier Lake region of Utah using digitized Landsat MSS data p0001 A82-10042

GREAT LAKES (NORTH AMERICA)
Data sources for analyses of Great Lakes wetlands p0035 A82-10054

GREAT PLAINS CORRIDOR (NORTH AMERICA)
US/Canada wheat and barley crop calender exploratory experiment implementation plan [E82-10016] p0005 N82-15494

GREENLAND
Measurement of sea and ice backscatter reflectivity using an OTH radar system p0025 A82-18074
The ice-conditions in the Greenland waters, 1965. Coastal maps [ISBN-87-7478-183-9] p0026 N82-10467
The ice conditions in the Greenland waters [ISBN-87-7478-183-9] p0028 N82-12533
Mapping of surface currents in Greenland fiords by means of LANDSAT images --- multispectral photography p0038 N82-14579

GROUND TRUTH
The mineralogy of global magnetic anomalies [E82-10009] p0021 N82-15487

GUATEMALA
Radar mapping, archaeology, and ancient land use in the Maya lowlands [NASA-CR-164931] p0010 N82-11514
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab p0020 N82-12494

GULF OF ALASKA
An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry p0030 N82-14564

GULFS
Comparison of polar and geostationary satellite infrared observations of sea surface temperatures in the Gulf of Maine p0024 A82-15030
Development of a coastal relief of the Gulf of Riga, based on results of an analysis of space images p0024 A82-15962
Visual observations of floating ice from Skylab p0037 N82-12504

H

HABITATS
Repetitive aerial photography for assessing marsh vegetation changes p0001 A82-10048
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal [E82-10018] p0056 N82-15496

HAWAII
A method for using aerial photos in delineating historic patterns of beach accretion and retreat [PB81-223836] p0010 N82-11536
Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador p0020 N82-12496

HAZE
Multitemporal calibration of LANDSAT images: A method for improving the marine phenomena recognition, with as example the Venice lagoon --- brightness/green/yellow feature space, image enhancement p0046 N82-14578

HEAT FLUX
Thermal inertia, thermal admittance, and the effect of layers p0008 A82-15027

HEAT STORAGE
Variations in upper ocean heat storage determined from satellite data p0025 A82-17567

HOLOGRAPHY
The application of holographic gratings in spectrometers for the spatial-spectral analysis of the earth's surface from aerial and space platforms in the visible and near-infrared spectral regions p0044 A82-16614

HOMING DEVICES
A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras p0003 A82-15748

HURRICANES
National Hurricane operations plan [PB81-247231] p0013 N82-15697

HYDROCARBONS
Automated analyzer for aircraft measurements of atmospheric methane and total hydrocarbons p0007 A82-11949

HYDROGRAPHY
Application of Landsat to the inventory of DAMS p0036 A82-12593
Study of the dynamics of the Danube delta using space images p0036 A82-15961
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images [E82-10008] p0039 N82-15486

HYDROLOGY
Satellite rainfall estimation for hydrologic forecasting p0035 A82-10032
Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, University of Wisconsin, Madison, WI, August 13, 14, 1980 p0035 A82-12589
Landsat imagery for hydrologic modeling p0036 A82-12592
Field study for Landsat water quality verification p0036 A82-12597
Operational use of remote sensing for coastal zone management and possible contribution of specialized satellites --- aerial photography p0031 N82-14574
The effect of spatial variability in precipitation on streamflow [AD-A105955] p0038 N82-14589

HYDROLOGY MODELS
Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, University of Wisconsin, Madison, WI, August 13, 14, 1980 p0035 A82-12589
An application of Landsat derived data to a regional hydrologic model p0037 A82-17999

HYDROMETEOROLOGY
A systems approach to the real-time runoff analysis with a deterministic rainfall-runoff model [PB81-224495] p0037 N82-11530
A simulation study of the recession coefficient for antecedent precipitation index --- soil moisture and water runoff estimation [NASA-TM-83860] p0038 N82-14549
Meteorological satellites [AD-A107427] p0053 N82-15110

I

ICE
Radar correlation with ice depolarization measurements of the 28.56 GHz COMSTAR beacon and associated cross polarization statistics [NASA-CR-166717] p0046 N82-14548

ICE MAPPING
The ice-conditions in the Greenland waters, 1965. Coastal maps [ISBN-87-7478-183-9] p0026 N82-10467
Ice conditions in the eastern Bering Sea from NOAA and LANDSAT imagery: Winter conditions 1974, 1976, 1977, 1979 [PB81-220188] p0028 N82-11537
The Norwegian remote sensing experiment (Norsex) in a marginal ice zone p0031 N82-14566

ICE REPORTING
Visual observations of floating ice from Skylab p0037 N82-12504
The ice conditions in the Greenland waters [ISBN-87-7478-183-9] p0028 N82-12533
Marine activities in Sweden for which remote sensing data may be of interest --- oceanography, weather forecasting, and analysis p0031 N82-14576

ILLINOIS
The effect of spatial variability in precipitation on streamflow [AD-A105955] p0038 N82-14589

IMAGE CONTRAST
Calculation of the decrease in the contrast of objects of a place due to light scattering in the atmosphere p0042 A82-13833
Estimation of the brightness field from results of multispectral photography of the earth from space p0044 A82-16617
Polarimetric surveys of oil slicks p0009 A82-16619
Images of sea waves obtained in polarimetric surveys p0024 A82-16620
The choice of the orientation of the analyzer in polarimetric surveys p0044 A82-16621

IMAGE ENHANCEMENT
Evaluation of digital photographic enhancement for Dutch elm disease detection p0002 A82-12884
Multitemporal calibration of LANDSAT images: A method for improving the marine phenomena recognition, with as example the Venice lagoon --- brightness/green/yellow feature space, image enhancement p0046 N82-14578

IMAGE FILTERS
Spectral correlation filters and natural colour coding p0043 A82-16160

IMAGE PROCESSING
American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers p0041 A82-10027
Digital image technology - MC&G impact --- Mapping, Charting, & Geodesy p0015 A82-10028
Mapping of the 1978 Kentucky River Flood from NOAA-5 satellite thermal infrared data p0035 A82-10033
Applications of digital displays in photointerpretation and digital mapping p0041 A82-10038
An improvement in land cover classification achieved by merging microwave data with Landsat multispectral scanner data p0007 A82-10043
Preliminary results of mapping urban land cover with Seasat SAR imagery p0007 A82-10044
Absolute image registration for geosynchronous satellites p0049 A82-10051
Two-dimensional resampling of line scan imagery by one-dimensional processing p0041 A82-10860
Intercalibration of Landsat 1-3 and NOAA 6 and 7 scanner data p0049 A82-13293
Investigations concerning the image-controlled segmentation of objects in multispectral imagery data --- German thesis p0042 A82-15003
Texture transforms of remote sensing data p0042 A82-15034
Optically processed Seasat radar mosaic of Florida p0042 A82-15125
Analysis of variance of thematic mapping experiment data p0009 A82-15968
Cost effective computer processing of airborne scanner data for regional level mapping p0043 A82-15970
The Control Point Library Building System --- for Landsat MSS and RBV geometric image correction p0043 A82-15971
Airborne and spaceborne multispectral photography of the earth --- Russian book p0043 A82-16601
Geometric quality of MKF-6 photographs p0043 A82-16606
The maximum mean accuracy of classification of remote-sensing objects and the influence on this accuracy of data acquisition and processing methods p0044 A82-16615
Analog methods for processing multispectral photographs p0044 A82-16623
Structural analysis of aerial and space images p0044 A82-16625
Processing of multispectral image data on special-purpose computer systems p0044 A82-16627
Programs for the statistical analysis of multispectral photographs p0044 A82-16628
Coordinate referencing of MKF-6 photographs and their transformation to the cartographic projection p0045 A82-16630
The use of digitally processed Landsat imagery for vegetation mapping in Sulawesi, Indonesia p0003 A82-17998
Distortion-free mapping of VISSR imagery data from geosynchronous satellites p0051 N82-10071
Computational aspects of geometric correction data generation in the LANDSAT-D imagery processing p0045 N82-10072
MATE VAN: Mobile analysis and training extension --- analyzing LANDSAT digital data [NASA-TM-84056] p0045 N82-10466
Onboard utilization of ground control points for image correction. Volume 1: Executive summary [NASA-CR-166731] p0045 N82-10469
Onboard utilization of ground control points for image correction. Volume 2: Analysis and simulation results [NASA-CR-166732] p0045 N82-10470
Onboard utilization of ground control points for image correction. Volume 3: Ground control point simulation software design [NASA-CR-166733] p0045 N82-10471
Onboard utilization of ground control points for image correction. Volume 4: Correlation analysis software design [NASA-CR-166734] p0045 N82-10472
Small-scale terrain mapping based on numerical interpretation of LANDSAT imagery [VTT-40] p0045 N82-10485
Identification of lithologic units using multichannel imaging systems p0046 N82-11509
Airborne remote sensing of the coastal zone p0053 N82-14577
Seasat SAR processing at the Norwegian Defence Research Establishment --- design and operation of a digital process p0046 N82-14584
Maritime applications of image processing at DFVLR, Oberpfaffenhofen, West Germany --- LANDSAT multispectral scanner images, digital interactive image analysis p0032 N82-14585

IMAGE RECONSTRUCTION
Data compression and reconstruction for mixed resolution multispectral sensors p0049 A82-10045

IMAGE RESOLUTION
Data compression and reconstruction for mixed resolution multispectral sensors p0049 A82-10045
Aspects in the development of aerial-photography tasks p0041 A82-12913
A new method for computing distortion p0016 A82-12914
Characteristics of the photometry of small objects from aerial and space photographs p0044 A82-16616
Distortion-free mapping of VISSR imagery data from geosynchronous satellites p0051 N82-10071

IMAGE ROTATION
Two-dimensional resampling of line scan imagery by one-dimensional processing p0041 A82-10860

IMAGING TECHNIQUES
SAR imaging of ocean waves - Theory p0023 A82-11202
Study on calibration methods for Earth observation optical imaging instruments [UCD-207/1/80] p0052 N82-10488
A recommended sensor package for the detection and tracking of oil spills p0053 N82-14563

IN-FLIGHT MONITORING
Infrared radiance model variation by sensor flight measurements p0052 N82-14171

INCIDENCE
New baseline system p0054 N82-15501
Squinted SAR system p0047 N82-15502

INDIA
Satellite sensing of irrigation patterns in semiarid areas: An Indian study p0002 A82-10864
Cost effective computer processing of airborne scanner data for regional level mapping p0043 A82-15970
Detection of monsoon inversion by TIROS-N satellite p0024 A82-17168
Studies of the Indian continental shelf: Application of remote sensing data p0031 N82-14569

INDIAN OCEAN

Analysis of SEASAT wind observations over the Indian Ocean p0023 A82-10671

ICAPS oceanographic data for the Indian Ocean [AD-A103173] p0029 N82-13641

An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry p0030 N82-14564

INDIAN SPACE PROGRAM

ISRO satellite mission support facilities - Scope and future plans p0055 A82-17307

INDIAN SPACECRAFT

Scientific studies using Bhaskara satellite microwave radiometer (SAMIR) data: A short overview --- calibration of the instrument and its use in the study of oceanographic parameters p0032 N82-14587

INDONESIA

Rural development in the humid tropics p0003 A82-16162

The use of digitally processed Landsat imagery for vegetation mapping in Sulawesi, Indonesia p0003 A82-17998

INERTIAL NAVIGATION

Photo inertial positioning system development at the Canada Centre for Remote Sensing p0045 A82-18167

INFESTATION

Vegetation patterns p0004 N82-12500

Remote sensing applications to resource problems in South Dakota [E82-10002] p0004 N82-15481

INFRARED ASTRONOMY

Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy [PREPRINT-69] p0020 N82-12713

INFRARED IMAGERY RADIOMETRIC RESOLUTION

Water temperature mapping by infrared scanner p0036 A82-12598

INFRARED PHOTOGRAPHY

Concerning the geometric accuracy of infrared scanner photographs p0042 A82-13634

INFRARED RADIATION

Biological patchiness in relation to satellite thermal imagery and associated chemical mesoscale features [AD-A105757] p0047 N82-15504

INFRARED REFLECTION

Mapping of the 1978 Kentucky River Flood from NOAA-5 satellite thermal infrared data p0035 A82-10033

Effect of grain size and snowpack water equivalence on visible and near-infrared satellite observations of snow p0035 A82-12553

INFRARED SPECTRA

Proof of concept study [AD-A104338] p0010 N82-11639

Inclusion of a simple vegetation layer in terrain temperature models for thermal infrared (IR) signature prediction [AD-A104469] p0003 N82-11910

Satellite observations of the Mt. St. Helens' eruption of 18 May 1980 [AD-A105784] p0012 N82-14591

INFRARED SPECTROSCOPY

Trace pollutant concentrations in a multiday smog episode in the California South Coast Air Basin by long path length Fourier transform infrared spectroscopy p0007 A82-10700

Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy [PREPRINT-69] p0020 N82-12713

INFRARED TRACKING

Satellite observations of the Mt. St. Helens' eruption of 18 May 1980 [AD-A105784] p0012 N82-14591

INLAND WATERS

The operational use of Landsat for lake quality assessment p0036 A82-12596

An inertially-aided aircraft track recovery system for coastal mapping p0037 A82-18166

INSOLATION

Environmental data for sites in the National Solar Data Network [DE82-000071] p0011 N82-12707

INSTRUMENT ERRORS

Ionospheric propagation correction modeling for satellite altimeters [NASA-CR-156881] p0052 N82-12447

INSTRUMENT ORIENTATION

Orientation and construction of models. III - Mathematical basis of the orientation problem of one-dimensional central perspective photographs p0043 A82-15973

Images of sea waves obtained in polarimetric surveys p0024 A82-16620

The choice of the orientation of the analyzer in polarimetric surveys p0044 A82-16621

An inertially-aided aircraft track recovery system for coastal mapping p0037 A82-18166

MAGSAT: Vector magnetometer absolute sensor alignment determination [NASA-TM-79648] p0051 N82-10468

Infrared radiance model variation by sensor flight measurements p0052 N82-14171

INTERNAL WAVES

Visual observations of the ocean p0028 N82-12502

An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs p0028 N82-12503

Surface signs of internal ocean dynamics [AD-A101380] p0029 N82-13642

INTERPOLATION

Interpolating for the location of remote sensor data [NASA-TM-82169] p0052 N82-13469

IONOSPHERE

A Swedish proposal for an EISCAT/GEOS-2 experiment --- geomagnetic field models [KGI-175] p0052 N82-10484

IONOSPHERIC CURRENTS

Characteristics of westward travelling surges during magnetospheric substorms p0050 A82-14299

IONOSPHERIC DRIFT

Use of hydromagnetic waves to map geomagnetic field lines p0016 A82-16868

IONOSPHERIC ELECTRON DENSITY

Magnetic field-aligned electron distributions in the dayside cusp p0015 A82-12186

IONOSPHERIC PROPAGATION

The radiowave propagation environment - Science and technology objectives for the 80's p0009 A82-18052

Ionospheric propagation correction modeling for satellite altimeters [NASA-CR-156881] p0052 N82-12447

IRELAND

The feasibility of using remotely sensed color as an index of Irish coastal water properties --- statistical correlation of sea truth data p0032 N82-14581

IRON COMPOUNDS

Remote sensing studies of some ironstone gravels and plinthite in Thailand p0019 N82-12491

IRRADIANCE

The color of the sea and its relation to surface chlorophyll and depth of the euphotic zone p0030 N82-14562

IRRIGATION

Satellite sensing of irrigation patterns in semiarid areas - An Indian study p0002 A82-10864

ISLANDS

Mesoscale wake clouds in Skylab photographs p0011 N82-12508

Boundary detection criteria for satellite altimeters [NASA-CR-156880] p0028 N82-12734

ITALY

Study of stack emissions by combination of lidar and correlation spectrometer p0008 A82-12816

Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Femandian Caldera, Galapagos Islands, Ecuador p0020 N82-12496

J

JAPAN

Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Femandian Caldera, Galapagos Islands, Ecuador p0020 N82-12496

JET STREAMS (METEOROLOGY)

Meteorological lab applications of Skylab handheld-camera photographs p0011 N82-12506

K

KANSAS

Interactive techniques for estimating precipitation from GOES imagery p0041 A82-13121

The discrimination of winter wheat using a growth-state signature p0002 A82-15026

Aircraft radar response to soil moisture p0003 A82-17564

KENTUCKY

Mapping of the 1978 Kentucky River Flood from NOAA-5 satellite thermal infrared data p0035 A82-10033

L

LAGOONS

Multitemporal calibration of LANDSAT images: A method for improving the marine phenomena recognition, with as example the Venice lagoon --- brightness/green/yellow feature space, image enhancement p0046 N82-14578

LAKE ICE

The development of the Tiros Global Environmental Satellite System [AIAA PAPER 82-0383] p0025 A82-17915

Visual observations of floating ice from Skylab p0037 N82-12504

LAKE ONTARIO

Visual observations of floating ice from Skylab p0037 N82-12504

Recent work in passive optical imaging of water --- space and aircraft derived data p0038 N82-14575

LAKES

Remote sensing that motivated community action p0008 A82-12594

The operational use of Landsat for lake quality assessment p0036 A82-12596

Role of remote sensing in the study of acid rain impact on aquatic systems [AIAA PAPER 82-0336] p0036 A82-17892

The Manicouagan impact structure observed from Skylab [CONTRIB-544] p0020 N82-12497

LAND ICE

Measurement of sea and ice backscatter reflectivity using an OTH radar system p0025 A82-18074

LAND MANAGEMENT

Remote sensing for vineyard management p0001 A82-10047

Bureau of Land Management satellite Doppler positioning techniques p0015 A82-10057

Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, University of Wisconsin, Madison, WI, August 13, 14, 1980 p0035 A82-12589

Adaptation of land use to surficial geology in metropolitan Washington, D.C. p0010 N82-11718

LAND USE

Introducing remote sensing to county-level agencies in Michigan through the Cooperative Extension Service p0007 A82-10034

Remote sensing techniques in the study of the agricultural potential of soils under the Cerrado vegetation /Brazil/ p0001 A82-10040

Preliminary results of mapping urban land cover with Seasat SAR imagery p0007 A82-10044

Areawide soil loss predictions using CIR airphotos p0007 A82-12591

Study of the dynamics of the Danube delta using space images p0036 A82-15961

Study and mapping of agricultural land use, based on space images p0003 A82-15963

Study of the anthropogenic influence on the environment, based on multispectral scanning images p0008 A82-15965

Analysis of variance of thematic mapping experiment data p0009 A82-15968

An evaluation of the spatial resolution of soil moisture information [NASA-CR-166724] p0009 N82-11513

Radar mapping, archaeology, and ancient land use in the Maya lowlands [NASA-CR-164931] p0010 N82-11514

Adaptation of land use to surficial geology in metropolitan Washington, D.C. p0010 N82-11718

Cultural features imaged and observed from Skylab 4 p0010 N82-12499

Vegetation patterns p0004 N82-12500

Report on Skylab 4 African drought and arid land experiment p0037 N82-12501

A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal [E82-10018] p0056 N82-15496

LANDSAT D

Computational aspects of geometric correction data generation in the LANDSAT-D imagery processing p0045 N82-10072

The MSS control point location error filter for LANDSAT-D p0051 N82-10073

LANDSAT 2

LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979 [E82-10005] p0053 N82-15483

LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979 [E82-10017] p0054 N82-15495

LANDSAT 3

LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979 [E82-10005] p0053 N82-15483

LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979 [E82-10017] p0054 N82-15495

LASER APPLICATIONS

Airborne laser acquisition of cross-section data p0049 A82-12600

Analog methods for processing multispectral photographs p0044 A82-16623

Space techniques to monitor movements in the earth's crust p0016 A82-18797

Remote sensing of sea state by laser altimeters [NASA-CR-165049] p0033 N82-14789

LIBERIA

A history of flying and photography: In the Photogrammetry Division of the National Ocean Survey 1919 - 1979 [PB81-246738] p0017 N82-15520

LIBRATION

Distant magnetic field effects associated with Birkeland currents /made possible by the evaluation of TRIAD's attitude oscillations/ p0015 A82-12215

LIBYA

Geology and linears of Libya p0019 N82-10818

LIGHT SCATTERING

Calculation of the decrease in the contrast of objects of a place due to light scattering in the atmosphere p0042 A82-13633

LIMNOLOGY

Data sources for analyses of Great Lakes wetlands p0035 A82-10054

Remote sensing that motivated community action p0008 A82-12594

The operational use of Landsat for lake quality assessment p0036 A82-12596

LINEAR FILTERS
The MSS control point location error filter for LANDSAT-D p0051 N82-10073
LITHOSPHERE
Study of the time evolution of the lithosphere [NASA-CR-164968] p0016 N82-11696
The reduction, verification and interpretation of Magsat magnetic data over Canada [E82-10006] p0046 N82-15484
LOWER CALIFORNIA (MEXICO)
The use of satellite infrared imagery for describing ocean processes in relation to spawning of the northern anchovy /Engraulis mordax/ p0025 A82-17565
Geological features of southwestern North America p0020 N82-12495

M

MAGNETIC ANOMALIES
A closer examination of the reduction of satellite magnetometer data for geological studies p0019 A82-11039
The reduction, verification and interpretation of Magsat magnetic data over Canada [E82-10006] p0046 N82-15484
The mineralogy of global magnetic anomalies [E82-10009] p0021 N82-15487
MAGNETIC EFFECTS
Distant magnetic field effects associated with Birkeland currents /made possible by the evaluation of TRIAD's attitude oscillations/ p0015 A82-12215
MAGNETIC FIELDS
Magnetic field-aligned electron distributions in the dayside cusp p0015 A82-12186
MAGSAT: Vector magnetometer absolute sensor alignment determination [NASA-TM-79648] p0051 N82-10468
MAGNETIC MEASUREMENT
Magnetic field observations on DE-A and -B --- Dynamics Explorer A and B satellites p0051 A82-16447
MAGNETIC STORMS
Characteristics of westward travelling surges during magnetospheric substorms p0050 A82-14299
MAGNETIC SURVEYS
Use of hydromagnetic waves to map geomagnetic field lines p0016 A82-16868
Space techniques to monitor movements in the earth's crust p0016 A82-18797
Magnetic Field Satellite (Magsat) data processing system specifications [NASA-CR-166737] p0045 N82-11103
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York. Volume 1: Data acquisition, reduction and interpretation [DE82-000650] p0053 N82-14599
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000781] p0020 N82-14600
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000401] p0020 N82-14601
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000780] p0021 N82-14602
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000872] p0021 N82-14603
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000772] p0021 N82-14604
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000785] p0021 N82-14605
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000869] p0021 N82-14606
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000794] p0021 N82-14607
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000784] p0021 N82-14608
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada [DE81-029462] p0022 N82-15506
MAGNETOHYDRODYNAMIC WAVES
Use of hydromagnetic waves to map geomagnetic field lines p0016 A82-16868
MAGNETOMETERS
Magnetic field observations on DE-A and -B --- Dynamics Explorer A and B satellites p0051 A82-16447
MAGSAT: Vector magnetometer absolute sensor alignment determination [NASA-TM-79648] p0051 N82-10468
MAGNETOSPHERE
Characteristics of westward travelling surges during magnetospheric substorms p0050 A82-14299
Use of hydromagnetic waves to map geomagnetic field lines p0016 A82-16868
MAGSAT SATELLITES
Magnetic Field Satellite (Magsat) data processing system specifications [NASA-CR-166737] p0045 N82-11103
MAINE
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York. Volume 1: Data acquisition, reduction and interpretation [DE82-000650] p0053 N82-14599
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000781] p0020 N82-14600
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000401] p0020 N82-14601
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000780] p0021 N82-146C2
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000872] p0021 N82-14603
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000772] p0021 N82-14604
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000785] p0021 N82-14605
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000869] p0021 N82-14606
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000794] p0021 N82-14607
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000784] p0021 N82-14608
MALAYA
Vegetation patterns p0004 N82-12500
MAN ENVIRONMENT INTERACTIONS
Spacelab-research of European regions with strong negative environmental influences, based on AVHRR-data of the satellites Tiros-N and NOAA p0007 A82-12517
Study of the anthropogenic influence on the environment, based on multispectral scanning images p0008 A82-15965
Cultural features imaged and observed from Skylab 4 p0010 N82-12499
MAPPING
Digital image technology - MC&G impact --- Mapping, Charting, & Geodesy p0015 A82-10028
Applications of digital displays in photointerpretation and digital mapping p0041 A82-10038
Application of satellite Doppler techniques to the national mapping program p0015 A82-10056
Bureau of Land Management satellite Doppler positioning techniques p0015 A82-10057
Cost effective computer processing of airborne scanner data for regional level mapping p0043 A82-15970
Small-scale terrain mapping based on numerical interpretation of LANDSAT imagery [VTT-40] p0045 N82-10485
Reports of Planetary Geology Program, 1981 [NASA-TM-84211] p0016 N82-14041
The reduction, verification and interpretation of Magsat magnetic data over Canada [E82-10006] p0046 N82-15484
MAPS
A global atlas of GEOS-3 significant waveheight and comparison of the data with national buoy data p0026 N82-10660
MARINE BIOLOGY
Fisheries investigations and management benefits from remote sensing --- fish tracking p0030 N82-14559
MARINE ENVIRONMENTS
A marine environmental monitoring and assessment program p0027 N82-10663
Monitoring the Chesapeake Bay using satellite data for Superflux III p0027 N82-10668
A look at nonsatellite remote sensing systems for marine use --- together with satellite systems, overall view of the technology p0032 N82-14586
MARINE METEOROLOGY
An investigation of a polar low with a spiral cloud structure p0007 A82-10616
Analysis of SEASAT wind observations over the Indian Ocean p0023 A82-10671
Oceanic wind and balanced pressure-height fields derived from satellite measurements p0023 A82-13214
Upper tropospheric cyclonic vortices in the tropical South Atlantic p0009 A82-16325
Detection of monsoon inversion by TIROS-N satellite p0024 A82-17168
CTD/02 measurements during the Equatorial Pacific Ocean Climate Study (EPOCS) in 1979 [PB81-211203] p0026 N82-10461
The potential and requirements for space oceanography --- National Oceanic Satellite system and U.S. Navy requirements p0029 N82-14556
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing p0030 N82-14557
The Seasat commercial demonstration program p0030 N82-14561
Determination of surface wind speed from remotely measured whitecap coverage, a feasibility assessment p0030 N82-14565
Marine activities in Sweden for which remote sensing data may be of interest --- oceanography, weather forecasting, and analysis p0031 N82-14576
Scientific studies using Bhaskara satellite microwave radiometer (SAMIR) data: A short overview --- calibration of the instrument and its use in the study of oceanographic parameters p0032 N82-14587
GEM: A simple meteorological buoy with satellite telemetry p0053 N82-14779
Meteorological and oceanographic observations on board Netherlands lightvessels and the lightplatform 'Goeree' in the North Sea [KNMI-141-28] p0033 N82-15684
MARINE RESOURCES
Remote sensing contributions to the management of renewable resources p0055 A82-12530
Chesapeake Bay Plume Study: Superflux 1980 [NASA-CP-2188] p0026 N82-10661
Superflux I, II, and III experiment design: Remote sensing aspects p0027 N82-10664
Superflux I, II, and III experiment designs: Water sampling and analyses --- Chespeake Bay, environmental monitoring and remote sensing p0027 N82-10665
Application of the NASA airborne oceanographic lidar to the mapping of chlorophyll and other organic pigments p0027 N82-10684
Studies of the Indian continental shelf: Application of remote sensing data p0031 N82-14569
MARINE TRANSPORTATION
An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry p0030 N82-14564
MARKING
Development and evaluation of an automatic labeling technique for spring small grains [E82-10001] p0004 N82-15480
MARSHLANDS
Repetitive aerial photography for assessing marsh vegetation changes p0001 A82-10048
Use of visible and thermal satellite data to monitor an intermittently flooding marshland p0036 A82-15037
MASSACHUSETTS
Spectral atmospheric observations at Nantucket Island, May 7-14, 1981 [NASA-TM-83196] p0029 N82-14550
MATHEMATICAL MODELS
A mathematical model of an over-sea airborne UHF radio link p0049 A82-11406
A Swedish proposal for an EISCAT/GEOS-2 experiment --- geomagnetic field models [KGI-175] p0052 N82-10484
Ionospheric propagation correction modeling for satellite altimeters [NASA-CR-156881] p0052 N82-12447
Sensitivity analysis of a mesoscale moisture model [AD-A101528] p0012 N82-14590
Winterkill indicator model, Crop Condition Assessment Division (CCAD) data base interface driver, user's manual [E82-10014] p0005 N82-15492
Use of environmental satellite data for input to energy balance snowmelt models [PB81-227795] p0039 N82-15673
MEDITERRANEAN SEA
Requirements in pollution monitoring and coastal management p0030 N82-14558
Oil spills: Large scale monitoring by LANDSAT p0012 N82-14572
Operational use of remote sensing for coastal zone management and possible contribution of specialized satellites --- aerial photography p0031 N82-14574
MESOMETEOROLOGY
GEM: A simple meteorological buoy with satellite telemetry p0053 N82-14779
MESOSCALE PHENOMENA
Visual observations of the ocean p0028 N82-12502
Mesoscale wake clouds in Skylab photographs p0011 N82-12508
Mesoscale cloud features observed from Skylab p0011 N82-12509
Sensitivity analysis of a mesoscale moisture model [AD-A101528] p0012 N82-14590
METEORITE CRATERS
The Manicouagan impact structure observed from Skylab [CONTRIB-544] p0020 N82-12497
METEOROLOGICAL PARAMETERS
Two-dimensional model variability in thermal inertia surveys p0042 A82-15029
The determination of navigational and meteorological variables measured by NOAA/RFC WP3D aircraft [PB81-225468] p0028 N82-11743
METEOROLOGICAL RADAR
Analysis of bright bands from 3-D radar data --- for snow/rain delineation p0035 A82-10208
METEOROLOGY
Meteorological lab applications of Skylab handheld-camera photographs p0011 N82-12506
Analysis of satellite observations: Theoretical studies on the sampling problem [MITT-31] p0056 N82-15499
METEOSAT SATELLITE
Overall economic impact of an operational Meteosat system [ESA-CR(P)-1457] p0055 N82-13010
METHANE
Automated analyzer for aircraft measurements of atmospheric methane and total hydrocarbons p0007 A82-11949

MEXICO

Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] p0010 N82-11514

Global Tectonics: Some Geologic analyses of observations and photographs from Skylab
p0020 N82-12494

Geological features of southwestern North America
p0020 N82-12495

MICHIGAN

Introducing remote sensing to county-level agencies in Michigan through the Cooperative Extension Service
p0007 A82-10034

Data sources for analyses of Great Lakes wetlands
p0035 A82-10064

MICROORGANISMS

Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy
[PREPRINT-69] p0020 N82-12713

MICROWAVE EMISSION

A comparison of radiative transfer models for predicting the microwave emission from soils p0035 A82-10694

SMMR data set development for GARP --- impact of cross polarization and Faraday rotation on SMMR derived brightness temperatures
[NASA-CR-166721] p0052 N82-11512

MICROWAVE IMAGERY

An improvement in land cover classification achieved by merging microwave data with Landsat multispectral scanner data p0007 A82-10043

A preliminary evaluation of Seasat performance over the area of JASIN and its relevance to ERS-1
p0031 N82-14567

Visual Evaluation of E-SLAR imagery
[DFVLR-FB-81-11] p0047 N82-15503

MICROWAVE RADIOMETERS

Use of radar and microwave radiometry for reconnaissance satellites
[FOA-C-30204-E1] p0052 N82-10481

Microwave limb sounder --- measuring trace gases in the upper atmosphere
[NASA-CASE-NPO-14544-1] p0011 N82-12685

Scientific studies using Bhaskara satellite microwave radiometer (SAMIR) data: A short overview --- calibration of the instrument and its use in the study of oceanographic parameters p0032 N82-14587

MICROWAVE SCATTERING

Radiative transfer theory for passive microwave remote sensing of random media p0049 A82-11533

Reflectivity and emissivity of snow and ground at mm waves p0042 A82-14860

Ocean surface height-slope probability density function from SEASAT altimeter echo p0024 A82-15076

An analysis of short pulse and dual frequency radar techniques for measuring ocean wave spectra from satellites p0024 A82-15318

State-of-the-art in using a spaceborne altimeter and scatterometer for the determination of wind, sea state, and marine and ice dynamics --- Seasat instruments
p0052 N82-14560

MICROWAVE SENSORS

Technology transfer of NASA microwave remote sensing system
[NASA-CR-165791] p0028 N82-11515

Remote Sensing Information Bulletin: Issue number 6
p0053 N82-14616

MILLIMETER WAVES

Reflectivity and emissivity of snow and ground at mm waves p0042 A82-14860

MINERAL DEPOSITS

Deep Ocean Mining Environmental Study. Environmental effects of commercial-scale mining
[PB81-227753] p0029 N82-13484

MINERAL EXPLORATION

Statistical Techniques Applied to Aerial Radiometric Surveys (STAARS): Series introduction and the principal-components-analysis method --- National Uranium Resource Evaluation Program
[DE81-029177] p0019 N82-10476

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York. Volume 1: Data acquisition, reduction and interpretation
[DE82-000650] p0053 N82-14599

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000781] p0020 N82-14600

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000401] p0020 N82-14601

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000780] p0021 N82-14602

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000872] p0021 N82-14603

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000772] p0021 N82-14604

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000785] p0021 N82-14605

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000869] p0021 N82-14606

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000794] p0021 N82-14607

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000784] p0021 N82-14608

Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0021 N82-15489

An investigation into the applicability of thermal infrared scanning for exploration
[BMFT-FB-T-81-087] p0022 N82-15925

MINERALOGY

The mineralogy of global magnetic anomalies
[E82-10009] p0021 N82-15487

MINES (EXCAVATION)

A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10018] p0056 N82-15496

MINING

Deep Ocean Mining Environmental Study. Environmental effects of commercial-scale mining
[PB81-227753] p0029 N82-13484

MISSISSIPPI

A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10018] p0056 N82-15496

MISSOURI

Radiative heating rates and some optical properties of the St. Louis aerosol, as inferred from aircraft measurements p0008 A82-14320

MISSOURI RIVER BASIN (US)

The potential for use of Landsat data in water resources planning for the Missouri River Basin p0037 A82-18000

MODULATION TRANSFER FUNCTION

Wave orbital velocity, fade, and SAR response to azimuth waves p0023 A82-11203

MOISTURE CONTENT

Effect of grain size and snowpack water equivalence on visible and near-infrared satellite observations of snow
p0035 A82-12553

Remote sensing of crop moisture status
p0003 A82-17997

Progress in radar snow research --- Brookings, South Dakota
[NASA-CR-166709] p0038 N82-12510

MOLECULAR SPECTROSCOPY

Nitric oxide delta band emission in the earth's atmosphere Comparison of a measurement and a theory
p0008 A82-13268

MONSOONS

Detection of monsoon inversion by TIROS-N satellite
p0024 A82-17168

MOUNTAINS

Snow-mapping experiment p0037 N82-12498

Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] p0022 N82-15506

Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227795] p0039 N82-15673

MULTIPATH TRANSMISSION

A mathematical model of an over-sea airborne UHF radio link p0049 A82-11406

MULTISPECTRAL BAND CAMERAS

Main results of the Raduga experiment
p0051 A82-16602

MULTISPECTRAL BAND SCANNERS

Data compression and reconstruction for mixed resolution multispectral sensors p0049 A82-10045

Limitations in the spectral discrimination of the Landsat MSS p0001 A82-10046

Computational aspects of geometric correction data generation in the LANDSAT-D imagery processing
p0045 N82-10072

The MSS control point location error filter for LANDSAT-D p0051 N82-10073

MULTISPECTRAL PHOTOGRAPHY

Investigations concerning the image-controlled segmentation of objects in multispectral imagery data --- German thesis p0042 A82-15003

Experimental telemetry system based on the Fragment multispectral scanning system p0050 A82-15955

Study and mapping of agricultural land use, based on space images p0003 A82-15963

Airborne and spaceborne multispectral photography of the earth --- Russian book p0043 A82-16601

Main results of the Raduga experiment
p0051 A82-16602

Evaluation of the information content of the channels of spaceborne multispectral photography of the Fergana region by the MKF-6 camera from Soyuz-22
p0043 A82-16605

Geometric quality of MKF-6 photographs
p0043 A82-16606

Methods of instrumental interpretation of multispectral aerial and space photographs p0043 A82-16607

Characteristics of the photometry of small objects from aerial and space photographs p0044 A82-16616

Estimation of the brightness field from results of multispectral photography of the earth from space
p0044 A82-16617

Analog methods for processing multispectral photographs p0044 A82-16623

Processing of multispectral image data on special-purpose computer systems p0044 A82-16627

Programs for the statistical analysis of multispectral photographs p0044 A82-16628

Linear combinations of multispectral images
p0044 A82-16629

Coordinate referencing of MKF-6 photographs and their transformation to the cartographic projection
p0045 A82-16630

Identification of lithologic units using multichannel imaging systems p0046 N82-11509

Multitemporal calibration of LANDSAT images: A method for improving the marine phenomena recognition, with as example the Venice lagoon --- brightness/green/yellow feature space, image enhancement p0046 N82-14578

Mapping of surface currents in Greenland fiords by means of LANDSAT images --- multispectral photography
p0038 N82-14579

The use of LANDSAT MSS to observe sediment distribution and movement in the Solent coastal area --- multispectral scannel (MSS) p0038 N82-14580

Maritime applications of image processing at DFVLR, Oberpfaffenhofen, West Germany --- LANDSAT multispectral scanner images, digital interactive image analysis p0032 N82-14585

MULTIVARIATE STATISTICAL ANALYSIS

Statistical Techniques Applied to Aerial Radiometric Surveys (STAARS): Series introduction and the principal-components-analysis method --- National Uranium Resource Evaluation Program
[DE81-029177] p0019 N82-10476

Fiscal year 1980-81 implementation plan in support of technical development and integration of sampling and aggregation procedures --- crop acreage estimation
[E82-10013] p0005 N82-15491

N

NASA PROGRAMS

Reports of Planetary Geology Program, 1981
[NASA-TM-84211] p0016 N82-14041

NATIONAL OCEANIC SATELLITE SYSTEM

The potential and requirements for space oceanography --- National Oceanic Satellite system and U.S. Navy requirements p0029 N82-14556

NATIONAL SEVERE STORMS PROJECT

National Hurricane operations plan
[PB81-247231] p0013 N82-15697

NAVIGATION AIDS

The application of programmable pocket calculators for computations during survey flights p0050 A82-16164

NEAR INFRARED RADIATION

Effect of grain size and snowpack water equivalence on visible and near-infrared satellite observations of snow
p0035 A82-12553

The near-infrared radiation received by satellites from clouds p0025 A82-17492

NEARSHORE WATER

Synoptic thermal and oceanographic parameter distributions in the New York Bight Apex
p0023 A82-12885

NEBRASKA

Remote sensing of crop moisture status
p0003 A82-17997

The potential for use of Landsat data in water resources planning for the Missouri River Basin p0037 A82-18000

NEVADA

Estimation of atmospheric path-radiance by the covariance matrix method p0041 A82-10861

Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] p0022 N82-15506

NEW ENGLAND (US)

Meteorological lab applications of Skylab handheld-camera photographs p0011 N82-12506

NEW GUINEA (ISLAND)

Estimation of atmospheric path-radiance by the covariance matrix method p0041 A82-10861

NEW MEXICO

Environmental Monitoring Report, Sandia National Labs., Albuquerque, New Mexico, 180
[DE81-027839] p0010 N82-11649

Meteorological lab applications of Skylab handheld-camera photographs p0011 N82-12506

NEW YORK

Synoptic thermal and oceanographic parameter distributions in the New York Bight Apex
p0023 A82-12885

Role of remote sensing in the study of acid rain impact on aquatic systems
[AIAA PAPER 82-0336] p0036 A82-17892

Meteorological lab applications of Skylab handheld-camera photographs p0011 N82-12506

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York. Volume 1: Data acquisition, reduction and interpretation
[DE82-000650] p0053 N82-14599

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000781] p0020 N82-14600

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000401] p0020 N82-14601
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000780] p0021 N82-14602
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000794] p0021 N82-14607
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000784] p0021 N82-14608

NEW ZEALAND
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab
p0020 N82-12494
Vegetation patterns p0004 N82-12500

NITRIC OXIDE
Nitric oxide delta band emission in the earth's atmosphere Comparison of a measurement and a theory
p0008 A82-13268

NORTH AMERICA
Availability of Seasat synthetic aperture radar imagery
p0050 A82-15039
Geological features of southwestern North America
p0020 N82-12495
Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Femandian Caldera, Galapagos Islands, Ecuador
p0020 N82-12496

NORTH CAROLINA
Satellite imagery and shoreline erosion prediction
p0036 A82-12595
Aircraft data summaries of the SURE intensives, volume 4
[DE82-900311] p0012 N82-13569

NORTH SEA
An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry p0030 N82-14564
Coastal zone research using remote sensing techniques --- calibration of coastal zone color scanner
p0031 N82-14571
Project Noordwijk. Part 1: Measurements of the radar backscatter coefficient gamma (sigma deg) in 1977 and 1978 --- on a sea platform
[PHL-1979-49-PT-1] p0032 N82-14617
Project Noordwijk. Part 2: Results of North Sea clutter measurements in the I-band performed from the platform Noordwijk in September/October 1977
[PHL-1980-28-PT-2] p0033 N82-14618
Meteorological and oceanographic observations on board Netherlands lightvessels and the lightplatform 'Goeree' in the North Sea
[KNMI-141-28] p0033 N82-15684

NORWAY
The Norwegian remote sensing experiment (Norsex) in a marginal ice zone p0031 N82-14566

O

OCEAN BOTTOM
Deep Ocean Mining Environmental Study. Environmental effects of commercial-scale mining
[PB81-227753] p0029 N82-13484
Operational use of remote sensing for coastal zone management and possible contribution of specialized satellites --- aerial photography p0031 N82-14574

OCEAN COLOR SCANNER
Preliminary analysis of ocean color scanner data from Superflux III p0027 N82-10672

OCEAN CURRENTS
The observation of tidal patterns, currents, and bathymetry with SLAR imagery of the sea
p0023 A82-11201
A short review of an oceanographic use of Meteosat data by the ORSTOM remote sensing service
p0031 N82-14570
Marine activities in Sweden for which remote sensing data may be of interest --- oceanography, weather forecasting, and analysis p0031 N82-14576

OCEAN DATA ACQUISITIONS SYSTEMS
U.S. Navy planning for satellite oceanographic data exploitation
[AAS 81-072] p0024 A82-16341
Technology transfer of NASA microwave remote sensing system
[NASA-CR-165791] p0028 N82-11515
The need for integrated off-shore, real-time information and management systems p0055 N82-14555
The potential and requirements for space oceanography --- National Oceanic Satellite system and U.S. Navy requirements p0029 N82-14556
Requirements in pollution monitoring and coastal management p0030 N82-14558
A look at nonsatellite remote sensing systems for marine use --- together with satellite systems, overall view of the technology p0032 N82-14586
GEM: A simple meteorological buoy with satellite telemetry p0053 N82-14779

OCEAN DYNAMICS
Surface signs of internal ocean dynamics
[AD-A101380] p0029 N82-13642
State-of-the-art in using a spaceborne altimeter and scatterometer for the determination of wind, sea state, and marine and ice dynamics --- Seasat instruments
p0052 N82-14560

OCEAN SURFACE
Analysis of SEASAT wind observations over the Indian Ocean p0023 A82-10671
Wave orbital velocity, fade, and SAR response to azimuth waves p0023 A82-11203
Water vapour absorption in the 3.5-4.2 micron atmospheric window p0023 A82-14586
Radar backscattering from ocean waves at low grazing angles p0023 A82-14730
Ocean surface height-slope probability density function from SEASAT altimeter echo p0024 A82-15076
Determination of the length of sea waves by an airborne radar technique p0024 A82-15213
An analysis of short pulse and dual frequency radar techniques for measuring ocean wave spectra from satellites p0024 A82-15318
Investigation of survey conditions for the ocean surface in the 0.4-1.1 micron spectral range p0024 A82-15960
Clear water radiances for atmospheric correction of coastal zone color scanner imagery p0025 A82-17292
The near-infrared radiation received by satellites from clouds p0025 A82-17492
Variations in upper ocean heat storage determined from satellite data p0025 A82-17567
Measurement of sea and ice backscatter reflectivity using an OTH radar system p0025 A82-18074
Seasat altimetry adjustment model including tidal and other sea surface effects
[AD-A104188] p0026 N82-10473
A global atlas of GEOS-3 significant waveheight and comparison of the data with national buoy data
p0026 N82-10660
Surface signs of internal ocean dynamics
[AD-A101380] p0029 N82-13642
Determination of surface wind speed from remotely measured whitecap coverage, a feasibility assessment
p0030 N82-14565
A preliminary evaluation of Seasat performance over the area of JASIN and its relevance to ERS-1
p0031 N82-14567
Oil spills: Large scale monitoring by LANDSAT
p0012 N82-14572
Airborne remote sensing of the coastal zone
p0053 N82-14577
Multitemporal calibration of LANDSAT images: A method for improving the marine phenomena recognition, with as example the Venice lagoon --- brightness/green/yellow feature space, image enhancement p0046 N82-14578
The feasibility of using remotely sensed color as an index of Irish coastal water properties --- statistical correlation of sea truth data p0032 N82-14581
Project Noordwijk. Part 1: Measurements of the radar backscatter coefficient gamma (sigma deg) in 1977 and 1978 --- on a sea platform
[PHL-1979-49-PT-1] p0032 N82-14617
Project Noordwijk. Part 2: Results of North Sea clutter measurements in the I-band performed from the platform Noordwijk in September/October 1977
[PHL-1980-28-PT-2] p0033 N82-14618
Remote sensing of sea state by laser altimeters
[NASA-CR-165049] p0033 N82-14789

OCEAN TEMPERATURE
Comparison of polar and geostationary satellite infrared observations of sea surface temperatures in the Gulf of Maine p0024 A82-15030
Detection of monsoon inversion by TIROS-N satellite
p0024 A82-17168
The use of satellite infrared imagery for describing ocean processes in relation to spawning of the northern anchovy /Engraulis mordax/ p0025 A82-17565
ICAPS oceanographic data for the Indian Ocean
[AD-A103173] p0029 N82-13641

OCEANOGRAPHIC PARAMETERS
Fisheries investigations and management benefits from remote sensing --- fish tracking p0030 N82-14559

OCEANOGRAPHY
SAR imaging of ocean waves - Theory
p0023 A82-11202
Synoptic thermal and oceanographic parameter distributions in the New York Bight Apex
p0023 A82-12885
Investigation of survey conditions for the ocean surface in the 0.4-1.1 micron spectral range p0024 A82-15960
Study on satellite radar altimetry in climatological and oceanographic research, volume 1
[SP/153/06/01/FR(80)-VOL-1] p0026 N82-10486
Study on satellite radar altimetry in climatological and oceanographic research, volume 2
[SP/153/06/01FR(80)-VOL-2] p0026 N82-10487
Application of the NASA airborne oceanographic lidar to the mapping of chlorophyll and other organic pigments
p0027 N82-10684
Assessment of Superflux relative to remote sensing --- airborne remote sensing of the Chesapeake Bay plume and shelf regions p0028 N82-10694
Visual observations of the ocean p0028 N82-12502
An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs p0028 N82-12503
Boundary detection criteria for satellite altimeters
[NASA-CR-156880] p0028 N82-12734
The SACLANTCEN oceanographic data base. Volume 1: Design criteria and data structure and content
[AD-A103277] p0029 N82-13639
ICAPS oceanographic data for the Indian Ocean
[AD-A103173] p0029 N82-13641
Application of remote sensing data on the continental shelf: Proceedings of an EAReL-ESA Symposium
[ESA-SP-167] p0029 N82-14553
ERS-1: Mission objectives and system concept
p0029 N82-14554
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0030 N82-14557
An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry p0030 N82-14564
Studies of the Indian continental shelf: Application of remote sensing data p0031 N82-14569
Scientific studies using Bhaskara satellite microwave radiometer (SAMIR) data: A short overview --- calibration of the instrument and its use in the study of oceanographic parameters p0032 N82-14587
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156882] p0033 N82-15498
Biological patchiness in relation to satellite thermal imagery and associated chemical mesoscale features
[AD-A105757] p0047 N82-15504
Meteorological and oceanographic observations on board Netherlands lightvessels and the lightplatform 'Goeree' in the North Sea
[KNMI-141-28] p0033 N82-15684

OFFSHORE ENERGY SOURCES
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0030 N82-14557
The Seasat commercial demonstration program
p0030 N82-14561

OHIO
Aircraft data summaries of the SURE intensives, volume 4
[DE82-900311] p0012 N82-13569

OIL EXPLORATION
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0030 N82-14557
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0021 N82-15489

OIL POLLUTION
Oil spills: Large scale monitoring by LANDSAT
p0012 N82-14572
The operational oil pollution surveillance system being used in France: Forecasted future developments in consideration of the NATO/CCMS remote sensing pilot study conclusions p0012 N82-14573
Use of Side Looking Airborne Radar (SLAR) for oil pollution monitoring in Norway p0012 N82-14588

OIL SLICKS
Polarimetric surveys of oil slicks p0009 A82-16619
A recommended sensor package for the detection and tracking of oil spills p0053 N82-14563

OKLAHOMA
Mapping vegetation association boundaries with Landsat MSS data - An Oklahoma example p0001 A82-10041

ONBOARD DATA PROCESSING
Application of satellite Doppler techniques to the national mapping program p0015 A82-10056
GPS application to mapping, charting and geodesy
p0015 A82-10645
Onboard utilization of ground control points for image correction. Volume 2: Analysis and simulation results
[NASA-CR-166732] p0045 N82-10470
Onboard utilization of ground control points for image correction. Volume 3: Ground control point simulation software design
[NASA-CR-166733] p0045 N82-10471
Onboard utilization of ground control points for image correction. Volume 4: Correlation analysis software design
[NASA-CR-166734] p0045 N82-10472

OPERATIONAL PROBLEMS
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10005] p0053 N82-15483
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] p0054 N82-15495

OPTICAL CORRECTION PROCEDURE

A new method for computing distortion p0016 A82-12914

OPTICAL EQUIPMENT

Study on calibration methods for Earth observation optical imaging instruments [UCD-207/1/80] p0052 N82-10488

OPTICAL PATHS

Estimation of atmospheric path-radiance by the covariance matrix method p0041 A82-10861

OPTICAL POLARIZATION

Analysis of the information content of the polarimetric method of remote sensing p0003 A82-16822

OPTICAL RADAR

Application of the NASA airborne oceanographic lidar to the mapping of chlorophyll and other organic pigments p0027 N82-10684

OSTA-1 PAYLOAD

Mission operation report: OSTA-1 [NASA-TM-84053] p0055 N82-10102

OVER-THE-HORIZON RADAR

Measurement of sea and ice backscatter reflectivity using an OTH radar system p0025 A82-18074

OXYGEN

CTD/02 measurements during the Equatorial Pacific Ocean Climate Study (EPOCS) in 1979 [PB81-211203] p0026 N82-10461

OZONOMETRY

Trace pollutant concentrations in a multiday smog episode in the California South Coast Air Basin by long path length Fourier transform infrared spectroscopy p0007 A82-10700

Special observations by the Hohenpeissenberg Meteorological Observatory. Number 42: Results of aerological and surface ozone measurements during the first semester of 1980 [SONDERBEOB-42] p0012 N82-12714

P

PACIFIC OCEAN

Oceanic wind and balanced pressure-height fields derived from satellite measurements p0023 A82-13214

Global satellite measurements of water vapour, wind speed and wave height p0051 A82-17165

Annual and nonseasonal variability of monthly low-level wind fields over the Southeastern Tropical Pacific p0025 A82-17494

The use of satellite infrared imagery for describing ocean processes in relation to spawning of the northern anchovy /Engraulis mordax/ p0025 A82-17565

CTD/02 measurements during the Equatorial Pacific Ocean Climate Study (EPOCS) in 1979 [PB81-211203] p0026 N82-10461

An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs p0028 N82-12503

Deep Ocean Mining Environmental Study: Environmental effects of commercial-scale mining [PB81-227753] p0029 N82-13484

An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry p0030 N82-14564

PARAMETER IDENTIFICATION

Absolute image registration for geosynchronous satellites p0049 A82-10051

PATENT POLICY

Microwave limb sounder --- measuring trace gases in the upper atmosphere [NASA-CASE-NPO-14544-1] p0011 N82-12685

PATTERN RECOGNITION

American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers p0041 A82-10027

Digital image technology - MC&G impact --- Mapping, Charting, & Geodesy p0015 A82-10028

Investigations concerning the image-controlled segmentation of objects in multispectral imagery data --- German thesis p0042 A82-15003

The use of a priori information in the remote sensing of the earth from space p0044 A82-16618

Identification of lithologic units using multichannel imaging systems p0046 N82-11509

Vegetation patterns p0004 N82-12500

Development and evaluation of an automatic labeling technique for spring small grains [E82-10001] p0004 N82-15480

Wheat cultivation: Identification and estimation of areas using LANDSAT data [E82-10007] p0004 N82-15485

PATTERN REGISTRATION

An improvement in land cover classification achieved by merging microwave data with Landsat multispectral scanner data p0007 A82-10043

Absolute image registration for geosynchronous satellites p0049 A82-10051

PAYLOADS

LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979 [E82-10005] p0053 N82-15483

LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979 [E82-10017] p0054 N82-15495

PENNSYLVANIA

Comparison of conventional and remotely sensed estimates of runoff curve numbers in southeastern Pennsylvania p0035 A82-10031

Estimation of atmospheric path-radiance by the covariance matrix method p0041 A82-10861

PETROGRAPHY

The mineralogy of global magnetic anomalies [E82-10009] p0021 N82-15487

PHENOLOGY

The discrimination of winter wheat using a growth-state signature p0002 A82-15026

US/Canada wheat and barley crop calender exploratory experiment implementation plan [E82-10016] p0005 N82-15494

PHILIPPINES

Rural development in the humid tropics p0003 A82-16162

PHOTOGEOLOGY

Remote sensing study of sinkhole occurrence p0019 A82-12590

Development of a coastal relief of the Gulf of Riga, based on results of an analysis of space images p0024 A82-15962

Investigation and mapping of the erosion relief of the Kalachskaia upland on the basis of multispectral scanner images p0008 A82-15966

Space techniques to monitor movements in the earth's crust p0016 A82-18797

Geology and linears of Libya p0019 N82-10618

Remote sensing studies of some ironstone gravels and plinthite in Thailand p0019 N82-12491

Skylab explores the Earth [NASA-SP-380] p0019 N82-12492

Global Tectonics: Some Geologic analyses of observations and photographs from Skylab p0020 N82-12494

Geological features of southwestern North America p0020 N82-12495

Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador p0020 N82-12496

The Manicouagan impact structure observed from Skylab [CONTRIB-544] p0020 N82-12497

PHOTOGRAMMETRY

American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers p0041 A82-10027

Orientation and construction of models. I - The orientation problem in close-range photogrammetry p0049 A82-10858

Digital mapping using entities - A new concept p0041 A82-12882

Phototriangulation with map referencing of photographs in linear surveys p0016 A82-12912

Aspects in the development of aerial-photography tasks p0041 A82-12913

Block adjustment with additional parameters p0049 A82-13738

Compensation of systematic errors in bundle adjustment p0042 A82-15764

Compensation of systematic errors of image and model coordinates p0043 A82-15765

Orientation and construction of models. III - Mathematical basis of the orientation problem of one-dimensional central perspective photographs p0043 A82-15973

Theoretical reliability of elementary photogrammetric procedures. I p0043 A82-16163

Geometric quality of MKF-6 photographs p0043 A82-16606

A history of flying and photography. In the Photogrammetry Division of the National Ocean Survey 1919 - 1979 [PB81-246738] p0017 N82-15520

Description and comparison of algorithms for solving large sets of sparse matrix normal equations in geodesy and photogrammetry [SER-C-281] p0017 N82-15812

PHOTOINTERPRETATION

Applications of digital displays in photointerpretation and digital mapping p0041 A82-10038

Remote sensing for vineyard management p0001 A82-10047

Repetitive aerial photography for assessing marsh vegetation changes p0001 A82-10048

Identification of conifer species groupings from Landsat digital classifications p0002 A82-12887

Interactive techniques for estimating precipitation from GOES imagery p0041 A82-13121

Investigations concerning the image-controlled segmentation of objects in multispectral imagery data --- German thesis p0042 A82-15003

The discrimination of winter wheat using a growth-state signature p0002 A82-15026

Space photographs obtained with the Fragment system as a base for landscape mapping and physical-geographical classification of arid territories p0009 A82-15967

Airborne and spaceborne multispectral photography of the earth --- Russian book p0043 A82-16601

Main results of the Raduga experiment p0051 A82-16602

Methods of instrumental interpretation of multispectral aerial and space photographs p0043 A82-16607

The maximum mean accuracy of classification of remote-sensing objects and the influence on this accuracy of data acquisition and processing methods p0044 A82-16615

Characteristics of the photometry of small objects from aerial and space photographs p0044 A82-16616

The use of a priori information in the remote sensing of the earth from space p0044 A82-16618

Analog methods for processing multispectral photographs p0044 A82-16623

Investigation of the spatial structure of space images of the earth's surface p0044 A82-16626

Processing of multispectral image data on special-purpose computer systems p0044 A82-16627

Linear combinations of multispectral images p0044 A82-16629

A method for using aerial photos in delineating historic patterns of beach accretion and retreat [PB81-223836] p0010 N82-11536

Skylab explores the Earth [NASA-SP-380] p0019 N82-12492

Visual observations of floating ice from Skylab p0037 N82-12504

Mesoscale wake clouds in Skylab photographs p0011 N82-12508

Mesoscale cloud features observed from Skylab p0011 N82-12509

Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images [E82-10008] p0039 N82-15486

Visual Evaluation of E-SLAR imagery [DFVLR-FB-81-11] p0047 N82-15503

PHOTOMAPPING

Comparison of conventional and remotely sensed estimates of runoff curve numbers in southeastern Pennsylvania p0035 A82-10031

Data sources for analyses of Great Lakes wetlands p0035 A82-10054

GPS application to mapping, charting and geodesy p0015 A82-10645

Digitizing and automated output mapping errors p0015 A82-10859

Coordinates of features on the Galilean satellites p0019 A82-12366

Areawide soil loss predictions using CIR airphotos p0007 A82-12591

Satellite imagery and shoreline erosion prediction p0036 A82-12595

Digital mapping using entities - A new concept p0041 A82-12882

Phototriangulation with map referencing of photographs in linear surveys p0016 A82-12912

Aerial and space methods in cartography p0016 A82-12915

Investigations concerning the image-controlled segmentation of objects in multispectral imagery data --- German thesis p0042 A82-15003

A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras p0003 A82-15748

Aerial-photography flights over Upper Franconia in 1980 - Operation and first application-related experience p0008 A82-15749

Study and mapping of agricultural land use, based on space images p0003 A82-15963

Mapping of forest vegetation on the basis of space images p0003 A82-15964

Study of the anthropogenic influence on the environment, based on multispectral scanning images p0008 A82-15965

Space photographs obtained with the Fragment system as a base for landscape mapping and physical-geographical classification of arid territories p0009 A82-15967

Analysis of variance of thematic mapping experiment data p0009 A82-15968

Orientation and construction of models. III - Mathematical basis of the orientation problem of one-dimensional central perspective photographs p0043 A82-15973

Coordinate referencing of MKF-6 photographs and their transformation to the cartographic projection p0045 A82-16630

The development of the Tiros Global Environmental Satellite System [AIAA PAPER 82-0383] p0025 A82-17915

The use of digitally processed Landsat imagery for vegetation mapping in Sulawesi, Indonesia p0003 A82-17998

An inertially-aided aircraft track recovery system for coastal mapping p0037 A82-18166

Photo inertial positioning system development at the Canada Centre for Remote Sensing p0045 A82-18167

Large-scale color aerial photography as a tool in sampling for mortality rates [PB81-214777] p0003 N82-10489

Desert sand seas p0020 N82-12493

Snow-mapping experiment p0037 N82-12498

An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs p0028 N82-12503

Mapping of surface currents in Greenland fiords by means of LANDSAT images --- multispectral photography p0038 N82-14579

PHOTOMETRY
Characteristics of the photometry of small objects from aerial and space photographs p0044 A82-16616

PHOTORECONNAISSANCE
Current aerial cameras p0050 A82-15655
Quantitative analysis of atmospheric pollution phenomena p0010 N82-12505
Some aspects of tropical storm structure revealed by handheld-camera photographs from space p0011 N82-12507

PLAINS
Investigation and mapping of the erosion relief of the Kalachskaia upland on the basis of multispectral scanner images p0008 A82-15966

PLANETARY GEOLOGY
Reports of Planetary Geology Program, 1981 [NASA-TM-84211] p0016 N82-14041

PLANKTON
Development of the coastal zone color scanner for NIMBUS 7. Volume 1: Mission objectives and instrument description [NASA-CR-166720-VOL-1] p0028 N82-11511
Spectral atmospheric observations at Nantucket Island, May 7-14, 1981 [NASA-TM-83196] p0029 N82-14550
The color of the sea and its relation to surface chlorophyll and depth of the euphotic zone p0030 N82-14562
The feasibility of using remotely sensed color as an index of Irish coastal water properties --- statistical correlation of sea truth data p0032 N82-14581

PLANT STRESS
Remote sensing of crop moisture status p0003 A82-17997
Investigation of the application of remote sensing technology to environmental monitoring [E82-10010] p0013 N82-15488

PLANTS (BOTANY)
Phytoecozonation of Sevier Lake region of Utah using digitized Landsat MSS data p0001 A82-10042

POLAR CAPS
The ice conditions in the Greenland waters [ISBN-87-7478-183-9] p0028 N82-12533

POLAR METEOROLOGY
An investigation of a polar low with a spiral cloud structure p0007 A82-10616

POLAR REGIONS
ERS-1: Mission objectives and system concept p0029 N82-14554

POLARIMETRY
Polarimetric surveys of oil slicks p0009 A82-16619
Images of sea waves obtained in polarimetric surveys p0024 A82-16620
The choice of the orientation of the analyzer in polarimetric surveys p0044 A82-16621
Analysis of the information content of the polarimetric method of remote sensing p0003 A82-16622

POLARIZATION
Aircraft radar response to soil moisture p0003 A82-17564

POLLUTION MONITORING
Trace pollutant concentrations in a multiday smog episode in the California South Coast Air Basin by long path length Fourier transform infrared spectroscopy p0007 A82-10700
Automated analyzer for aircraft measurements of atmospheric methane and total hydrocarbons p0007 A82-11949
Spacelab-research of European regions with strong negative environmental influences, based on AVHRR-data of the satellites Tiros-N and NOAA p0007 A82-12517
Remote sensing that motivated community action p0008 A82-12594
Study of stack emissions by combination of lidar and correlation spectrometer p0008 A82-12816
Polarimetric surveys of oil slicks p0009 A82-16619
A new method for inferring carbon monoxide concentrations from gas filter radiometer data p0009 A82-16837
Role of remote sensing in the study of acid rain impact on aquatic systems [AIAA PAPER 82-0336] p0036 A82-17892
Shuttle applications in tropospheric air quality observations [NASA-CR-145374] p0010 N82-11635
Proof of concept study [AD-A104338] p0010 N82-11639
Quantitative analysis of atmospheric pollution phenomena p0010 N82-12505
Geophysical monitoring for climatic change, number 8: Summary Report, 1979 [PB81-233355] p0012 N82-13631
Application of remote sensing data on the continental shelf: Proceedings of an EAReL-ESA Symposium [ESA-SP-167] p0029 N82-14553
Requirements in pollution monitoring and coastal management p0030 N82-14558
A recommended sensor package for the detection and tracking of oil spills p0053 N82-14563
Studies of the Indian continental shelf: Application of remote sensing data p0031 N82-14569
Oil spills: Large scale monitoring by LANDSAT p0012 N82-14572
The operational oil pollution surveillance system being used in France: Forecasted future developments in consideration of the NATO/CCMS remote sensing pilot study conclusions p0012 N82-14573
Airborne remote sensing of the coastal zone p0053 N82-14577
Multitemporal calibration of LANDSAT images: A method for improving the marine phenomena recognition, with as example the Venice lagoon --- brightness/green/yellow feature space, image enhancement p0046 N82-14578
Use of Side Looking Airborne Radar (SLAR) for oil pollution monitoring in Norway p0012 N82-14588
Investigation of the application of remote sensing technology to environmental monitoring [E82-10010] p0013 N82-15488

POLLUTION TRANSPORT
Results from the July 1981 Workshop on Passive Remote Sensing of the Troposphere [AIAA PAPER 82-0207] p0009 A82-17841

POSITION (LOCATION)
Interpolating for the location of remote sensor data [NASA-TM-82169] p0052 N82-13469

POSITION ERRORS
Digitizing and automated output mapping errors p0015 A82-10859
Some problem areas in the field of quality control for aerotriangulation p0016 A82-16161
Theoretical reliability of elementary photogrammetric procedures. I p0043 A82-16163

POSITION INDICATORS
Photo inertial positioning system development at the Canada Centre for Remote Sensing p0045 A82-18167

PRECIPITATION (METEOROLOGY)
Interactive techniques for estimating precipitation from GOES imagery p0041 A82-13121
A simulation study of the recession coefficient for antecedent precipitation index --- soil moisture and water runoff estimation [NASA-TM-83860] p0038 N82-14549
The effect of spatial variability in precipitation on streamflow [AD-A105955] p0038 N82-14589

PREDICTION ANALYSIS TECHNIQUES
A comparison of radiative transfer models for predicting the microwave emission from soils p0035 A82-10694

PROJECT PLANNING
U.S. Navy planning for satellite oceanographic data exploitation [AAS 81-072] p0024 A82-16341

Q

QUALITY CONTROL
Some problem areas in the field of quality control for aerotriangulation p0016 A82-16161

QUEBEC
The Manicouagan impact structure observed from Skylab [CONTRIB-544] p0020 N82-12497

R

RADAR ATTENUATION
Radar correlation with ice depolarization measurements of the 28.56 GHz COMSTAR beacon and associated cross polarization statistics [NASA-CR-166717] p0046 N82-14548

RADAR BEACONS
Radar correlation with ice depolarization measurements of the 28.56 GHz COMSTAR beacon and associated cross polarization statistics [NASA-CR-166717] p0046 N82-14548

RADAR DATA
Analysis of bright bands from 3-D radar data --- for snow/rain delineation p0035 A82-10208

RADAR ECHOES
The influence of gravity waves on radiometric measurements - A case study p0049 A82-13547
Study on satellite radar altimetry in climatological and oceanographic research, volume 1 [SP/153/06/01/FR(80)-VOL-1] p0026 N82-10486
Study on satellite radar altimetry in climatological and oceanographic research, volume 2 [SP/153/06/01FR(80)-VOL-2] p0026 N82-10487

RADAR IMAGERY
Factorial analysis of terrain feature positioning parameters used in combining radar and digital terrain model data p0015 A82-10029
Remote sensing techniques in the study of the agricultural potential of soils under the Cerrado vegetation /Brazil/ p0001 A82-10040
Preliminary results of mapping urban land cover with Seasat SAR imagery p0007 A82-10044
The observation of tidal patterns, currents, and bathymetry with SLAR imagery of the sea p0023 A82-11201
SAR imaging of ocean waves - Theory p0023 A82-11202
Wave orbital velocity, fade, and SAR response to azimuth waves p0023 A82-11203
A digital fast correlation approach to produce SEASAT SAR imagery p0042 A82-14870
Availability of Seasat synthetic aperture radar imagery p0050 A82-15039
Optically processed Seasat radar mosaic of Florida p0042 A82-15125
A preliminary evaluation of Seasat performance over the area of JASIN and its relevance to ERS-1 p0031 N82-14567
Seasat SAR processing at the Norwegian Defence Research Establishment --- design and operation of a digital process p0046 N82-14584
Visual Evaluation of E-SLAR imagery [DFVLR-FB-81-11] p0047 N82-15503

RADAR MAPS
Radar mapping, archaeology, and ancient land use in the Maya lowlands [NASA-CR-164931] p0010 N82-11514

RADAR MEASUREMENT
Determination of the length of sea waves by an airborne radar technique p0024 A82-15213
An analysis of short pulse and dual frequency radar techniques for measuring ocean wave spectra from satellites p0024 A82-15318
Measurement of sea and ice backscatter reflectivity using an OTH radar system p0025 A82-18074

RADAR RESOLUTION
Additional studies of Earth resources synthetic aperture radar payloads [MTR-80/90] p0054 N82-15500
New baseline system p0054 N82-15501
Squinted SAR system p0047 N82-15502

RADAR SCATTERING
Radar backscattering from ocean waves at low grazing angles p0023 A82-14730
Aircraft radar response to soil moisture p0003 A82-17564
Measurement of sea and ice backscatter reflectivity using an OTH radar system p0025 A82-18074
Anomalous wind estimates from the Seasat scatterometer p0026 A82-18724
Progress in radar snow research --- Brookings, South Dakota [NASA-CR-166709] p0038 N82-12510
Project Noordwijk. Part 1: Measurements of the radar backscatter coefficient gamma (sigma deg) in 1977 and 1978 --- on a sea platform [PHL-1979-49-PT-1] p0032 N82-14617
Project Noordwijk. Part 2: Results of North Sea clutter measurements in the I-band performed from the platform Noordwijk in September/October 1977 [PHL-1980-28-PT-2] p0033 N82-14618

RADAR SIGNATURES
The determination of navigational and meteorological variables measured by NOAA/RFC WP3D aircraft [PB81-225468] p0028 N82-11743
Measurements of radar backscatter from Arctic Sea ice in the summer [AD-A105586] p0032 N82-14592
Measurements of radar backscatter from Arctic Sea ice in the summer. Appendices A and B [AD-A105736] p0032 N82-14593

RADAR TRACKING
The operational oil pollution surveillance system being used in France: Forecasted future developments in consideration of the NATO/CCMS remote sensing pilot study conclusions p0012 N82-14573

RADIANCE
Limitations in the spectral discrimination of the Landsat MSS p0001 A82-10046
Estimation of atmospheric path-radiance by the covariance matrix method p0041 A82-10861
Clear water radiances for atmospheric correction of coastal zone color scanner imagery p0025 A82-17292
The near-infrared radiation received by satellites from clouds p0025 A82-17492
Infrared radiance model variation by sensor flight measurements p0052 N82-14171

RADIATION ABSORPTION
Water vapour absorption in the 3.5-4.2 micron atmospheric window p0023 A82-14586

RADIATIVE HEAT TRANSFER
Radiative heating rates and some optical properties of the St. Louis aerosol, as inferred from aircraft measurements p0008 A82-14320

RADIATIVE TRANSFER
A comparison of radiative transfer models for predicting the microwave emission from soils p0035 A82-10694
Radiative transfer theory for passive microwave remote sensing of random media p0049 A82-11533
An evaluation of the spatial resolution of soil moisture information [NASA-CR-166724] p0009 N82-11513

RADIO ALTIMETERS
Ocean surface height-slope probability density function from SEASAT altimeter echo p0024 A82-15076
Seasat altimetry adjustment model including tidal and other sea surface effects [AD-A104188] p0026 N82-10473
Study on satellite radar altimetry in climatological and oceanographic research, volume 1 [SP/153/06/01/FR(80)-VOL-1] p0026 N82-10486
Study on satellite radar altimetry in climatological and oceanographic research, volume 2 [SP/153/06/01FR(80)-VOL-2] p0026 N82-10487

State-of-the-art in using a spaceborne altimeter and scatterometer for the determination of wind, sea state, and marine and ice dynamics --- Seasat instruments p0052 N82-14560

RADIO ATTENUATION
The radiowave propagation environment - Science and technology objectives for the 80's p0009 A82-18052

RADIO DIRECTION FINDERS
Three bearing method for passive triangulation in systems with unknown deterministic biases p0060 A82-15920

RADIO RELAY SYSTEMS
A mathematical model of an over-sea airborne UHF radio link p0049 A82-11406

RADIOACTIVE CONTAMINANTS
Environmental Monitoring Report, Sandia National Labs., Albuquerque, New Mexico, 180
[DE81-027838] p0010 N82-11649

RADIOMETRIC CORRECTION
Clear water radiances for atmospheric correction of coastal zone color scanner imagery p0025 A82-17292

RADIOMETRIC RESOLUTION
The effect of angular factors on popularly used indicators of vegetative vigor p0001 A82-10039
Data compression and reconstruction for mixed resolution multispectral sensors p0049 A82-10045
The influence of gravity waves on radiometric measurements - A case study p0049 A82-13547
Onboard utilization of ground control points for image correction. Volume 2: Analysis and simulation results
[NASA-CR-166732] p0045 N82-10470
Recent work in passive optical imaging of water --- space and aircraft derived data p0038 N82-14575
Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227795] p0039 N82-15673

RADIOTELEPHONES
A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras p0003 A82-15748

RAIN
Satellite rainfall estimation for hydrologic forecasting p0035 A82-10032
Analysis of bright bands from 3-D radar data --- for snow/rain delineation p0035 A82-10208
An evaluation of the spatial resolution of soil moisture information
[NASA-CR-166724] p0009 N82-11513
A systems approach to the real-time runoff analysis with a deterministic rainfall-runoff model
[PB81-224495] p0037 N82-11530
Scientific studies using Bhaskara satellite microwave radiometer (SAMIR) data: A short overview --- calibration of the instrument and its use in the study of oceanographic parameters p0032 N82-14587
Analysis of rainfall from flash flood producing thunderstorms, using GOES data p0038 N82-14724

RANGELANDS
Remote sensing contributions to the management of renewable resources p0055 A82-12530
Vegetation patterns p0004 N82-12500

RAYLEIGH SCATTERING
A theory of wave scattering from an inhomogeneous layer with an irregular interface p0041 A82-12757

RECLAMATION
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10018] p0056 N82-15496

RECONNAISSANCE AIRCRAFT
The determination of navigational and meteorological variables measured by NOAA/RFC WP3D aircraft
[PB81-225408] p0028 N82-11743

REFLECTANCE
Effect of grain size and snowpack water equivalence on visible and near-infrared satellite observations of snow p0035 A82-12553
Oil spills: Large scale monitoring by LANDSAT p0012 N82-14572

REGIONAL PLANNING
Introducing remote sensing to county-level agencies in Michigan through the Cooperative Extension Service p0007 A82-10034
Aerial-photography flights over Upper Franconia in 1980 Operation and first application-related experience p0008 A82-15749
The potential for use of Landsat data in water resources planning for the Missouri River Basin p0037 A82-18000

RELIEF MAPS
Development of a coastal relief of the Gulf of Riga, based on results of an analysis of space images p0024 A82-15982

RESOURCES MANAGEMENT
Remote sensing for vineyard management p0001 A82-10047
Remote sensing contributions to the management of renewable resources p0055 A82-12530
Study of the anthropogenic influence on the environment, based on multispectral scanning images p0008 A82-15965
The potential for use of Landsat data in water resources planning for the Missouri River Basin p0037 A82-18000
Application of remote sensing data on the continental shelf: Proceedings of an EARseL-ESA Symposium
[ESA-SP-167] p0029 N82-14553
Fisheries investigations and management benefits from remote sensing --- fish tracking p0030 N82-14559
Application of remote sensing to selected problems within the state of California
[E82-10004] p0004 N82-15482

RIVER BASINS
Airborne laser acquisition of cross-section data p0049 A82-12600
Cost effective computer processing of airborne scanner data for regional level mapping p0043 A82-15970

RIVERS
Satellite rainfall estimation for hydrologic forecasting p0035 A82-10032
Study of the dynamics of the Danube delta using space images p0036 A82-15961
Visual observations of floating ice from Skylab p0037 N82-12504
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10006] p0039 N82-15486

ROADS
Cultural features imaged and observed from Skylab 4 p0010 N82-12499

ROCKET SOUNDING
Repeatability and measurement uncertainty of the United States meteorological rocketsonde p0049 A82-12127

ROCKY MOUNTAINS (NORTH AMERICA)
An application of Landsat derived data to a regional hydrologic model p0037 A82-17999

ROUTES
An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry p0030 N82-14564

RURAL AREAS
Cultural features imaged and observed from Skylab 4 p0010 N82-12499

RURAL LAND USE
Rural development in the humid tropics p0003 A82-16162

S

S MATRIX THEORY
A theory of wave scattering from an inhomogeneous layer with an irregular interface p0041 A82-12757

SALINITY
Remote sensing of the Chesapeake Bay plume salinity via microwave radiometry p0027 N82-10670
Operational use of remote sensing for coastal zone management and possible contribution of specialized satellites --- aerial photography p0031 N82-14574
The feasibility of using remotely sensed color as an index of Irish coastal water properties --- statistical correlation of sea truth data p0032 N82-14581
Measurements of radar backscatter from Arctic Sea ice in the summer, Appendices A and B
[AD-A105736] p0032 N82-14593

SAN ANDREAS FAULT
Geological features of southwestern North America p0020 N82-12495

SANDS
Desert sand seas p0020 N82-12493

SATELLITE OBSERVATION
Magnetic field-aligned electron distributions in the dayside cusp p0015 A82-12186
The potential and requirements for space oceanography --- National Oceanic Satellite system and U.S. Navy requirements p0029 N82-14556
Analysis of satellite observations: Theoretical studies on the sampling problem
[MITT-31] p0056 N82-15499

SATELLITE ORBITS
Distant magnetic field effects associated with Birkeland currents /made possible by the evaluation of TRIAD's attitude oscillations/ p0015 A82-12215
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10005] p0053 N82-15483
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] p0054 N82-15495

SATELLITE SURFACES
Coordinates of features on the Galilean satellites p0019 A82-12366

SATELLITE TELEVISION
The 1981 RCA space constellation p0055 A82-12541
Satellites of the Meteor series, intended for earth studies from space p0050 A82-15951
Technical equipment of an experiment for remote sensing of the earth from space p0050 A82-15952

SATELLITE-BORNE INSTRUMENTS
Metrological support of measurements of earth-surface brightness by the Fragment multispectral scanning system p0050 A82-15958
Magnetic field observations on DE-A and -B --- Dynamics Explorer A and B satellites p0051 A82-16447

SATELLITE-BORNE PHOTOGRAPHY
Coordinates of features on the Galilean satellites p0019 A82-12366
Satellites of the Meteor series, intended for earth studies from space p0050 A82-15951
Technical equipment of an experiment for remote sensing of the earth from space p0050 A82-15952
Study of the anthropogenic influence on the environment, based on multispectral scanning images p0008 A82-15965
Processing of multispectral image data on special-purpose computer systems p0044 A82-16627
Computational aspects of geometric correction data generation in the LANDSAT-D imagery processing p0045 N82-10072
Scanner --- photography from a spin stabilized synchronous satellite
[NASA-CASE-GSC-12032-2] p0052 N82-13465

SATELLITE-BORNE RADAR
Study on satellite radar altimetry in climatological and oceanographic research, volume 2
[SP/153/06/01FR(80)-VOL-2] p0026 N82-10487

SAUDI ARABIA
A history of flying and photography: In the Photogrammetry Division of the National Ocean Survey 1919 - 1979
[PB81-246738] p0017 N82-15520

SCANNERS
Scanner --- photography from a spin stabilized synchronous satellite
[NASA-CASE-GSC-12032-2] p0052 N82-13465

SCANNING
Airborne and spaceborne multispectral photography of the earth --- Russian book p0043 A82-16601

SCATTERING CROSS SECTIONS
Airborne laser acquisition of cross-section data p0049 A82-12600

SCATTEROMETERS
Evaluation of the Seasat wind scatterometer p0025 A82-18716

SCENE ANALYSIS
Data compression and reconstruction for mixed resolution multispectral sensors p0049 A82-10045
MATE VAN: Mobile analysis and training extension --- analyzing LANDSAT digital data
[NASA-TM-84056] p0045 N82-10466
Application of remote sensing to selected problems within the state of California
[E82-10004] p0004 N82-15482

SEA ICE
The development of the Tiros Global Environmental Satellite System
[AIAA PAPER 82-0383] p0025 A82-17915
Measurement of sea and ice backscatter reflectivity using an OTH radar system p0025 A82-18074
The ice-conditions in the Greenland waters, 1965. Coastal maps
[ISBN-87-7478-183-9] p0026 N82-10467
Study on satellite radar altimetry in climatological and oceanographic research, volume 1
[SP/153/06/01/FR(80)-VOL-1] p0026 N82-10486
Ice conditions in the eastern Bering Sea from NOAA and LANDSAT imagery: Winter conditions 1974, 1976, 1977, 1979
[PB81-220188] p0028 N82-11537
Visual observations of floating ice from Skylab p0037 N82-12504
The ice conditions in the Greenland waters
[ISBN-87-7478-183-9] p0028 N82-12533
Boundary detection criteria for satellite altimeters
[NASA-CR-156880] p0028 N82-12734
ERS-1: Mission objectives and system concept p0029 N82-14554
The Norwegian remote sensing experiment (Norsex) in a marginal ice zone p0031 N82-14566
Marine activities in Sweden for which remote sensing data may be of interest --- oceanography, weather forecasting, and analysis p0031 N82-14576
Measurements of radar backscatter from Arctic Sea ice in the summer
[AD-A105586] p0032 N82-14592
Measurements of radar backscatter from Arctic Sea ice in the summer, Appendices A and B
[AD-A105736] p0032 N82-14593

SEA ROUGHNESS
SAR imaging of ocean waves - Theory p0023 A82-11202
A mathematical model of an over-sea airborne UHF radio link p0049 A82-11406
Ocean surface height-slope probability density function from SEASAT altimeter echo p0024 A82-15076
Images of sea waves obtained in polarimetric surveys p0024 A82-16620
Evaluation of the Seasat wind scatterometer p0025 A82-18716
Anomalous wind estimates from the Seasat scatterometer p0026 A82-18724
Visual observations of the ocean p0028 N82-12502
Determination of surface wind speed from remotely measured whitecap coverage, a feasibility assessment p0030 N82-14565
A preliminary evaluation of Seasat performance over the area of JASIN and its relevance to ERS-1 p0031 N82-14567
Oil spills: Large scale monitoring by LANDSAT p0012 N82-14572
Project Noordwijk. Part 1: Measurements of the radar backscatter coefficient gamma (sigma deg) in 1977 and 1978 --- on a sea platform
[PHL-1979-49-PT-1] p0032 N82-14617

Project Noordwijk. Part 2: Results of North Sea clutter measurements in the I-band performed from the platform Noordwijk in September/October 1977
[PHL-1980-28-PT-2] p0033 N82-14818
SEA STATES
Analysis of SEASAT wind observations over the Indian Ocean p0023 A82-10671
Radar backscattering from ocean waves at low grazing angles p0023 A82-14730
Investigation of survey conditions for the ocean surface in the 0.4-1.1 micron spectral range p0024 A82-15960
Global satellite measurements of water vapour, wind speed and wave height p0051 A82-17165
A global atlas of GEOS-3 significant waveheight and comparison of the data with national buoy data p0026 N82-10860
State-of-the-art in using a spaceborne altimeter and scatterometer for the determination of wind, sea state, and marine and ice dynamics --- Seasat instruments p0052 N82-14560
An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry p0030 N82-14564
Scientific studies using Bhaskara satellite microwave radiometer (SAMIR) data: A short overview --- calibration of the instrument and its use in the study of oceanographic parameters p0032 N82-14587
Remote sensing of sea state by laser altimeters
[NASA-CR-165049] p0033 N82-14789
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156882] p0033 N82-15498
SEA TRUTH
The Norwegian remote sensing experiment (Norsex) in a marginal ice zone p0031 N82-14566
Coastal zone research using remote sensing techniques --- calibration of coastal zone color scanner p0031 N82-14571
The feasibility of using remotely sensed color as an index of Irish coastal water properties --- statistical correlation of sea truth data p0032 N82-14581
Necessity of remote sensing for ocean studies. Part 1: Northwest African missions, Sahara-1 and Atlor-1 --- sea truth/remote sensing correlation of offshore upwelling p0032 N82-14582
A look at nonsatellite remote sensing systems for marine use --- together with satellite systems, overall view of the technology p0032 N82-14586
GEM: A simple meteorological buoy with satellite telemetry p0053 N82-14779
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156882] p0033 N82-15498
SEA WATER
Variations in upper ocean heat storage determined from satellite data p0025 A82-17567
CTD/02 measurements during the Equatorial Pacific Ocean Climate Study (EPOCS) in 1979
[PB81-211203] p0026 N82-10461
Preliminary analysis of ocean color scanner data from Superflux III p0027 N82-10672
Development of the coastal zone color scanner for NIMBUS 7. Volume 1: Mission objectives and instrument description
[NASA-CR-166720-VOL-1] p0028 N82-11511
The color of the sea and its relation to surface chlorophyll and depth of the euphotic zone p0030 N82-14562
SEAMOUNTS
Visual observations of the ocean p0028 N82-12502
SEARCH RADAR
Three bearing method for passive triangulation in systems with unknown deterministic biases p0050 A82-15920
SEAS
Availability of Seasat synthetic aperture radar imagery p0050 A82-15039
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab p0020 N82-12494
SEASAT SATELLITES
State-of-the-art in using a spaceborne altimeter and scatterometer for the determination of wind, sea state, and marine and ice dynamics --- Seasat instruments p0052 N82-14560
The Seasat commercial demonstration program p0030 N82-14561
SEDIMENT TRANSPORT
Mapping of surface currents in Greenland fiords by means of LANDSAT images --- multispectral photography p0038 N82-14579
The use of LANDSAT MSS to observe sediment distribution and movement in the Solent coastal area --- multispectral scannel (MSS) p0038 N82-14580
Maritime applications of image processing at DFVLR, Oberpfaffenhofen, West Germany --- LANDSAT multispectral scanner images, digital interactive image analysis p0032 N82-14585
SEDIMENTARY ROCKS
Remote sensing studies of some ironstone gravels and plinthite in Thailand p0019 N82-12491
SEDIMENTS
Recent work in passive optical imaging of water --- space and aircraft derived data p0038 N82-14575
The use of LANDSAT MSS to observe sediment distribution and movement in the Solent coastal area --- multispectral scannel (MSS) p0038 N82-14580
SENSITIVITY
Evaluation of the Seasat wind scatterometer p0025 A82-18716
Assessment of Superflux relative to remote sensing --- airborne remote sensing of the Chesapeake Bay plume and shelf regions p0028 N82-10694
SEWAGE
A marine environmental monitoring and assessment program p0027 N82-10663
Operational use of remote sensing for coastal zone management and possible contribution of specialized satellites --- aerial photography p0031 N82-14574
SHALLOW WATER
An inertially-aided aircraft track recovery system for coastal mapping p0037 A82-18166
Photo inertial positioning system development at the Canada Centre for Remote Sensing p0045 A82-18167
SHIP TERMINALS
A mathematical model of an over-sea airborne UHF radio link p0049 A82-11406
SHORELINES
Satellite imagery and shoreline erosion prediction p0036 A82-12595
SPOT data simulations: Littoral applications p0046 N82-14568
SIBERIA
Investigation of the spatial structure of space images of the earth's surface p0044 A82-16626
SIDE-LOOKING RADAR
The observation of tidal patterns, currents, and bathymetry with SLAR imagery of the sea p0023 A82-11201
Use of radar and microwave radiometry for reconnaissance satellites
[FOA-C-30204-E1] p0052 N82-10481
Use of Side Looking Airborne Radar (SLAR) for oil pollution monitoring in Norway p0012 N82-14588
SIGNAL PROCESSING
A digital fast correlation approach to produce SEASAT SAR imagery p0042 A82-14870
SINKHOLES
Remote sensing study of sinkhole occurrence p0019 A82-12590
SKY RADIATION
Spectral atmospheric observations at Nantucket Island, May 7-14, 1981
[NASA-TM-83196] p0029 N82-14550
SKYLAB 4
Skylab explores the Earth
[NASA-SP-380] p0019 N82-12492
SMOKE
Quantitative analysis of atmospheric pollution phenomena p0010 N82-12505
SNOW
Analysis of bright bands from 3-D radar data --- for snow/rain delineation p0035 A82-10208
SNOW COVER
Effect of grain size and snowpack water equivalence on visible and near-infrared satellite observations of snow p0035 A82-12553
Reflectivity and emissivity of snow and ground at mm waves p0042 A82-14860
Snow-mapping experiment p0037 N82-12498
Progress in radar snow research --- Brookings, South Dakota
[NASA-CR-166709] p0038 N82-12510
Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227795] p0039 N82-15673
SOIL EROSION
Areawide soil loss predictions using CIR airphotos p0007 A82-12591
Investigation and mapping of the erosion relief of the Kalachskaia upland on the basis of multispectral scanner images p0008 A82-15966
Report on Skylab 4 African drought and arid land experiment p0037 N82-12501
SOIL MAPPING
Remote sensing techniques in the study of the agricultural potential of soils under the Cerrado vegetation /Brazil/ p0001 A82-10040
Limitations in the spectral discrimination of the Landsat MSS p0001 A82-10046
A comparison of radiative transfer models for predicting the microwave emission from soils p0035 A82-10694
Space photographs obtained with the Fragment system as a base for landscape mapping and physical-geographical classification of arid territories p0009 A82-15967
Aircraft radar response to soil moisture p0003 A82-17564
SOIL MOISTURE
Aircraft radar response to soil moisture p0003 A82-17564
Remote sensing of crop moisture status p0003 A82-17997
An evaluation of the spatial resolution of soil moisture information
[NASA-CR-166724] p0009 N82-11513
Analysis of soil moisture extraction algorithm using data from aircraft experiments
[NASA-CR-166719] p0046 N82-13470
A simulation study of the recession coefficient for antecedent precipitation index --- soil moisture and water runoff estimation
[NASA-TM-83860] p0038 N82-14549
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10008] p0039 N82-15486
SOILS
The choice of the orientation of the analyzer in polarimetric surveys p0044 A82-16621
Analysis of the information content of the polarimetric method of remote sensing p0003 A82-16622
Remote sensing studies of some ironstone gravels and plinthite in Thailand p0019 N82-12491
SOLAR FLUX DENSITY
Ionospheric propagation correction modeling for satellite altimeters
[NASA-CR-156881] p0052 N82-12447
SOLAR RADIATION
The surface albedo of the earth in the near ultraviolet /330-340 nm/ p0016 A82-15032
Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227795] p0039 N82-15673
SORGHUM
Remote sensing of crop moisture status p0003 A82-17997
SOUNDING ROCKETS
Repeatability and measurement uncertainty of the United States meteorological rocketsonde p0049 A82-12127
SOUTH AMERICA
Upper tropospheric cyclonic vortices in the tropical South Atlantic p0009 A82-16325
Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador p0020 N82-12496
Mesoscale cloud features observed from Skylab p0011 N82-12509
SOUTH CAROLINA
Remote sensing of benthic microalgal biomass with a tower-mounted multispectral scanner p0024 A82-15031
SOUTH DAKOTA
Progress in radar snow research --- Brookings, South Dakota
[NASA-CR-166709] p0038 N82-12510
Remote sensing applications to resource problems in South Dakota
[E82-10002] p0004 N82-15481
SOUTHEAST ASIA
Rural development in the humid tropics p0003 A82-16162
SOUTHERN CALIFORNIA
Trace pollutant concentrations in a multiday smog episode in the California South Coast Air Basin by long path length Fourier transform infrared spectroscopy p0007 A82-10700
SOVIET SPACECRAFT
Satellites of the Meteor series, intended for earth studies from space p0050 A82-15951
Technical equipment of an experiment for remote sensing of the earth from space p0050 A82-15952
Meteorological satellites
[AD-A107427] p0053 N82-15110
SOYBEANS
Limitations in the spectral discrimination of the Landsat MSS p0001 A82-10046
SPACE MISSIONS
Report on Active and Planned Spacecraft and experiments
[NASA-TM-84025] p0055 N82-10087
SPACE SHUTTLE ORBITERS
Mission operation report: OSTA-1
[NASA-TM-84053] p0055 N82-10102
Shuttle applications in tropospheric air quality observations
[NASA-CR-145374] p0010 N82-11635
SPACE SHUTTLES
The 1981 RCA space constellation p0055 A82-12541
SPACEBORNE EXPERIMENTS
Report on Active and Planned Spacecraft and experiments
[NASA-TM-84025] p0055 N82-10087
Mission operation report: OSTA-1
[NASA-TM-84053] p0055 N82-10102
SPACECRAFT LAUNCHING
The 1981 RCA space constellation p0055 A82-12541
SPACECRAFT PERFORMANCE
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10006] p0053 N82-15483
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] p0054 N82-15495
SPACELAB
Spacelab-research of European regions with strong negative environmental influences, based on AVHRR-data of the satellites Tiros-N and NOAA p0007 A82-12517
SPATIAL DISTRIBUTION
The effect of spatial variability in precipitation on streamflow
[AD-A105955] p0038 N82-14589
SPATIAL RESOLUTION
Data compression and reconstruction for mixed resolution multispectral sensors p0049 A82-10045
Structural analysis of aerial and space images p0044 A82-16625
Investigation of the spatial structure of space images of the earth's surface p0044 A82-16626

An evaluation of the spatial resolution of soil moisture information
[NASA-CR-166724] p0009 N82-11513

SPECTRAL CORRELATION
In situ spectral reflectance studies of tidal wetland grasses p0036 A82-15969
Spectral correlation filters and natural colour coding p0043 A82-16160

SPECTRAL EMISSION
Nitric oxide delta band emission in the earth's atmosphere Comparison of a measurement and a theory p0008 A82-13268

SPECTRAL RECONNAISSANCE
Spectrometric studies of the earth's surface p0043 A82-16612
Methodology and practice of spectroscopic measurements of landscape elements in the preparation and carrying out of down-looking experiments p0051 A82-16613
The application of holographic gratings in spectrometers for the spatial-spectral analysis of the earth's surface from aerial and space platforms in the visible and near-infrared spectral regions p0044 A82-16614
Use of radar and microwave radiometry for reconnaissance satellites
[FOA-C-30204-E1] p0052 N82-10481
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York. Volume 1: Data acquisition, reduction and interpretation
[DE82-000650] p0053 N82-14599
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000781] p0020 N82-14600
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000401] p0020 N82-14601
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000780] p0021 N82-14602
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000872] p0021 N82-14603
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000772] p0021 N82-14604
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000785] p0021 N82-14605
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000869] p0021 N82-14606
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000794] p0021 N82-14607
NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2
[DE82-000784] p0021 N82-14608

SPECTRAL REFLECTANCE
The effect of angular factors on popularly used indicators of vegatative vigor p0001 A82-10039
Limitations in the spectral discrimination of the Landsat MSS p0001 A82-10046
Spectral behavior of wheat yield variety trials p0002 A82-10863
Intercalibration of Landsat 1-3 and NOAA 6 and 7 scanner data p0049 A82-13293
Reflectivity and emissivity of snow and ground at mm waves p0042 A82-14860
Temporal relationships between spectral response and agronomic variables of a corn canopy p0002 A82-15038
Metrological support of measurements of earth-surface brightness by the Fragment multispectral scanning system p0050 A82-15958
Investigation of survey conditions for the ocean surface in the 0.4-1.1 micron spectral range p0024 A82-15960
In situ spectral reflectance studies of tidal wetland grasses p0036 A82-15969
Measurement of sea and ice backscatter reflectivity using an OTH radar system p0025 A82-18074
Identification of lithologic units using multichannel imaging systems p0046 N82-11509

SPECTRAL RESOLUTION
Estimation of the brightness field from results of multispectral photography of the earth from space p0044 A82-16617

SPECTRAL SENSITIVITY
An improvement in land cover classification achieved by merging microwave data with Landsat multispectral scanner data p0007 A82-10043
Evaluation of the information content of the channels of spaceborne multispectral photography of the Fergana region by the MKF-6 camera from Soyuz-22 p0043 A82-16605
SPOT data simulations: Littoral applications p0046 N82-14568

SPECTRAL SIGNATURES
The discrimination of winter wheat using a growth-state signature p0002 A82-15026
Inclusion of a simple vegetation layer in terrain temperature models for thermal infrared (IR) signature prediction
[AD-A104469] p0003 N82-11910
A recommended sensor package for the detection and tracking of oil spills p0053 N82-14563

SPECTROMETERS
The application of holographic gratings in spectrometers for the spatial-spectral analysis of the earth's surface from aerial and space platforms in the visible and near-infrared spectral regions p0044 A82-16614

SPECTROPHOTOMETRY
Spectral atmospheric observations at Nantucket Island, May 7-14, 1981
[NASA-TM-83196] p0029 N82-14550

SPECTROSCOPY
Spectrometric studies of the earth's surface p0043 A82-16612
Methodology and practice of spectroscopic measurements of landscape elements in the preparation and carrying out of down-looking experiments p0051 A82-16613

SPOT (FRENCH SATELLITE)
SPOT data simulations: Littoral applications p0046 N82-14568

SPRINGS (WATER)
Remote sensing that motivated community action p0008 A82-12594

STACKS
Study of stack emissions by combination of lidar and correlation spectrometer p0008 A82-12816

STATISTICAL ANALYSIS
Factorial analysis of terrain feature positioning parameters used in combining radar and digital terrain model data p0015 A82-10029
Analysis of variance of thematic mapping experiment data p0009 A82-15968
Estimation of the brightness field from results of multispectral photography of the earth from space p0044 A82-16617
Programs for the statistical analysis of multispectral photographs p0044 A82-16628

STEREOPHOTOGRAPHY
Orientation and construction of models. I - The orientation problem in close-range photogrammetry p0049 A82-10858
Aerial-photography flights over Upper Franconia in 1980 Operation and first application-related experience p0008 A82-15749
Orientation and construction of models. III - Mathematical basis of the orientation problem of one-dimensional central perspective photographs p0043 A82-15973
An inertially-aided aircraft track recovery system for coastal mapping p0037 A82-18166

STORMS
An evaluation of the spatial resolution of soil moisture information
[NASA-CR-166724] p0009 N82-11513

STREAMS
An application of Landsat derived data to a regional hydrologic model p0037 A82-17999

STRIP MINING
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] p0013 N82-15488

STRUCTURAL BASINS
An application of Landsat derived data to a regional hydrologic model p0037 A82-17999

STRUCTURAL PROPERTIES (GEOLOGY)
Morphostructural analyses of space imagery in the central Colorado Plateau p0019 N82-10465
Geology and linears of Libya p0019 N82-10618
The Manicouagan impact structure observed from Skylab
[CONTRIB-544] p0020 N82-12497
Reports of Planetary Geology Program, 1981
[NASA-TM-84211] p0016 N82-14041

SULFUR DIOXIDES
Study of stack emissions by combination of lidar and correlation spectrometer p0008 A82-12816
Aircraft data summaries of the SURE intensives, volume 4
[DE82-900311] p0012 N82-13569

SUPPORT SYSTEMS
ISRO satellite mission support facilities - Scope and future plans p0055 A82-17307

SURFACE LAYERS
Thermal inertia, thermal admittance, and the effect of layers p0008 A82-15027

SURFACE PROPERTIES
Metrological support of measurements of earth-surface brightness by the Fragment multispectral scanning system p0050 A82-15958
Investigation of survey conditions for the ocean surface in the 0.4-1.1 micron spectral range p0024 A82-15960

SURFACE ROUGHNESS
Airborne laser acquisition of cross-section data p0049 A82-12600
A theory of wave scattering from an inhomogeneous layer with an irregular interface p0041 A82-12757
A global atlas of GEOS-3 significant waveheight and comparison of the data with national buoy data p0026 N82-10660
Progress in radar snow research --- Brookings, South Dakota
[NASA-CR-166709] p0038 N82-12510

SURFACE TEMPERATURE
Two-dimensional model variability in thermal inertia surveys p0042 A82-15029
Comparison of polar and geostationary satellite infrared observations of sea surface temperatures in the Gulf of Maine p0024 A82-15030
Inclusion of a simple vegetation layer in terrain temperature models for thermal infrared (IR) signature prediction
[AD-A104469] p0003 N82-11910
Analysis of soil moisture extraction algorithm using data from aircraft experiments
[NASA-CR-166719] p0046 N82-13470
Necessity of remote sensing for ocean studies. Part 1: Northwest African missions, Sahara-1 and Atlor-1 --- sea truth/remote sensing correlation of offshore upwelling p0032 N82-14582
An investigation into the applicability of thermal infrared scanning for exploration
[BMFT-FB-T-81-087] p0022 N82-15925

SURFACE WATER
Application of Landsat to the inventory of DAMS p0036 A82-12593

SURGES
Characteristics of westward travelling surges during magnetospheric substorms p0050 A82-14299

SUSQUEHANNA RIVER BASIN (MD-NY-PA)
Texture transforms of remote sensing data p0042 A82-15034

SWEDEN
Marine activities in Sweden for which remote sensing data may be of interest --- oceanography, weather forecasting, and analysis p0031 N82-14576

SYNOPTIC METEOROLOGY
An investigation of a polar low with a spiral cloud structure p0007 A82-10816
Analysis of SEASAT wind observations over the Indian Ocean p0023 A82-10671

SYNTHETIC APERTURE RADAR
Preliminary results of mapping urban land cover with Seasat SAR imagery p0007 A82-10044
SAR imaging of ocean waves - Theory p0023 A82-11202
Wave orbital velocity, fade, and SAR response to azimuth waves p0023 A82-11203
A digital fast correlation approach to produce SEASAT SAR imagery p0042 A82-14870
Availability of Seasat synthetic aperture radar imagery p0050 A82-15039
Optically processed Seasat radar mosaic of Florida p0042 A82-15125
Seasat SAR processing at the Norwegian Defence Research Establishment --- design and operation of a digital process p0046 N82-14584
Remote Sensing Information Bulletin; Issue number 6 p0053 N82-14616
Additional studies of Earth resources synthetic aperture radar payloads
[MTR-80/90] p0054 N82-15500
New baseline system p0054 N82-15501
Squinted SAR system p0047 N82-15502

SYSTEMS SIMULATION
Onboard utilization of ground control points for image correction. Volume 1: Executive summary
[NASA-CR-166731] p0045 N82-10469

T

TECHNOLOGY TRANSFER
Introducing remote sensing to county-level agencies in Michigan through the Cooperative Extension Service p0007 A82-10034
MATE VAN: Mobile analysis and training extension --- analyzing LANDSAT digital data
[NASA-TM-84056] p0045 N82-10466
Technology transfer of NASA microwave remote sensing system
[NASA-CR-165791] p0028 N82-11515

TECTONIC PLATES
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab p0020 N82-12494

TECTONICS
Space techniques to monitor movements in the earth's crust p0016 A82-18797

TELEMETRY
Technical equipment of an experiment for remote sensing of the earth from space p0050 A82-15952
Experimental telemetry system based on the Fragment multispectral scanning system p0050 A82-15955

TEMPERATURE INVERSIONS
Detection of monsoon inversion by TIROS-N satellite p0024 A82-17168

TENNESSEE
Airborne laser acquisition of cross-section data p0049 A82-12600

TERRAIN ANALYSIS
Factorial analysis of terrain feature positioning parameters used in combining radar and digital terrain model data p0015 A82-10029
Airborne laser acquisition of cross-section data p0049 A82-12600
Investigation and mapping of the erosion relief of the Kalachskaia upland on the basis of multispectral scanner images p0008 A82-15866

Space photographs obtained with the Fragment system as a base for landscape mapping and physical-geographical classification of arid territories p0009 A82-15967

Description and comparison of algorithms for solving large sets of sparse matrix normal equations in geodesy and photogrammetry
[SER-C-261] p0017 N82-15812

TERRESTRIAL RADIATION

Metrological support of measurements of earth-surface brightness by the Fragment multispectral scanning system p0050 A82-15958

Infrared radiance model variation by sensor flight measurements p0052 N82-14171

Analysis of satellite observations: Theoretical studies on the sampling problem
[MITT-31] p0056 N82-15499

TEXAS

Areawide soil loss predictions using CIR airphotos p0007 A82-12591

Statistical Techniques Applied to Aerial Radiometric Surveys (STAARS): Series introduction and the principal-components-analysis method --- National Uranium Resource Evaluation Program
[DE81-029177] p0019 N82-10476

Report of survey for McDonald Observatory, Harvard Radio Astronomy Station, and vicinity
[PB81-234338] p0016 N82-13606

TEXTURES

Texture transforms of remote sensing data p0042 A82-15034

Investigation of the spatial structure of space images of the earth's surface p0044 A82-16626

THAILAND

Rural development in the humid tropics p0003 A82-16162

Remote sensing studies of some ironstone gravels and plinthite in Thailand p0019 N82-12491

THEMATIC MAPPING

Mapping vegetation association boundaries with Landsat MSS data - An Oklahoma example p0001 A82-10041

An improvement in land cover classification achieved by merging microwave data with Landsat multispectral scanner data p0007 A82-10043

Preliminary results of mapping urban land cover with Seasat SAR imagery p0007 A82-10044

Repetitive aerial photography for assessing marsh vegetation changes p0001 A82-10048

Satellite sensing of irrigation patterns in semiarid areas An Indian study p0002 A82-10864

Temporal spectral response of a corn canopy p0002 A82-12886

Aerial and space methods in cartography p0016 A82-12915

Investigations concerning the image-controlled segmentation of objects in multispectral imagery data --- German thesis p0042 A82-15003

Analysis of variance of thematic mapping experiment data p0009 A82-15968

Processing of multispectral image data on special-purpose computer systems p0044 A82-16627

Linear combinations of multispectral images p0044 A82-16629

Application of the NASA airborne oceanographic lidar to the mapping of chlorophyll and other organic pigments p0027 N82-10684

The operational oil pollution surveillance system being used in France: Forecasted future developments in consideration of the NATO/CCMS remote sensing pilot study conclusions p0012 N82-14573

Remote sensing in forestry: Application to the Amazon region
[E82-10012] p0005 N82-15490

A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156882] p0033 N82-15498

THERMAL CONDUCTIVITY

Thermal inertia, thermal admittance, and the effect of layers p0008 A82-15027

THERMAL MAPPING

Mapping of the 1978 Kentucky River Flood from NOAA-5 satellite thermal infrared data p0035 A82-10033

Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, University of Wisconsin, Madison, WI, August 13, 14, 1980 p0035 A82-12589

Water temperature mapping by infrared scanner p0036 A82-12598

Synoptic thermal and oceanographic parameter distributions in the New York Bight Apex p0023 A82-12885

Two-dimensional model variability in thermal inertia surveys p0042 A82-15029

Use of visible and thermal satellite data to monitor an intermittently flooding marshland p0036 A82-15037

The use of satellite infrared imagery for describing ocean processes in relation to spawning of the northern anchovy /Engraulis mordax/ p0025 A82-17565

Remote sensing of crop moisture status p0003 A82-17997

Inclusion of a simple vegetation layer in terrain temperature models for thermal infrared (IR) signature prediction
[AD-A104469] p0003 N82-11910

A recommended sensor package for the detection and tracking of oil spills p0053 N82-14563

A short review of an oceanographic use of Meteosat data by the ORSTOM remote sensing service p0031 N82-14570

Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0021 N82-15489

Biological patchiness in relation to satellite thermal imagery and associated chemical mesoscale features
[AD-A105757] p0047 N82-15504

An investigation into the applicability of thermal infrared scanning for exploration
[BMFT-FB-T-81-067] p0022 N82-15925

THERMAL POLLUTION

Airborne remote sensing of the coastal zone p0053 N82-14577

THERMAL RESISTANCE

Two-dimensional model variability in thermal inertia surveys p0042 A82-15029

THUNDERSTORMS

Analysis of rainfall from flash flood producing thunderstorms, using GOES data p0038 N82-14724

TIDAL FLATS

Remote sensing of benthic microalgal biomass with a tower-mounted multispectral scanner p0024 A82-15031

In situ spectral reflectance studies of tidal wetland grasses p0036 A82-15969

TIDAL WAVES

The observation of tidal patterns, currents, and bathymetry with SLAR imagery of the sea p0023 A82-11201

TIDES

Seasat altimetry adjustment model including tidal and other sea surface effects
[AD-A104188] p0026 N82-10473

TIMBER IDENTIFICATION

An improvement in land cover classification achieved by merging microwave data with Landsat multispectral scanner data p0007 A82-10043

Identification of conifer species groupings from Landsat digital classifications p0002 A82-12887

Remote sensing in forestry: Application to the Amazon region
[E82-10012] p0005 N82-15490

TIMBER INVENTORY

A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras p0003 A82-15748

Mapping of forest vegetation on the basis of space images p0003 A82-15964

TIMBER VIGOR

Evaluation of digital photographic enhancement for Dutch elm disease detection p0002 A82-12884

Large-scale color aerial photography as a tool in sampling for mortality rates
[PB81-214777] p0003 N82-10489

Remote sensing applications to resource problems in South Dakota
[E82-10002] p0004 N82-15481

TIROS N SERIES SATELLITES

User needs and the future of operational meteorological satellites
[AIAA PAPER 82-0388] p0051 A82-17918

TIROS SATELLITES

The development of the Tiros Global Environmental Satellite System
[AIAA PAPER 82-0383] p0025 A82-17915

TOPOGRAPHY

A new method for computing distortion p0016 A82-12914

Geometric quality of MKF-6 photographs p0043 A82-16606

Small-scale terrain mapping based on numerical interpretation of LANDSAT imagery
[VTT-40] p0045 N82-10485

TRACE CONTAMINANTS

Trace pollutant concentrations in a multiday smog episode in the California South Coast Air Basin by long path length Fourier transform infrared spectroscopy p0007 A82-10700

TRACE ELEMENTS

Proof of concept study
[AD-A104338] p0010 N82-11639

Limit on remote FTIR detection of trace gases
[AD-A104842] p0011 N82-12511

TRACKING NETWORKS

ISRO satellite mission support facilities - Scope and future plans p0055 A82-17307

TRAINING DEVICES

MATE VAN: Mobile analysis and training extension --- analyzing LANDSAT digital data
[NASA-TM-84056] p0045 N82-10466

TRANSFORMATIONS (MATHEMATICS)

Texture transforms of remote sensing data p0042 A82-15034

TRANSIT TIME DATA PROCESSING

Boundary detection criteria for satellite altimeters
[NASA-CR-156880] p0028 N82-12734

TREES (PLANTS)

Large-scale color aerial photography as a tool in sampling for mortality rates
[PB81-214777] p0003 N82-10489

TRIANGULATION

Phototriangulation with map referencing of photographs in linear surveys p0016 A82-12912

Block adjustment with additional parameters p0049 A82-13738

Compensation of systematic errors of image and model coordinates p0043 A82-15765

Three bearing method for passive triangulation in systems with unknown deterministic biases p0050 A82-15920

Some problem areas in the field of quality control for aerotriangulation p0016 A82-16161

TROPICAL METEOROLOGY

Upper tropospheric cyclonic vortices in the tropical South Atlantic p0009 A82-16325

Detection of monsoon inversion by TIROS-N satellite p0024 A82-17168

Annual and nonseasonal variability of monthly low-level wind fields over the Southeastern Tropical Pacific p0025 A82-17494

National Hurricane operations plan
[PB81-247231] p0013 N82-15697

TROPICAL REGIONS

Rural development in the humid tropics p0003 A82-16162

The use of digitally processed Landsat imagery for vegetation mapping in Sulawesi, Indonesia p0003 A82-17998

TROPICAL STORMS

Some aspects of tropical storm structure revealed by handheld-camera photographs from space p0011 N82-12507

TROPOSPHERE

Results from the July 1981 Workshop on Passive Remote Sensing of the Troposphere
[AIAA PAPER 82-0207] p0009 A82-17841

Shuttle applications in tropospheric air quality observations
[NASA-CR-145374] p0010 N82-11635

U

U.S.S.R.

Study of the anthropogenic influence on the environment, based on multispectral scanning images p0008 A82-15965

Space photographs obtained with the Fragment system as a base for landscape mapping and physical-geographical classification of arid territories p0009 A82-15967

Evaluation of the information content of the channels of spaceborne multispectral photography of the Fergana region by the MKF-6 camera from Soyuz-22 p0043 A82-16605

Spectrometric studies of the earth's surface p0043 A82-16612

Estimation of the brightness field from results of multispectral photography of the earth from space p0044 A82-16617

Linear combinations of multispectral images p0044 A82-16629

Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador p0020 N82-12496

U.S.S.R. SPACE PROGRAM

Satellites of the Meteor series, intended for earth studies from space p0050 A82-15951

Technical equipment of an experiment for remote sensing of the earth from space p0050 A82-15952

Experimental telemetry system based on the Fragment multispectral scanning system p0050 A82-15955

Metrological support of measurements of earth-surface brightness by the Fragment multispectral scanning system p0050 A82-15958

Investigation of survey conditions for the ocean surface in the 0.4-1.1 micron spectral range p0024 A82-15960

Study of the dynamics of the Danube delta using space images p0036 A82-15961

Development of a coastal relief of the Gulf of Riga, based on results of an analysis of space images p0024 A82-15962

Study and mapping of agricultural land use, based on space images p0003 A82-15963

Mapping of forest vegetation on the basis of space images p0003 A82-15964

Main results of the Raduga experiment p0051 A82-16602

U.S.S.R. THEMATIC MAPPING

Investigation and mapping of the erosion relief of the Kalachskaia upland on the basis of multispectral scanner images p0008 A82-15966

ULTRAHIGH FREQUENCIES

A mathematical model of an over-sea airborne UHF radio link p0049 A82-11406

UNDERWATER RESOURCES

Deep Ocean Mining Environmental Study. Environmental effects of commercial-scale mining
[PB81-227753] p0029 N82-13484

UNITED STATES OF AMERICA

Snow-mapping experiment p0037 N82-12498

UPPER ATMOSPHERE

Microwave limb sounder --- measuring trace gases in the upper atmosphere
[NASA-CASE-NPO-14544-1] p0011 N82-12685

UPWELLING WATER

The use of satellite infrared imagery for describing ocean processes in relation to spawning of the northern anchovy /Engraulis mordax/ p0025 A82-17565

A short review of an oceanographic use of Meteosat data by the ORSTOM remote sensing service p0031 N82-14570

Necessity of remote sensing for ocean studies. Part 1: Northwest African missions, Sahara-1 and Atlor-1 --- sea truth/remote sensing correlation of offshore upwelling p0032 N82-14582

URANIUM

Statistical Techniques Applied to Aerial Radiometric Surveys (STAARS): Series introduction and the principal-components-analysis method --- National Uranium Resource Evaluation Program [DE81-029177] p0019 N82-10476

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York. Volume 1: Data acquisition, reduction and interpretation [DE82-000650] p0053 N82-14599

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000781] p0020 N82-14600

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000401] p0020 N82-14601

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000780] p0021 N82-14602

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000872] p0021 N82-14603

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000772] p0021 N82-14604

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000785] p0021 N82-14605

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000869] p0021 N82-14606

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000794] p0021 N82-14607

NURE aerial gamma-ray and magnetic reconnaissance survey of Maine and portions of New York, volume 2 [DE82-000784] p0021 N82-14608

URBAN RESEARCH

Preliminary results of mapping urban land cover with Seasat SAR imagery p0007 A82-10044

Radiative heating rates and some optical properties of the St. Louis aerosol, as inferred from aircraft measurements p0008 A82-14320

Adaptation of land use to surficial geology in metropolitan Washington, D.C. p0010 N82-11718

USER MANUALS (COMPUTER PROGRAMS)

Winterkill indicator model. Crop Condition Assessment Division (CCAD) data base interface driver, user's manual [E82-10014] p0005 N82-15492

USER REQUIREMENTS

Technology transfer of NASA microwave remote sensing system [NASA-CR-165791] p0028 N82-11515

UTAH

Phytoecozonation of Sevier Lake region of Utah using digitized Landsat MSS data p0001 A82-10042

V

VEGETATION

The effect of angular factors on popularly used indicators of vegetative vigor p0001 A82-10039

Remote sensing techniques in the study of the agricultural potential of soils under the Cerrado vegetation /Brazil/ p0001 A82-10040

Mapping vegetation association boundaries with Landsat MSS data - An Oklahoma example p0001 A82-10041

Mapping of forest vegetation on the basis of space images p0003 A82-15964

Methodology and practice of spectroscopic measurements of landscape elements in the preparation and carrying out of down-looking experiments p0051 A82-16613

The choice of the orientation of the analyzer in polarimetric surveys p0044 A82-16621

Analysis of the information content of the polarimetric method of remote sensing p0003 A82-16622

The use of digitally processed Landsat imagery for vegetation mapping in Sulawesi, Indonesia p0003 A82-17998

Inclusion of a simple vegetation layer in terrain temperature models for thermal infrared (IR) signature prediction [AD-A104469] p0003 N82-11910

Vegetation patterns p0004 N82-12500

Remote sensing in forestry. Application to the Amazon region [E82-10012] p0005 N82-15490

VEGETATION GROWTH

Repetitive aerial photography for assessing marsh vegetation changes p0001 A82-10048

VERY LONG BASE INTERFEROMETRY

Space techniques to monitor movements in the earth's crust p0016 A82-18797

VIDEO DATA

Investigations concerning the image-controlled segmentation of objects in multispectral imagery data --- German thesis p0042 A82-15003

VINEYARDS

Remote sensing for vineyard management p0001 A82-10047

VIRGINIA

Repetitive aerial photography for assessing marsh vegetation changes p0001 A82-10048

Analysis of testbed airborne multispectral scanner data from Superflux II --- Chesapeake Bay plume and James Shelf data p0027 N82-10682

VISIBLE INFRARED SPIN SCAN RADIOMETER

Distortion-free mapping of VISSR imagery data from geosynchronous satellites p0051 N82-10071

VISIBLE SPECTRUM

Effect of grain size and snowpack water equivalence on visible and near-infrared satellite observations of snow p0035 A82-12553

VISUAL OBSERVATION

Desert sand seas p0020 N82-12493

Global Tectonics: Some Geologic analyses of observations and photographs from Skylab p0020 N82-12494

Geological features of southwestern North America p0020 N82-12495

Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador p0020 N82-12496

Snow-mapping experiment p0037 N82-12498

Visual observations of the ocean p0028 N82-12502

An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs p0028 N82-12503

Visual observations of floating ice from Skylab p0037 N82-12504

VOLCANOES

Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador p0020 N82-12496

Quantitative analysis of atmospheric pollution phenomena p0010 N82-12505

Satellite observations of the Mt. St. Helens' eruption of 18 May 1980 [AD-A105784] p0012 N82-14591

W

WASHINGTON

Satellite observations of the Mt. St. Helens' eruption of 18 May 1980 [AD-A105784] p0012 N82-14591

WATER COLOR

Field study for Landsat water quality verification p0036 A82-12597

Preliminary analysis of ocean color scanner data from Superflux III p0027 N82-10672

Development of the coastal zone color scanner for NIMBUS 7. Volume 1: Mission objectives and instrument description [NASA-CR-166720-VOL-1] p0028 N82-11511

The color of the sea and its relation to surface chlorophyll and depth of the euphotic zone p0030 N82-14562

Coastal zone research using remote sensing techniques --- calibration of coastal zone color scanner pC031 N82-14571

The feasibility of using remotely sensed color as an index of Irish coastal water properties --- statistical correlation of sea truth data p0032 N82-14581

WATER CURRENTS

Maritime applications of image processing at DFVLR, Oberpfaffenhofen, West Germany --- LANDSAT multispectral scanner images, digital interactive image analysis p0032 N82-14585

WATER DEPTH

The observation of tidal patterns, currents, and bathymetry with SLAR imagery of the sea p0023 A82-11201

An inertially-aided aircraft track recovery system for coastal mapping p0037 A82-18166

Recent work in passive optical imaging of water --- space and aircraft derived data p0038 N82-14575

WATER FLOW

The effect of spatial variability in precipitation on streamflow [AD-A105955] p0038 N82-14589

WATER MANAGEMENT

Civil engineering applications of remote sensing; Proceedings of the Specialty Conference, University of Wisconsin, Madison, WI, August 13, 14, 1980 p0035 A82-12589

The potential for use of Landsat data in water resources planning for the Missouri River Basin p0037 A82-18000

Remote sensing applications to resource problems in South Dakota [E82-10002] p0004 N82-15481

WATER POLLUTION

Spacelab-research of European regions with strong negative environmental influences, based on AVHRR-data of the satellites Tiros-N and NOAA p0007 A82-12517

Remote sensing that motivated community action p0008 A82-12584

Polarimetric surveys of oil slicks p0009 A82-16619

Chesapeake Bay Plume Study: Superflux 1980 [NASA-CP-2188] p0026 N82-10661

Multitemporal calibration of LANDSAT images: A method for improving the marine phenomena recognition, with as example the Venice lagoon --- brightness/green/yellow feature space, image enhancement p0046 N82-14578

WATER QUALITY

The operational use of Landsat for lake quality assessment p0036 A82-12596

Field study for Landsat water quality verification p0036 A82-12597

Role of remote sensing in the study of acid rain impact on aquatic systems [AIAA PAPER 82-0336] p0036 A82-17892

Superflux I, II, and III experiment designs: Water sampling and analyses --- Chespeake Bay, environmental monitoring and remote sensing p0027 N82-10665

Application of the NASA airborne oceanographic lidar to the mapping of chlorophyll and other organic pigments p0027 N82-10684

Recent work in passive optical imaging of water --- space and aircraft derived data p0038 N82-14575

WATER RESOURCES

Landsat imagery for hydrologic modeling p0036 A82-12592

The potential for use of Landsat data in water resources planning for the Missouri River Basin p0037 A82-18000

WATER RUNOFF

Comparison of conventional and remotely sensed estimates of runoff curve numbers in southeastern Pennsylvania p0035 A82-10031

A systems approach to the real-time runoff analysis with a deterministic rainfall-runoff model [PB81-224495] p0037 N82-11530

A simulation study of the recession coefficient for antecedent precipitation index --- soil moisture and water runoff estimation [NASA-TM-83860] p0038 N82-14549

WATER TEMPERATURE

Water temperature mapping by infrared scanner p0036 A82-12598

Synoptic thermal and oceanographic parameter distributions in the New York Bight Apex p0023 A82-12885

Variations in upper ocean heat storage determined from satellite data p0025 A82-17567

The development of the Tiros Global Environmental Satellite System [AIAA PAPER 82-0383] p0025 A82-17915

ICAPS oceanographic data for the Indian Ocean [AD-A103173] p0029 N82-13641

Fisheries investigations and management benefits from remote sensing --- fish tracking p0030 N82-14559

A short review of an oceanographic use of Meteosat data by the ORSTOM remote sensing service p0031 N82-14570

Operational use of remote sensing for coastal zone management and possible contribution of specialized satellites --- aerial photography p0031 N82-14574

WATER VAPOR

Water vapour absorption in the 3.5-4.2 micron atmospheric window p0023 A82-14586

WATER WAVES

SAR imaging of ocean waves - Theory p0023 . 82-11202

Wave orbital velocity, fade, and SAR response to azimuth waves p0023 A82-11203

Radar backscattering from ocean waves at low grazing angles p0023 A82-14730

Ocean surface height-slope probability density function from SEASAT altimeter echo p0024 A82-15076

Determination of the length of sea waves by an airborne radar technique p0024 A82-15213

An analysis of short pulse and dual frequency radar techniques for measuring ocean wave spectra from satellites p0024 A82-15318

Images of sea waves obtained in polarimetric surveys p0024 A82-16620

Global satellite measurements of water vapour, wind speed and wave height p0051 A82-17165

A global atlas of GEOS-3 significant waveheight and comparison of the data with national buoy data p0026 N82-10660

Surface signs of internal ocean dynamics [AD-A101380] p0029 N82-13642

Determination of surface wind speed from remotely measured whitecap coverage, a feasibility assessment p0030 N82-14565

Airborne remote sensing of the coastal zone p0053 N82-14577

A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data [NASA-CR-156882] p0033 N82-15498

WATERSHEDS

Comparison of conventional and remotely sensed estimates of runoff curve numbers in southeastern Pennsylvania p0035 A82-10031

Areawide soil loss predictions using CIR airphotos
p0007 A82-12591

Landsat imagery for hydrologic modeling
p0036 A82-12592

An application of Landsat derived data to a regional hydrologic model
p0037 A82-17999

A simulation study of the recession coefficient for antecedent precipitation index --- soil moisture and water runoff estimation
[NASA-TM-83860] p0038 N82-14549

Remote sensing applications to resource problems in South Dakota
[E82-10002] p0004 N82-15481

WAVE REFLECTION
Wave orbital velocity, fade, and SAR response to azimuth waves
p0023 A82-11203

WAVE SCATTERING
A theory of wave scattering from an inhomogeneous layer with an irregular interface
p0041 A82-12757

WEATHER FORECASTING
A systems approach to the real-time runoff analysis with a deterministic rainfall-runoff model
[PB81-224495] p0037 N82-11530

Some aspects of tropical storm structure revealed by handheld-camera photographs from space
p0011 N82-12507

The Seasat commercial demonstration program
p0030 N82-14561

National Hurricane operations plan
[PB81-247231] p0013 N82-15697

WEST GERMANY
Aerial-photography flights over Upper Franconia in 1980 - Operation and first application-related experience
p0006 A82-15749

WETLANDS
An improvement in land cover classification achieved by merging microwave data with Landsat multispectral scanner data
p0007 A82-10043

Data sources for analyses of Great Lakes wetlands
p0035 A82-10054

In situ spectral reflectance studies of tidal wetland grasses
p0036 A82-15969

A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10018] p0056 N82-15496

WHEAT
Spectral behavior of wheat yield variety trials
p0002 A82-10863

The discrimination of winter wheat using a growth-state signature
p0002 A82-15026

Vegetation patterns
p0004 N82-12500

Wheat cultivation: Identification and estimation of areas using LANDSAT data
[E82-10007] p0004 N82-15485

Winterkill indicator model. Crop Condition Assessment Division (CCAD) data base interface driver, user's manual
[E82-10014] p0005 N82-15492

US/Canada wheat and barley crop calender exploratory experiment implementation plan
[E82-10016] p0005 N82-15494

WILDERNESS
Application of remote sensing to selected problems within the state of California
[E82-10004] p0004 N82-15482

WIND DIRECTION
Evaluation of the Seasat wind scatterometer
p0025 A82-18716

Anomalous wind estimates from the Seasat scatterometer
p0026 A82-18724

WIND MEASUREMENT
Analysis of SEASAT wind observations over the Indian Ocean
p0023 A82-10671

WIND PROFILES
Annual and nonseasonal variability of monthly low-level wind fields over the Southeastern Tropical Pacific
p0025 A82-17494

WIND VELOCITY
Annual and nonseasonal variability of monthly low-level wind fields over the Southeastern Tropical Pacific
p0025 A82-17494

State-of-the-art in using a spaceborne altimeter and scatterometer for the determination of wind, sea state, and marine and ice dynamics --- Seasat instruments
p0052 N82-14560

WIND VELOCITY MEASUREMENT
Oceanic wind and balanced pressure-height fields derived from satellite measurements
p0023 A82-13214

Global satellite measurements of water vapour, wind speed and wave height
p0051 A82-17165

Evaluation of the Seasat wind scatterometer
p0025 A82-18716

Anomalous wind estimates from the Seasat scatterometer
p0026 A82-18724

Determination of surface wind speed from remotely measured whitecap coverage, a feasibility assessment
p0030 N82-14565

WINTER
Ice conditions in the eastern Bering Sea from NOAA and LANDSAT imagery: Winter conditions 1974, 1976, 1977, 1979
[PB81-220188] p0028 N82-11537

Winterkill indicator model. Crop Condition Assessment Division (CCAD) data base interface driver, user's manual
[E82-10014] p0005 N82-15492

WISCONSIN
Remote sensing that motivated community action
p0008 A82-12594

The operational use of Landsat for lake quality assessment
p0036 A82-12596

A simulation study of the recession coefficient for antecedent precipitation index --- soil moisture and water runoff estimation
[NASA-TM-83860] p0038 N82-14549

WYOMING
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0021 N82-15489

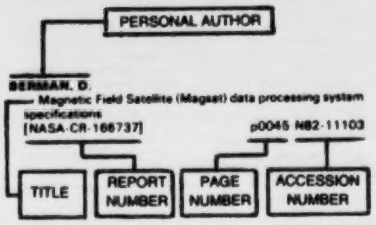
Y

YELLOWSTONE NATIONAL PARK (ID-MT-WY)
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0021 N82-15489

PERSONAL AUTHOR INDEX

EARTH RESOURCES / *A Continuing Bibliography (Issue 33)* **APRIL 1982**

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title, e.g., p0045 N82-11103. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

A

AARONS, J.
The radiowave propagation environment - Science and technology objectives for the 80's p0009 A82-18052

ABRAMS, R. B.
The surface albedo of the earth in the near ultraviolet /330-340 nm/ p0016 A82-15032

ACKERMANN, F.
Block adjustment with additional parameters p0049 A82-13738

ACUNA, M. H.
MAGSAT: Vector magnetometer absolute sensor alignment determination
[NASA-TM-79648] p0051 N82-10468

ADAMS, R. E. W.
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] p0010 N82-11514

AFREMOV, V. G.
Current aerial cameras p0050 A82-15655

AHMADJIAN, M.
Proof of concept study
[AD-A104338] p0010 N82-11639
Limit on remote FTIR detection of trace gases
[AD-A104842] p0011 N82-12511

AKEY, N. D.
Technology transfer of NASA microwave remote sensing system
[NASA-CR-165791] p0028 N82-11515

AKSENOV, V. V.
Main results of the Raduga experiment p0051 A82-16602

AL-MUFTI, S.
Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy
[PREPRINT-69] p0020 N82-12713

ALBEROTANZA, L.
Multitemporal calibration of LANDSAT images: A method for improving the marine phenomena recognition, with as example the Venice lagoon p0046 N82-14578

ALBUISSON, M.
Oil spills: Large scale monitoring by LANDSAT p0012 N82-14572

ALEXANDER, R. H.
Adaptation of land use to surficial geology in metropolitan Washington, D.C. p0010 N82-11718

ALLAN, T. D.
A preliminary evaluation of Seasat performance over the area of JASIN and its relevance to ERS-1 p0031 N82-14567

AMER, F. A. A. F.
Theoretical reliability of elementary photogrammetric procedures. I p0043 A82-16163

ANAEJIONU, P.
Report on Skylab 4 African drought and arid land experiment p0037 N82-12501

ANDERSON, H. N.
Stand density estimation on panoramic transparencies p0002 A82-10862

ANDERSON, J. A.
Aircraft data summaries of the SURE intensives, volume 4
[DE82-900311] p0012 N82-13569

ANDERSON, T. H.
Geological features of southwestern North America p0020 N82-12495

ARNAL, B.
Aerial-photography flights over Upper Franconia in 1980 - Operation and first application-related experience p0008 A82-15749

ARUMOV, G. P.
Investigation of the spatial structure of space images of the earth's surface p0044 A82-16626

ASCE, M.
Remote sensing study of sinkhole occurrence p0019 A82-12590

ASLAM, A.
Progress in radar snow research
[NASA-CR-166709] p0038 N82-12510

AUSTIN, G. L.
Analysis of bright bands from 3-D radar data p0035 A82-10208

AVANESOV, G. A.
Experimental telemetry system based on the Fragment multispectral scanning system p0050 A82-15955
Metrological support of measurements of earth-surface brightness by the Fragment multispectral scanning system p0050 A82-15958
Spectrometric studies of the earth's surface p0043 A82-16612

B

BAHN, G. S.
Synoptic thermal and oceanographic parameter distributions in the New York Bight Apex p0023 A82-12885
Analysis of testbed airborne multispectral scanner data from Superflux II p0027 N82-10682

BALDASSINIFONTANA, R.
Infrared radiance model variation by sensor flight measurements p0052 N82-14171

BALICK, L. K.
Inclusion of a simple vegetation layer in terrain temperature models for thermal infrared (IR) signature prediction
[AD-A104469] p0003 N82-11910

BALL, W. E., JR.
Bureau of Land Management satellite Doppler positioning techniques p0015 A82-10057

BALTER, B. M.
The maximum mean accuracy of classification of remote sensing objects and the influence on this accuracy of data acquisition and processing methods p0044 A82-16615

BARNES, J. C.
Snow-mapping experiment p0037 N82-12498

BARRICK, D. E.
Ocean surface height-slope probability density function from SEASAT altimeter echo p0024 A82-15076

BARTASHEVICH, A. A.
Methodology and practice of spectroscopic measurements of landscape elements in the preparation and carrying out of down-looking experiments p0051 A82-16613

BARTLETT, D. S.
In situ spectral reflectance studies of tidal wetland grasses p0036 A82-15969

BARTON, I. J.
Water vapour absorption in the 3.5-4.2 micron atmospheric window p0023 A82-14586

BARTSCHI, B.
Limit on remote FTIR detection of trace gases
[AD-A104842] p0011 N82-12511

BEFORT, W. A.
Stand density estimation on panoramic transparencies p0002 A82-10862

BELL, G. J.
The near-infrared radiation received by satellites from clouds p0025 A82-17492

BENSON, A. S.
Application of remote sensing to selected problems within the state of California
[E82-10004] p0004 N82-15482

BERG, C. P.
Mapping of the 1978 Kentucky River Flood from NOAA-5 satellite thermal infrared data p0035 A82-10033

BERMAN, D.
Magnetic Field Satellite (Magsat) data processing system specifications
[NASA-CR-166737] p0045 N82-11103

BEVEN, K. J.
The effect of spatial variability in precipitation on streamflow
[AD-A105955] p0038 N82-14589

BHATTACHARYYA, B. K.
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] p0022 N82-15506

BIRIUKOV, IU. L.
Calculation of the decrease in the contrast of objects of a place due to light scattering in the atmosphere p0042 A82-13633

BLACK, P. G.
Some aspects of tropical storm structure revealed by handheld-camera photographs from space p0011 N82-12507

BLAD, B. L.
Remote sensing of crop moisture status p0003 A82-17997

BLAHA, G.
Seasat altimetry adjustment model including tidal and other sea surface effects
[AD-A104188] p0026 N82-10473

BLANCHARD, B. J.
A simulation study of the recession coefficient for antecedent precipitation index
[NASA-TM-83860] p0038 N82-14549

BLUMENTHAL, D. L.
Aircraft data summaries of the SURE intensives, volume 4
[DE82-900311] p0012 N82-13569

BLYSTRA, A. R.
Application of Landsat to the inventory of DAMS p0036 A82-12593

BOGGS, D. H.
Evaluation of the Seasat wind scatterometer p0025 A82-18716

BONDELID, T. R.
Comparison of conventional and remotely sensed estimates of runoff curve numbers in southeastern Pennsylvania p0035 A82-10031

BOSTROEM, R.
A Swedish proposal for an EISCAT/GEOS-2 experiment
[KGI-176] p0052 N82-10484

BOWKER, D. E.
Analysis of testbed airborne multispectral scanner data from Superflux II p0027 N82-10682

BOWLEY, C. J.
Snow-mapping experiment p0037 N82-12498

BRACALENTE, E. M.
Evaluation of the Seasat wind scatterometer p0025 A82-18716

BRADLEY, G. A.
Aircraft radar response to soil moisture p0003 A82-17564

BREED, C. S.
Desert sand seas p0020 N82-12493

BRENDLE, P.
Overall economic impact of an operational Meteosat system
[ESA-CR(P)-1457] p0056 N82-13010

BROCK, R.
Factorial analysis of terrain feature positioning parameters used in combining radar and digital terrain model data p0015 A82-10029

BROICHER, H.
An investigation into the applicability of thermal infrared scanning for exploration
[BMFT-FB-T-81-087] p0022 N82-15925

BROWN, R. A.
Evaluation of the Seasat wind scatterometer p0025 A82-18716

BROWN, W. E., JR.
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] p0010 N82-11514

BROWNLEE, R. H.
Remote sensing that motivated community action p0008 A82-12594

BRYAN, M. L.
Optically processed Seasat radar mosaic of Florida
p0042 A82-15125

BUKHARIN, V. D.
Determination of the length of sea waves by an airborne radar technique
p0024 A82-15213

BURKE, H. H. K.
An evaluation of the spatial resolution of soil moisture information
[NASA-CR-166724] p0009 N82-11513
Analysis of soil moisture extraction algorithm using data from aircraft experiments
[NASA-CR-166719] p0046 N82-13470

BURNASH, R. J. C.
A systems approach to the real-time runoff analysis with a deterministic rainfall-runoff model
[PB81-224495] p0037 N82-11530

BUSINGER, J. A.
Anomalous wind estimates from the Seasat scatterometer
p0026 A82-18724

BYRNE, G. F.
Thermal inertia, thermal admittance, and the effect of layers
p0008 A82-15027
Use of visible and thermal satellite data to monitor an intermittently flooding marshland
p0036 A82-15037

C

CAHILL, L. J., JR.
Magnetic field observations on DE-A and -B
p0051 A82-16447

CAMAGNI, P.
Study of stack emissions by combination of lidar and correlation spectrometer
p0008 A82-12816

CAMPBELL, J. W.
Chesapeake Bay Plume Study: Superflux 1980
[NASA-CP-2188] p0026 N82-10661
Superflux I, II, and III experiment design. Remote sensing aspects
p0027 N82-10664
Assessment of Superflux relative to remote sensing
p0028 N82-10694

CAMPBELL, W. J.
Visual observations of floating ice from Skylab
p0037 N82-12504
The Norwegian remote sensing experiment (Norsex) in a marginal ice zone
p0031 N82-14566

CANDIDI, M.
Use of hydromagnetic waves to map geomagnetic field lines
p0016 A82-16868

CANTERFORD, R. P.
Satellite rainfall estimation for hydrologic forecasting
p0035 A82-10032

CARLSON, C. T.
Oceanic wind and balanced pressure-height fields derived from satellite measurements
p0023 A82-13214

CARLSON, T. N.
Radiative heating rates and some optical properties of the St. Louis aerosol, as inferred from aircraft measurements
p0008 A82-14320

CARLYLE, S. M.
The discrimination of winter wheat using a growth-state signature
p0002 A82-15026

CARMICHAEL, J.
Shuttle applications in tropospheric air quality observations
[NASA-CR-145374] p0010 N82-11635

CARNEGGIE, D. M.
Vegetation patterns
p0004 N82-12500

CARTER, C. R.
Three bearing method for passive triangulation in systems with unknown deterministic biases
p0050 A82-15920

CARTER, L. D.
Visual observations of the ocean
p0028 N82-12502

CARTER, W. E.
Report of survey for McDonald Observatory, Harvard Radio Astronomy Station, and vicinity
[PB81-234338] p0016 N82-13606

CASAS, J. C.
A new method for inferring carbon monoxide concentrations from gas filter radiometer data
p0009 A82-16837

CASPER, J. W.
Remote sensing study of sinkhole occurrence
p0019 A82-12590

CHAN, F. K.
Distortion-free mapping of VISSR imagery data from geosynchronous satellites
p0051 N82-10071

CHELTON, D. B.
Global satellite measurements of water vapour, wind speed and wave height
p0051 A82-17165

CHESNOKOV, IU. M
Main results of the Raduga experiment
p0051 A82-16602
Analog methods for processing multispectral photographs
p0044 A82-16623

CHOUDHURY, B. J.
A comparison of radiative transfer models for predicting the microwave emission from soils
p0035 A82-10694
A simulation study of the recession coefficient for antecedent precipitation index
[NASA-TM-83860] p0038 N82-14549

CHUANG, S. L.
Radiative transfer theory for passive microwave remote sensing of random media
p0049 A82-11533

CITEAU, J.
A short review of an oceanographic use of Meteosat data by the ORSTOM remote sensing service
p0031 N82-14570

CLARK, D. K.
Clear water radiances for atmospheric correction of coastal zone color scanner imagery
p0025 A82-17292

COFER, W. R., III
Automated analyzer for aircraft measurements of atmospheric methane and total hydrocarbons
p0007 A82-11949

COGAN, J. L.
Sensitivity analysis of a mesoscale moisture model
[AD-A101528] p0012 N82-14590

COHEN, S. H.
An evaluation of the spatial resolution of soil moisture information
[NASA-CR-166724] p0009 N82-11513

COHENDET, P.
Overall economic impact of an operational Meteosat system
[ESA-CR(P)-1457] p0055 N82-13010

COLES, R. L.
The reduction, verification and interpretation of Magsat magnetic data over Canada
[E82-10006] p0046 N82-15484

COLLIER, C. G.
Analysis of bright bands from 3-D radar data
p0035 A82-10208

COLLINS, J. G.
Airborne laser acquisition of cross-section data
p0049 A82-12600

COLWELL, R. N.
Application of remote sensing to selected problems within the state of California
[E82-10004] p0004 N82-15482

CONSTANS, J.
Requirements in pollution monitoring and coastal management
p0030 N82-14558

CONWAY, C. M.
Geological features of southwestern North America
p0020 N82-12495

COTTRELL, D. A.
Wheat cultivation: Identification and estimation of areas using LANDSAT data
[E82-10007] p0004 N82-15485

CRACKNELL, A. P.
Coastal zone research using remote sensing techniques
p0031 N82-14571

CRAWFORD, J.
The Norwegian remote sensing experiment (Norsex) in a marginal ice zone
p0031 N82-14566

CRISSMAN, B. W.
Monitoring the Chesapeake Bay using satellite data for Superflux III
p0027 N82-10668

CRIST, E. P.
Development and evaluation of an automatic labeling technique for spring small grains
[E82-10001] p0004 N82-15480

CROSS, G. H.
Repetitive aerial photography for assessing marsh vegetation changes
p0001 A82-10048

CULBERT, T. P.
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] p0010 N82-11514

CURRIE, N. C.
Reflectivity and emissivity of snow and ground at mm waves
p0042 A82-14860

D

DABROWSKA-ZIELINSKA, K.
Use of visible and thermal satellite data to monitor an intermittently flooding marshland
p0036 A82-15037

DALEY, C.
An evaluation of Seasat-A data in relation to optimum track ship weather routing and site specific forecasting for the offshore oil industry
p0030 N82-14564

DAUDRETSCH, F. C.
Rural development in the humid tropics
p0003 A82-16162

DAVIES, B. D.
CTD/02 measurements during the Equatorial Pacific Ocean Climate Study (EPOCS) in 1979
[PB81-211203] p0026 N82-10461

DAVIES, M. E.
Coordinates of features on the Galilean satellites
p0019 A82-12366

DAVIS, H. W.
The determination of navigational and meteorological variables measured by NOAA/RFC WP3D aircraft
[PB81-225468] p0028 N82-11743

DAVIS, J. R.
Thermal inertia, thermal admittance, and the effect of layers
p0008 A82-15027

DAWSON, E.
The reduction, verification and interpretation of Magsat magnetic data over Canada
[E82-10006] p0046 N82-15484

DE BLUST, E.
Study of stack emissions by combination of lidar and correlation spectrometer
p0008 A82-12816

DE GROOT, M.
Study of stack emissions by combination of lidar and correlation spectrometer
p0008 A82-12816

DE LOOR, G. P.
The observation of tidal patterns, currents, and bathymetry with SLAR imagery of the sea
p0023 A82-11201

DECKER, M. T.
The influence of gravity waves on radiometric measurements - A case study
p0049 A82-13547

DEGNER, J. D.
Remote sensing study of sinkhole occurrence
p0019 A82-12590

DEJESUSPARADA, N.
Wheat cultivation: Identification and estimation of areas using LANDSAT data
[E82-10007] p0004 N82-15485
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10008] p0039 N82-15486
Remote sensing in forestry: Application to the Amazon region
[E82-10012] p0005 N82-15490

DELGRECO, F. P.
Proof of concept study
[AD-A104338] p0010 N82-11639

DELIMAEFERNANDOCELSOSOARESMAIA, A. M.
Wheat cultivation: Identification and estimation of areas using LANDSAT data
[E82-10007] p0004 N82-15485

DELKER, C. V.
Measurements of radar backscatter from Arctic Sea ice in the summer
[AD-A105586] p0032 N82-14592
Measurements of radar backscatter from Arctic Sea ice in the summer. Appendices A and B
[AD-A105736] p0032 N82-14593

DELOOR, G. P.
Project Noordwijk. Part 1: Measurements of the radar backscatter coefficient gamma (sigma deg) in 1977 and 1978
[PHL-1979-49-PT-1] p0032 N82-14617

DEMAN, G.
Airborne remote sensing of the coastal zone
p0053 N82-14577

DENCE, M. R.
The Manicouagan impact structure observed from Skylab
[CONTRIB-544] p0020 N82-12497

DENNIS, J. M.
Remote sensing that motivated community action
p0006 A82-12594

DOERING, J. P.
Magnetic field-aligned electron distributions in the dayside cusp
p0015 A82-12186

DOMAIN, F.
A short review of an oceanographic use of Meteosat data by the ORSTOM remote sensing service
p0031 N82-14570

DOSSANTOS, A.
Remote sensing in forestry: Application to the Amazon region
[E82-10012] p0005 N82-15490

DOZIER, J.
Effect of grain size and snowpack water equivalence on visible and near-infrared satellite observations of snow
p0035 A82-12553
Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227795] p0039 N82-15673

DUCHOSSOIS, G.
ERS-1: Mission objectives and system concept
p0029 N82-14554

DUGGIN, M. J.
The effect of angular factors on popularly used indicators of vegetative vigor
p0001 A82-10039
Limitations in the spectral discrimination of the Landsat MSS
p0001 A82-10046
Intercalibration of Landsat 1-3 and NOAA 6 and 7 scanner data
p0049 A82-13293

DUMAS, R. R.
Application of Landsat to the inventory of DAMS
p0036 A82-12593

DUNN, C. W., JR.
Mapping vegetation association boundaries with Landsat MSS data - An Oklahoma example
p0001 A82-10041

E

EFREMOVA, O. N.
Study of the dynamics of the Danube delta using space images
p0036 A82-15861

EGOROV, V. V.
Images of sea waves obtained in polarimetric surveys
p0024 A82-16620
The choice of the orientation of the analyzer in polarimetric surveys
p0044 A82-16621
Analysis of the information content of the polarimetric method of remote sensing
p0003 A82-16622
Investigation of the spatial structure of space images of the earth's surface
p0044 A82-16626

EGOROVA, O. I.
Concerning the geometric accuracy of infrared scanner photographs
p0042 A82-13634

EINAUDI, F.
The influence of gravity waves on radiometric measurements - A case study p0049 A82-13547

ELLIS, P. J.
Limitations in the spectral discrimination of the Landsat MSS p0001 A82-10046

ENDLICH, R. M.
Oceanic wind and balanced pressure-height fields derived from satellite measurements p0023 A82-13214

ENSLIN, W. R.
Introducing remote sensing to county-level agencies in Michigan through the Cooperative Extension Service p0007 A82-10034

EOM, H. J.
A theory of wave scattering from an inhomogeneous layer with an irregular interface p0041 A82-12757

EPIPHANIO, J. C. N.
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10008] p0039 N82-15486

ERB, T. L.
Remote sensing for vineyard management p0001 A82-10047

ESAIAS, W. E.
Superflux I, II, and III experiment design: Remote sensing aspects p0027 N82-10664

ESTES, J. E.
Application of remote sensing to selected problems within the state of California
[E82-10004] p0004 N82-15482

ESTOQUE, M. A.
Analysis of SEASAT wind observations over the Indian Ocean p0023 A82-10671

EVANS, D. L.
Identification of lithologic units using multichannel imaging systems p0046 N82-11509

EVANS, J. B.
Water temperature mapping by infrared scanner p0036 A82-12598

F

FAELTHAMMAR, C. G.
A Swedish proposal for an EISCAT/GEOS-2 experiment
[KGI-175] p0052 N82-10484

FAINTICH, M.
Digital image technology - MC&G impact p0015 A82-10028

FARNSWORTH, R. K.
Satellite rainfall estimation for hydrologic forecasting p0035 A82-10032

FARRELLY, B.
The Norwegian remote sensing experiment (Norsex) in a marginal ice zone p0031 N82-14566

FARTHING, W. H.
Magnetic field observations on DE-A and -B p0051 A82-16447

FAVIN, S.
Distant magnetic field effects associated with Birkeland currents /made possible by the evaluation of TRIAD's attitude oscillations/ p0015 A82-12215

FEIN, J.
Mesoscale cloud features observed from Skylab p0011 N82-12509

FELT, R. Y.
U.S. Navy planning for satellite oceanographic data exploitation
[AAS 81-072] p0024 A82-16341

FERNANDEZ-PARTAGAS, J. J.
Analysis of SEASAT wind observations over the Indian Ocean p0023 A82-10671

FERNANDEZ, D.
Remote sensing for vineyard management p0001 A82-10047

FERRAL, R. L.
A systems approach to the real-time runoff analysis with a deterministic rainfall-runoff model

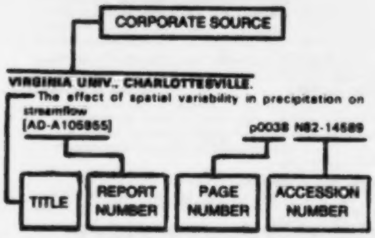
CORPORATE SOURCE INDEX

EARTH RESOURCES / *A Continuing Bibliography (Issue 33)* **APRIL 1982**

Typical Corporate Source Index Listing



CORPORATE SOURCE
VIRGINIA UNIV., CHARLOTTESVILLE.
The effect of spatial variability in precipitation on streamflow
[AD-A105855]
p0038 N82-14589
TITLE
REPORT NUMBER
PAGE NUMBER
ACCESSION NUMBER

The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

Small-scale terrain mapping based on numerical interpretation of LANDSAT imagery
[VTT-40] p0045 N82-10485

TEXAS UNIV. AT ARLINGTON.
A global atlas of GEOS-3 significant waveheight and comparison of the data with national buoy data
p0026 N82-10660

TEXAS UNIV. AT AUSTIN.
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab
p0020 N82-12494

Cultural features imaged and observed from Skylab 4
p0010 N82-12499

U

UNIVERSITY COLL., CARDIFF (WALES).
Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy
[PREPRINT-69] p0020 N82-12713

UNIVERSITY COLL., DUBLIN (IRELAND).
Study on calibration methods for Earth observation optical imaging instruments
[UCD-207/1/80] p0052 N82-10488

UNIVERSITY COLL., GALWAY (IRELAND).
Determination of surface wind speed from remotely measured whitecap coverage, a feasibility assessment
p0030 N82-14565

The feasibility of using remotely sensed color as an index of Irish coastal water properties p0032 N82-14581

UTAH STATE UNIV., LOGAN.
Proof of concept study
[AD-A104338] p0010 N82-11639
Limit on remote FTIR detection of trace gases
[AD-A104842] p0011 N82-12511

UTAH UNIV., SALT LAKE CITY.
Morphostructural analyses of space imagery in the central Colorado Plateau p0019 N82-10465

V

VIRGINIA UNIV., CHARLOTTESVILLE.
The effect of spatial variability in precipitation on streamflow
[AD-A105955] p0038 N82-14589

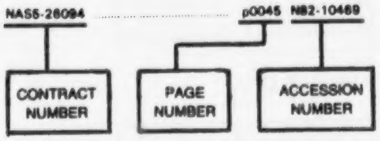
WASHINGTON UNIV., SEATTLE.
Evaluation of the Seasat wind scatterometer
p0025 A82-18716

Anomalous wind estimates from the Seasat scatterometer p0026 A82-18724
Identification of lithologic units using multichannel imaging systems p0046 N82-11509
Adaptation of land use to surficial geology in metropolitan Washington, D.C. p0010 N82-11718

WISCONSIN UNIV. - MADISON.
The operational use of Landsat for lake quality assessment p0036 A82-12596

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

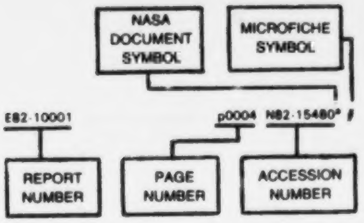
REPORT/ACCESSION NUMBER INDEX

EARTH RESOURCES / *A Continuing Bibliography (Issue 33)* **APRIL 1982**

Typical Report/Accession Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

16. Abstract

This bibliography list 436 reports, articles, and other documents introduced into the NASA Scientific and Technical Information System between January 1 and March 31, 1982. Emphasis is placed on the use of remote sensing and geophysical instrumentation in spacecraft and aircraft to survey and inventory natural resources and urban areas. Subject matter is grouped according to agriculture and forestry, environmental changes and cultural resources, geodesy and cartography, geology and mineral resources, hydrology and water management, data processing and distribution systems, instrumentation and sensors, and economic analysis.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley
COLORADO
University of Colorado, Boulder
DISTRICT OF COLUMBIA
Library of Congress
GEORGIA
Georgia Institute of Technology, Atlanta
ILLINOIS
The John Crerar Library, Chicago
MASSACHUSETTS
Massachusetts Institute of Technology, Cambridge
MISSOURI
Linda Hall Library, Kansas City
NEW YORK
Columbia University, New York
OKLAHOMA
University of Oklahoma, Bizzell Library
PENNSYLVANIA
Carnegie Library of Pittsburgh
WASHINGTON
University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA
Los Angeles Public Library
San Diego Public Library
COLORADO
Denver Public Library
CONNECTICUT
Hartford Public Library
MARYLAND
Enoch Pratt Free Library, Baltimore
MASSACHUSETTS
Boston Public Library
MICHIGAN
Detroit Public Library
MINNESOTA
Minneapolis Public Library and Information Center
NEW JERSEY
Trenton Public Library
NEW YORK
Brooklyn Public Library
Buffalo and Erie County Public Library
Rochester Public Library

OHIO
Akron Public Library
Cincinnati and Hamilton County Public Library
Cleveland Public Library
Dayton Public Library
Toledo and Lucas County Public Library
TEXAS
Dallas Public Library
Fort Worth Public Library
WASHINGTON
Seattle Public Library
WISCONSIN
Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

NAS 1.21:

ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges.

STAR (N-10000 Series)	N82-16040 - N82-22140
IAA (A-10000 Series)	A82-18840 - A82-28538

This bibliography was prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by PRC Government Information Systems.

NASA SP-7041(34)

EARTH RESOURCES

A CONTINUING BIBLIOGRAPHY WITH INDEXES

Issue 34

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced between April 1 and June 30, 1982 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

NASA Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

This supplement is available as NTISUB/038/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $10.50 domestic; $21.50 foreign for standing orders. Please note: Standing orders are subscriptions which do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

INTRODUCTION

The technical literature described in this continuing bibliography may be helpful to researchers in numerous disciplines such as agriculture and forestry, geography and cartography, geology and mining, oceanography and fishing, environmental control, and many others. Until recently it was impossible for anyone to examine more than a minute fraction of the Earth's surface continuously. Now vast areas can be observed synoptically, and changes noted in both the Earth's lands and waters, by sensing instrumention on orbiting spacecraft or on aircraft.

This literature survey lists 567 reports, articles, and other documents announced between April 1 and June 30, 1982 in *Scientific and Technical Aerospace Reports (STAR)*, and *International Aerospace Abstracts (IAA).*

The coverage includes documents related to the identification and evaluation by means of sensors in spacecraft and aircraft of vegetation, minerals, and other natural resources, and the techniques and potentialities of surveying and keeping up-to-date inventories of such riches. It encompasses studies of such natural phenomena as earthquakes, volcanoes, ocean currents, and magnetic fields; and such cultural phenomena as cities, transportation networks, and irrigation systems. Descriptions of the components and use of remote sensing and geophysical instrumentation, their subsystems, observational procedures, signature and analyses and interpretive techniques for gathering data are also included. All reports generated under NASA's Earth Resources Survey Program for the time period covered in this bibliography will also be included. The bibliography does not contain citations to documents dealing mainly with satellites or satellite equipment used in navigation or communication systems, nor with instrumentation not used aboard aerospace vehicles.

The selected items are grouped in nine categories. These are listed in the Table of Contents with notes regarding the scope of each category. These categories were especially chosen for this publication, and differ from those found in *STAR* and *IAA*.

Each entry consists of a standard bibliographic citation accompanied by an abstract. The citations and abstracts are reproduced exactly as they appeared originally in *STAR*, or *IAA*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the variation in citation appearance.

Under each of the nine categories, the entries are presented in one of two groups that appear in the following order:

IAA entries identified by accession number series A82-10,000 in ascending accession number order;

STAR entries identified by accession number series N82-10,000 in ascending accession number order.

After the abstract section, there are five indexes:

subject, personal author, corporate source, contract number and report/accession number.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service. American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction)

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

TABLE OF CONTENTS

Page

Category 01 Agriculture and Forestry 57
Includes crop forecasts, crop signature analysis, soil identification, disease detection, harvest estimates, range resources, timber inventory, forest fire detection, and wildlife migration patterns.

Category 02 Environmental Changes and Cultural Resources 73
Includes land use analysis, urban and metropolitan studies, environmental impact, air and water pollution, geographic information systems, and geographic analysis.

Category 03 Geodesy and Cartography 81
Includes mapping and topography.

Category 04 Geology and Mineral Resources 89
Includes mineral deposits, petroleum deposits, spectral properties of rocks, geological exploration, and lithology.

Category 05 Oceanography and Marine Resources 93
Includes sea-surface temperature, ocean bottom surveying imagery, drift rates, sea ice and icebergs, sea state, fish location

Category 06 Hydrology and Water Management 101
Includes snow cover and water runoff in rivers and glaciers, saline intrusion, drainage analysis, geomorphology of river basins, land uses, and estuarine studies.

Category 07 Data Processing and Distribution Systems 111
Includes film processing, computer technology, satellite and aircraft hardware, and imagery.

Category 08 Instrumentation and Sensors 125
Includes data acquisition and camera systems and remote sensors.

Category 09 General 137
Includes economic analysis.

WINTERKILL INDICATOR MODEL, CROP CONDITION ASSESSMENT DIVISION (CCAD) DATA BASE INTERFACE DRIVER, USER'S MANUAL
R. F. Hansen, Principal Investigator Mar. 1981 13 p ref
Sponsored by NASA, USDA, Dept. of Commerce, Dept. of Interior, and Agency for International Development ERTS
(Contract NAS9-15800; Proj. AgRISTARS)
(E82-10014; NASA-CR-161031; EW-L1-00713; LEMSCO-16033; JSC-17117) Avail: NTIS HC A02/MF A01 CSCL 02C

Instructions are given for using the Winterkill indicator model CCAD data base interface driver. The purpose of the system is to interface the Winterkill Indicator Model with the CCAD operational data base. The interface driver routine decides what meteorological stations should be processed and calls the proper subroutines to process the stations. Author

A82-17841 * # **Results from the July 1981 Workshop on Passive Remote Sensing of the Troposphere.** L. S. Keafer, Jr. and H. G. Reichle, Jr. (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0207.* 8 p. 6 refs.

Potential roles of passive remote sensors in the study of the chemistry and related dynamics of the lower atmosphere were defined by a Tropospheric Passive Remote Sensing Workshop, and technology advances required to implement these roles were identified. A promising role is in making global-scale, multilayer measurements of the more abundant trace tropospheric gaseous species (e.g., O3, CO, CH4, HNO3) and of aerosol thickness and size distribution. It includes both nadir- and limb-viewing measurements. Technology advances focus on both scanning- and fixed-spectra, nadir-viewing techniques with resolutions of 0.1 kaysers or better. Balloon- and Shuttle-borne experiments should be performed to study the effects of instrument noise and background fluctuations on data inversion and to determine the utility of simultaneously obtained nadir- and limb-viewing data. A82-19529 # Soil moisture determination - Experiments with passive microwave radiometers. P. Meylan, C. Morzier, R. Caloz (Lausanne, Ecole Polytechnique Fédérale, Lausanne, Switzerland), E. Schanda, and Ch. Matzler (Bern, Universität, Berne, Switzerland). In: European Microwave Conference, 10th, Warsaw, Poland, September 8-12, 1980, Proceedings. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 256-260. 5 refs.

Long term observational programs have been followed in 1977 and 1978 for the determination of the relationship between emissivity and soil moisture on three test sites, representing three soil types. Five radiometers, whose frequencies are centered at 36, 21, 10.5, 4.9 and 1.8 GHz, were used. The interpretation of the measurements follows three ways: (1) analysis of the radiometer response versus scan angle; (2) factorial analysis of correspondences and clustering analysis; and (3) analysis of emissivity variation versus soil moisture content. In this last case a nonlinear function was fitted to the data and could be partially explained. An experiment was also conducted to determine the real penetration depth in a heavy soil. (Author)

A82-20349 † Experimental evaluation of methods of the automated interpretation of crops from a Fragment MSS image (Eksperimental'naia otsenka metodov avtomatizirovannogo deshifrirovaniia sel'skokhoziaistvennykh kul'tur po snimku s MSS 'Fragment'). I. A. Labutina and I. K. Lur'e (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). *Issledovanie Zemli iz Kosmosa,* Nov.-Dec. 1981, p. 89-92. In Russian.

Three methods of automated photointerpretation are examined and compared: the minimum distance method, the maximum likelihood method, and cluster analysis. The comparison involved crop identification from a Fragment MSS image of an area between the Don and Khoper rivers. Recommendations on the organization of automated image processing are given. B.J.

A82-20350 † Automation of the processing of aerial and space images for forest inventory (Avtomatizatsiia protsessa obrabotki aerokosmicheskikh snimkov v tseliakh inventarizatsii lesov). A. S. Alekseev, S. V. Vasil'ev, V. G. Mozalevskii, V. P. Piatkin, V. N. Sedykh, and V. S. Sidorova (Akademiia Nauk SSSR, Vychislitel'nyi Tsentr and Institut Lesa i Drevesiny, Novosibirsk, USSR). *Issledovanie Zemli iz Kosmosa,* Nov.-Dec. 1981, p. 93-100. 6 refs. In Russian.

Various aspects of the automated processing of remotely sensed images for purposes of forest inventory are considered. Particular attention is given to the use of textural features for image classification. B.J.

A82-20408 Manual and automatic crop identification with airborne radar imagery. B. Brisco and R. Protz (Guelph, University, Guelph, Ontario, Canada). *Photogrammetric Engineering and Remote Sensing,* vol. 48, Jan. 1982, p. 101-109. 16 refs. Department of Supply and Services Contract No. 08SU-01525-7-0198.

Woods, roughland and corn were identified with accuracies approaching or exceeding 90%, when image tone and texture were employed as the key discriminants, in manual and automatic crop discrimination by means of multi-date radar imagery. Hay-pasture and grain fields were, however, consistently confused, leading to identification accuracies of only about 50%. It is found that, while image enhancement prior to supervised classification was useful, increased class confusion resulted from the lack of textural information in the digital classification and its consequent overlapping of tonal distributions for the five investigated classes. For the more accurate identification of hay-pasture and grain fields, it is suggested that imagery be collected during the growing season. At that time, the two crop types exhibit the greatest difference in geometrical and dielectric properties. O.C.

A82-20422 * # Simple radiative transfer model for relationships between canopy biomass and reflectance. J. K. Park (Systems and Applied Sciences Corp., Riverdale, MD) and D. W. Deering (NASA, Goddard Space Flight Center, Earth Survey Applications Div., Greenbelt, MD). *Applied Optics,* vol. 21, Jan. 15, 1982, p. 303-309. 25 refs.

A modified Kubelka-Munk model has been utilized to derive useful equations for the analysis of apparent canopy reflectance. Based on the solution to the model simple working equations were formulated by employing reflectance characteristic parameters. The relationships derived show the asymptotic nature of reflectance data that is typically observed in remote sensing studies of plant biomass. They also establish the range of expected apparent canopy reflectance values for specific plant canopy types. The usefulness of the simplified equations was demonstrated by the exceptionally close fit of the theoretical curves to two separately acquired data sets for alfalfa and shortgrass prairie canopies. (Author)

A82-21026 The Dutch ROVE program. G. P. de Loor, P. Hoogeboom (Centrale Organisatie voor Toegepost-Natuurwetenschappelijk Onderzoek, Physisch Laboratorium TNO, The Hague, Netherlands), and E. P. W. Attema (Delft, Technische Hogeschool, Delft, Netherlands). *IEEE Transactions on Geoscience and Remote Sensing,* vol. GE-20, Jan. 1982, p. 3-11. 22 refs.

The Netherlands Radar Observation of Vegetation (ROVE) team efforts to employ radar as an all-weather, day and night remote sensing technique for observation and control of crops is described. Experiments involving X-band radar from TV towers, an X-band FM/CW system on rails, and an EMI X-band SLAR are reviewed and ground-based and airborne data collection and data are compared. Calibration angles for ground based observations of vegetation are under study, and a grazing angle of 75 deg has been found necessary for measuring soil moisture from the ground. Resolutions in white, black, and grey have been established for sugar beets, wheat, and potatoes, respectively, using airborne radar. Further programs are under way to define the effects on imaging of climate, season, irrigation, soil properties, soil treatment, sowing procedures, and fertilization. M.S.K.

A82-21028 Microwave radiometry of lands under natural and artificial moistening. A. M. Shutko (Akademiia Nauk SSSR, Institut Radiotekhniki i Elektroniki, Moscow, USSR). *IEEE Transactions on Geoscience and Remote Sensing,* vol. GE-20, Jan. 1982, p. 18-26. 13 refs.

The dielectric properties of soils and soil conditions are examined for the applications of microwave radiometry to agriculture, hydrogeology, and land reclamation. Fundamental relations are defined between radiation and soil-moisture content, and characteristics of the microwave emissivity of nonuniform moistened ground with either a flat or rough surface are analyzed. The effects of the uniformity or nonuniformity of the soil, of subsoil water, and of daily temperature variations are examined. Accuracy is found to be diminished by the presence of vegetation, and examples of applications of microwave sensing in agricultural fields, for irrigation quality control, for estimating subsoil water, to find areas with excessive drainage, and to determine the hydrologic regime of dry salt lakes are discussed. M.S.K.

A82-21029 **Microwave radiation peculiarities of vegetative covers.** A. M. Shutko and A. A. Chukhlantsev (Akademiia Nauk SSSR, Institut Radiotekhniki i Elektroniki, Moscow, USSR). *IEEE Transactions on Geoscience and Remote Sensing,* vol. GE-20, Jan. 1982, p. 27-29.

Theoretical and experimental results for determining the spectral peculiarities of soil-vegetation systems are reported. Vegetation covers were grouped into grain crops, grass and alfalfa, wide-leaf crops such as corn and beets, and bushes and woods. The type of vegetation showed the most influence in the cm band, and the wide-leaf crops were found to display a decrease in emissivity with an increase in wavelength. The total attenuation in vegetative covers was examined, and showed that attenuation is proportional to the water content in vegetation, with a proportionality coefficient which depends on the type of vegetation and its state of growth. A model was developed to take into account the scattering and absorption cross sections, and a formula is presented for the total attenuation in the chosen vegetation model. M.S.K.

A82-21030 **Mixture formulas applied in estimation of dielectric and radiative characteristics of soils and grounds at microwave frequencies.** A. M. Shutko and E. M. Reutov (Akademiia Nauk SSSR, Institut Radiotekhniki i Elektroniki, Moscow, USSR). *IEEE Transactions on Geoscience and Remote Sensing,* vol. GE-20, Jan. 1982, p. 29-32. 12 refs.

A82-21031 **Investigation of the vegetative covers on ploughed areas by SLAR.** A. G. Geller, E. N. Zotova, and M. I. Naumov (Akademiia Nauk SSSR, Institut Radiotekhniki i Elektroniki, Moscow, USSR). *IEEE Transactions on Geoscience and Remote Sensing,* vol. GE-20, Jan. 1982, p. 32-35. 7 refs.

Results of SLAR investigations of crop condition and the correlation of dependencies between the mean intensity of reflected signals and the biometrical parameters of the crops are reported. The experiments were made using K-band SLAR with HH polarization at a grazing angle of 12-24 deg, and corn, sugar beets, and winter wheat were examined in the middle of the growth cycle. Microphotometric techniques were used to process the radar data, and the phytomass and crop moisture content parameters were chosen to describe the crop state. The 80% confidence limits for the regression functions are provided, and differences in the scattered signal intensities from wide-leaf crops are accounted for by differences in surface roughness characteristics. The desired antenna pattern was achieved in sensing angles from 68-72 deg, and the use of dual frequency, dual polarization, and a calibrated radar to improve system efficiency is indicated. M.S.K.

A82-21032 **Volumetric effects in cross-polarized airborne radar data.** A. J. Blanchard, R. W. Newton, L. Tsang, and B. R. Jean (Texas A & M University, College Station, TX). *IEEE Transactions on Geoscience and Remote Sensing,* vol. GE-20, Jan. 1982, p. 36-41. 14 refs.

Experimental results and theoretical models for the sensitivity of radar backscatter return to soil moisture as a function of incident angle and the sensibility of the cross polarized radar return to surface roughness are presented. Additional attention is devoted to establishing the accuracy of cross-polarized radar backscatter measurements by the identification of specific criteria in terms of integrated antenna polarization isolation. NASA scatterometers were used in test runs at 1.6, 4.75, and 13.3 GHz to detect soil moisture. The Kirchhoff scattering theory and the Blanchard and Rouse surface/volume theory were used to test predictions for like-polarized backscatter as a function of moisture and incident angle. Volume dependent measurements were found to be possible independent of surface effects and incident angle. M.S.K.

A82-21033 * **Crop classification using airborne radar and Landsat data.** F. T. Ulaby, R. Y. Li, and K. S. Shanmugan (University of Kansas Center for Research, Inc., Lawrence, KS). *IEEE Transactions on Geoscience and Remote Sensing,* vol. GE-20, Jan. 1982, p. 42-51. 21 refs. Contract No. NAS9-15421.

NASA 13.3 GHz airborne radar data from a soil moisture measurement analysis is used to investigate the statistical nature of the radar backscattering coefficient for bare ground and three different crop types, and to evaluate the crop classification rates using Landsat data alone or combined with the airborne survey. The scatterometer was a fan-beam Doppler system, VV polarized, and is considered only for 50 deg angles of incidence. A total of 36 fields were covered a week apart by the aircraft and Landsat, and Rayleigh statistics were used in the frequency averaging to eliminate fluctuations due to random fluctuations. Within-field variances were calculated for the Landsat and the radar data and used to design optimum crop classification procedures. The Landsat Band 4 readings were 67% accurate, and an increase in accuracy of 10% was achieved by the addition of the radar data. M.S.K.

A82-21092 **Use of Landsat data for automatic classification and area estimation of sugar-cane plantation in Sao Paulo state, Brazil.** F. J. Mendonça (Instituto de Pesquisas Espaciais, São José dos Campos, São Paulo, Brazil). *International Journal of Remote Sensing,* vol. 2, Oct.-Dec. 1981, p. 361-368. 11 refs.

A sugar-cane inventory study of plantations in Sao Paulo state, Brazil is presented, in which sugar-cane was automatically classified and its area was estimated using an interactive image analysis system (Image-100) and Landsat digital data. Ten segments, 10 x 20 km, were aerially photographed from May 27-June 12, 1978; two Landsat passes were also made in April and July/August, 1978. Crop density, field size, and spatial distribution were all found to influence the spectral characteristics of the study crop. Classification of sugar-cane was found to be most difficult in the dry season (April) and easiest in July/August. The study area covered four Landsat paths: 235, 236, 237, and 238. The percentages of overall correct classification for the fourth paths ranged from 79.56 percent for path 238 to 95.59 percent for path 237. A difference of only 12.57 percent was encountered between sugar-cane estimates using Landsat data and those which used data from the Institute for Agricultural Economy. J.F.

A82-21093 **The estimation of the surface moisture of a vegetated soil using aerial infrared photography.** P. J. Curran (Reading, University, Reading, Berks., England). *International Journal of Remote Sensing,* vol. 2, Oct.-Dec. 1981, p. 369-378. 12 refs. Natural Environment Research Council Grant No. GR3/4076.

A remote sensing method for estimating the surface soil moisture of a soil with an incomplete vegetation cover is discussed. It has been shown that when the percentage cover of leaves and nongreen vegetation are known and constant, and the effect of shadow is minimal, the near infrared bidirectional reflectance from the vegetation canopy is negatively related to surface soil moisture. The near infrared bidirectional reflectance, surface soil moisture, and vegetation cover were measured at ten heathland sites on 18 different dates. It was found that the Y axis intercept of a regression between ground-based measurements of near infrared bidirectional reflectance (Y) and the percentage of green vegetation cover (X) was linearly related to surface soil moisture. This relationship between soil moisture and canopy reflectance was used to estimate the surface soil moisture of vegetated heathland in five flights of black and white infrared aerial photography. The resulting estimates had an accuracy of + or - 18.4% at the 95% confidence level. J.F.

A82-22142 **An airphoto key for major tropical crops.** W. R. Philipson and T. Liang (Cornell University, Ithaca, NY). *Photogrammetric Engineering and Remote Sensing,* vol. 48, Feb. 1982, p. 223-233. 15 refs.

A key is presented for identifying selected major crops of the tropics through stereoscopic analysis of medium-scale (1:10,000 to 1:30,000) panchromatic aerial photographs. The development of the key is based on representative photographs of crops as they occur throughout the tropics. The key recognizes certain field, management, and crop features which are frequently associated with crop occurrence. It is pointed out that positive crop identification normally requires ground verification. Attention has been given to crops of sugar cane, coffee, bananas, pineapple, rice, corn, tobacco, rubber, coconut, and cacao. G.R.

A82-22144 **Multispectral photographic remote sensing of green vegetation biomass and productivity.** P. J. Curran (Reading, University, Reading, Berks., England). *Photogrammetric Engineering and Remote Sensing,* vol. 48, Feb. 1982, p. 243-250. 13 refs. Natural Environment Research Council Grant No. GR/3/1481.

An investigation was conducted with the objective to demonstrate the importance of productivity to the relationship between green biomass and a bidirectional reflectance ratio. Using bidirectional reflectance data derived photographically from 22 sets of near vertical aerial photography and 56 sets of oblique ground photography, it was determined that the amount of bidirectional reflectance ratio variance accounted for by green biomass could be increased by around 6 percent with the addition of productivity. On a pasture site with low green biomass but high productivity, the bidirectional reflectance ratio was higher than for a high green biomass pasture site with lower productivity. G.R.

A82-24961 **Influence of illumination and viewing geometry and atmospheric composition on the 'tasseled cap' transformation of Landsat MSS data.** J. V. Dave (IBM Scientific Center, Palo Alto, CA). *Remote Sensing of Environment,* vol. 11, Mar. 1981, p. 37-55. 15 refs.

Various characteristics of a simulated tasseled cap (representing the spectral-temporal characteristics of wheat fields, as observed by the Landsat MSS sensors) are investigated as a function of the viewing and illumination geometry parameters, and atmospheric composition. Measured spectral reflectances of ten wheat fields in various growth stages and the satellite-level radiances, computed after taking into account all orders of scattering, are used in this investigation. It is shown that the procedure for normalizing the measured radiances by the cosine of the solar zenith angle is a less accurate approximation, and that the characteristics of the tasseled cap both in the greenness-brightness and yellowness-brightness hyperplanes are significantly affected by the geometric as well as the atmospheric parameters. (Author)

A82-24963 * **HCMM detection of high soil moisture areas.** J. L. Heilman (South Dakota State University, Brookings, SD; Texas A & M University, College Station, TX) and D. G. Moore (South Dakota State University, Brookings, SD). *Remote Sensing of Environment,* vol. 11, Mar. 1981, p. 73-76. Contract No. NAS5-24206.

It is noted that one objective of NASA's Heat Capacity Mapping Mission (HCMM) is to evaluate the feasibility of using HCMM data to assess soil moisture effects by observing temperatures near the maximum and minimum of the diurnal temperature cycle. The satellite, which carries a two-channel radiometer (0.5-1.1 and 10.5-12.5 microns) gathers data at 1:30 P.M. and 2:30 A.M. local time at midlatitudes, with a repeat cycle of 5 or 16 days depending on latitude. The spatial resolutions are 0.5 x 0.5 km at nadir for the visible channel and 0.6 x 0.6 km at nadir for the thermal infrared channel. An example is presented here of HCMM detection of a region of high soil moisture. C.R.

A82-25457 **Assessing mesquite-grass vegetation condition from Landsat.** K. C. McDaniel (New Mexico State University, Las Cruces, NM) and R. H. Haas (U.S. Geological Survey, EROS Data Center, Sioux Falls, SD). *Photogrammetric Engineering and Remote Sensing,* vol. 48, Mar. 1982, p. 441-450. 24 refs. Research supported by the E. Paul and Helen Buck Waggoner Foundation.

Regression analyses with Landsat MSS data and vegetation data collected on four dates from six study sites show the two vegetation index models, TVI 6 and GVI, to be highly correlated with such vegetation parameters associated with growing vegetation as green cover, green yield, and plant moisture content. This is seen as an indication of the possibility of vegetation condition quantitative measurement with Landsat MSS data. Because it is shown that land management practices do not seriously affect the relationship of Landsat MSS models with rangeland vegetation parameters obtained from a common vegetation-soil system, the stratifying of relatively uniform vegetation soil systems on Landsat imagery appears to be a useful first step in the vegetation survey use of Landsat MSS data. O.C.

A82-26577 † **The spectral reflectance of certain soils (Spektral'naia otrazhatel'naia sposobnost' nekotorykh pochv).** P. P. Fedchenko and K. Ia. Kondrat'ev. Leningrad, Gidrometeoizdat, 1981. 232 p. 121 refs. In Russian.

The principal factors affecting the reflectance properties of soils are investigated. Methods are proposed for aircraft and laboratory measurements of the spectral luminance factors of soils. Spectrometers currently in use for studying the reflectance properties of natural topographic features are described. It is shown that the theory of statistical pattern recognition makes possible soil mapping on the basis of reflection spectra. C.R.

A82-26842 * **Use of Landsat-derived temporal profiles for corn-soybean feature extraction and classification.** G. D. Badhwar (NASA, Johnson Space Center, Houston, TX), J. G. Carnes, and W. W. Austin (Lockheed Engineering and Management Services Co., Inc., Houston, TX). *Remote Sensing of Environment,* vol. 12, Mar. 1982, p. 57-79. 15 refs.

A physical model is presented, which has been derived from multitemporal-multispectral data acquired by Landsat satellites to describe the behavior and new features that are crop specific. A feasibility study over 40 sites was performed to classify the segment pixels into those of corn, soybeans, and others using the new features and a linear classifier. Results agree well with other existing methods, and it is shown the multitemporal-multispectral scanner data can be transformed into two parameters that are closely related to the target of interest and thus can be used in classification. The approach is less time intensive than other techniques and requires labeling of only pure pixels. D.L.G.

A82-27393 † **Evaluation of the state of crops from satellite data (Otsenka sostoianiia sel'skokhoziaistvennykh kul'tur po sputnikovym dannym).** G. I. Borisoglebskii and V. V. Kozoderov (Gosudarstvennyi Nauchno-Issledovatel'skii Tsentr Izucheniia Prirodnykh Resursov, USSR). *Meteorologiia i Gidrologiia,* Mar. 1982, p. 94-101. In Russian.

The paper examines the possibility of evaluating the dynamics of crop development from remote sensing images. Results are presented on the determination of the structure of agricultural lands and the state of winter crops in the Kherson territory of the USSR from medium-resolution satellite images. B.J.

A82-27397 **Remote sensing of the structure of taiga landscapes (Distantsionnaia indikatsiia struktury taezhnykh landshaftov).** Edited by V. V. Kuzmichev. Novosibirsk, Izdatel'stvo Nauka, 1981. 248 p. In Russian.

Papers are presented on the use of remote sensing to obtain information on the relationships between forests and other elements of the natural environment: soils, relief, the mineralogical composition of rocks, subsurface water, and animal habitats. Particular attention is given to such topics as the mapping of the post-fire stages of the formation of forests, the remote sensing of the dynamics of cedar forests in Siberia, the use of anthropogenic features in landscape studies (with Lake Baikal taken as an example), the use of remote sensing to study bird populations, and the relationship between taiga landscapes and geological structures. B.J.

A82-27586 * # **Stochastic models of cover class dynamics.** T. H. Barringer (Hunter College, New York, NY; Pennsylvania, University, Philadelphia, PA) and V. B. Robinson (Hunter College, New York, NY). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 1. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 125-144. 84 refs. Grant No. NsG-5325.

Investigations related to satellite remote sensing of vegetation have been concerned with questions of signature identification and extension, cover inventory accuracy, and change detection and monitoring. Attention is given to models of ecological succession, present directions in successional modeling and analysis, nondynamic spatial models, issues in the analysis of spatial data, and aspects of spatial modeling. Issues in time-series analysis are considered along with dynamic spatial models, and problems of model specification and identification. G.R.

A82-27588 # **Data base requirements in support of crop models.** A. B. Park (General Electric Co., Lanham, MD). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 1. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 165-174.

Problems regarding the data base design can be approached in at least two ways. For the design of a 'local' model, both the crop and its environment are confined to the research location, and there is no need to consider the spatial distribution complexity problem. However, in the case of the design of a 'global' model, it is necessary to account for the variability of both the crop and the environment in all possible geographic locations. During the development and test of the model, it is normally attempted to simplify this problem by using the 'homologue' approach. Requirements regarding the input of agronomic data are considered, taking into account the crop area, the cropping pattern, the crop calendar, crop varieties, yield, water culture, fertilizer, plant pests, soil, the meteorological station, and the terrain model. Meteorological input data requirements are also discussed. G.R.

A82-27601 # **Multiresource inventory methods pilot test.** R. T. Pelletier (U.S. Department of Agriculture, Forest Service, Washington, DC). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 1. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 339-355. 6 refs.

The test is being conducted by the Forest Service as an advanced demonstration of Landsat technology to supplement current methods of conducting recurrent inventories over large areas. It will test, validate, and, if deemed successful by the Forest Service, transfer new remote sensing capability to the inventory and planning process; this will offer new efficiencies benefiting resource managers and planners. The pilot test will be administered over a three-year period and will support major efforts in two geographical areas. C.R.

A82-27617 # **Dew and vapor pressure as complicating factors in the interpretation of spectral radiance from crops.** P. J. Pinter, Jr. and R. D. Jackson (U.S. Water Conservation Laboratory, Phoenix, AZ). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 547-554. 8 refs.

Ground-based radiometers, utilizing relatively wide-band spectral filters similar to those of present and anticipated satellites, are being used extensively to develop fundamental relationships between agricultural targets and their spectral characteristics. In the present investigation some of the unique operational characteristics of a hand-held 4-band radiometer are utilized to examine the effect of dew on the spectral characteristics of wheat and to study the influence of atmospheric vapor pressure on the spectral quality of radiance measured over soil and alfalfa canopy targets. It is found possible to detect and quantify the presence of dew on crops by monitoring the depression in a spectrally-based vegetation index. The timing of spectral data acquisition is a critical factor, because complications regarding the interpretation of data can arise in connection with the presence of dew on crop canopies. G.R.

A82-27621 # **A timely and accurate potato acreage estimate from Landsat - Results of a demonstration.** R. A. Ryerson, R. J. Brown (Canada Centre for Remote Sensing, Ottawa, Canada), J.-L. Tambay, L. A. Murphy (Statistics Canada, Ottawa, Canada), and B. McLaughlin (Statistics Canada, Truro, Nova Scotia, Canada). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 587-597. 10 refs.

The current statistical data collection system for obtaining crop area estimates is considered. The area for which an estimate was required is located in the upper St. John Valley in New Brunswick, Canada. The 1980 ground sample and data collection is considered along with the analysis of remotely sensed data, taking into account procedures to improve estimates and the generation of the 1980 estimate based on Landsat data. A highly accurate potato area estimate for the three major potato producing counties of New Brunswick was obtained. G.R.

A82-27622 # **Landsat feature enhancement - Or, can we separate vegetation from soil.** J. E. Colwell (Michigan, Environmental Research Institute, Ann Arbor, MI). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 599-621. 12 refs.

Two separate procedures are presented for enhancing certain features in Landsat data. One procedure is designed to be helpful in assessing soil features in situations where the soil is partially covered by variable amounts of green vegetation. This procedure results in the calculation of a parameter called 'Projected Soil Brightness'. The other procedure is designed to be an aid in interpreting separate soil and vegetation effects in areas with partial cover of nongreen vegetation. This procedure results in the calculation of parameters called 'Normalized Vegetation Shadow Measure' and 'Corrected Soil Brightness Measure'. G.R.

A82-27624 # **Scene analysis for wildland fire-fuel characteristics in a Mediterranean climate.** M. J. Cosentino, C. E. Woodcock, and J. Franklin (California, University, Santa Barbara, CA). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 635-646. 9 refs.

During the dry summer and fall seasons, wildfires are a threat to homes, lives, property, and natural resources in California. A computer program called FIREMOD, which will be used to predict fire spread rate and intensity, is currently being developed. A description is presented of the findings of a research project undertaken to evaluate the potential of using remotely sensed and collateral data in a geographic information system framework to provide maps of chaparral vegetation characteristics for input as a fuels database in the FIREMOD computer model. It is found that Landsat spectral data can be combined with a synthesized texture channel in an unsupervised classification procedure to provide a physiognomic vegetation classification which includes density distinctions. These vegetation classes are useful for fire spread simulation models because they contain meaningful distinctions related to fire behavior. G.R.

A82-27643 # **A vegetation response model applied to range inventory and monitoring using Landsat MSS data.** F. R. Honey and I. J. Tapley (Commonwealth Scientific and Industrial Research Organization, Div. of Land Resources Management, Perth, Australia). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 823-837. 7 refs.

A model describing the response of vegetation to rainfall from the standpoint of corresponding changes in reflectance, as measured by the Landsat MSS system, is presented. The main assumptions of the model are (1) that there is an exponential increase of fresh plant cells from such sources of new growth as seeds or buds, and (2) that the growth rates of the new cells is larger than their decay rate, so that some maximum is reached before the rate of production from the diminishing number of sources is less than the rate of decay. Because the shape of the response function curve will be independent of the means of measuring vegetation density and condition, curves from ground-collected biomass data should match those derived from Landsat vegetation indices. Results from data collected in Western Australia for three vegetation communities and plotted according to the model indicate that data must be collected intensively at the time of the peak. O.C.

A82-27644 # **Forest change detection.** J. E. Colwell (Michigan Environmental Research Institute, Ann Arbor, MI) and F. P. Weber (U.S. Forest Service, Houston, TX). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 839-852.

The U.S. Forest Service has a requirement to make periodic assessments of the renewable resources of the United States. This investigation was designed to examine the utility of Landsat data for assessing changes in renewable resources. Change was analyzed for a partially forested scene in Kershaw County, South Carolina based on Landsat data separated by two years in time. A variety of change detection procedures were investigated, including image analysis and two kinds of digital (automated) procedures. The most fundamental conclusion of this study is that the type of change detection procedure implemented can significantly affect the estimates of amount of change. (Author)

A82-27645 * # **Soybean canopy reflectance as a function of view and illumination geometry.** K. J. Ranson, V. C. Vanderbilt, L. L. Biehl, B. F. Robinson, and M. E. Bauer (Purdue University, West Lafayette, IN). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 853-865. 16 refs. Contract No. NAS9-15466.

Reflectances were calculated from measurements at four wavelength bands through eight view azimuth and seven view zenith directions, for various solar zenith and azimuth angles over portions of three days, in an experimental characterization of a soybean field by means of its reflectances and physical and agronomic attributes. Results indicate that the distribution of reflectance from a soybean field is a function of the solar illumination and viewing geometry, wavelength, and row direction, as well as the state of canopy development. Shadows between rows were found to affect visible wavelength band reflectance to a greater extent than near-IR reflectance. A model describing reflectance variation as a function of projected solar and viewing angles is proposed, which approximates the visible wavelength band reflectance variations of a canopy with a well-defined row structure. O.C.

A82-27646 # **The influence of illumination and viewing geometry on the reflectance factor of agricultural targets.** K. Staenz (Zürich, Universität, Zurich, Switzerland), F. J. Ahern, and R. J. Brown (Canada Centre for Remote Sensing, Ottawa, Canada). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 867-882. 25 refs.

The influence of illumination and viewing geometry on the reflectance factor of agricultural targets is investigated. Bare soil, small grains, and broadleaf crops are examined, and the reflectance factor of all three ground cover types shows significant variations with viewing angle. The reflectance factor increases when viewing away from the sun, and decreases when viewing toward the sun, although the effect is not usually symmetric about nadir. Curves showing the typical variation of reflectance factor in the thematic mapper bands as a function of viewing angle about their nadir are presented, and in general, the reflectance is a quasi-linear function of view angle for soil, but shows significant curvature for crops. D.L.G.

A82-27647 # **Digital analysis of spatial and spectral features from airborne MSS of a forested region.** P. M. Teillet, D. G. Goodenough, B. Guindon (Canada Centre for Remote Sensing, Ottawa, Canada), J.-F. Meunier, and K. Dickinson (INTERA Environmental Consultants, Ltd., Ottawa, Canada). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 883-903. 7 refs.

Forthcoming satellite imaging sensors will have increased spectral resolution and different spectral bandpasses compared to the current Landsat MSS. In order to assess improvements in information extraction anticipated from the use of these sensors, eleven-channel aircraft MSS data were acquired over a rugged forest site, located at Gun Lake near Bralorne, British Columbia. The aircraft MSS data set was rectified to the UTM projection while taking topography into account by means of a digital elevation map. Spatial features were generated using a variety of texture measures. Feature selection and classification were performed to investigate how well forest types can be distinguished and damaged stands can be detected using spatial and/or spectral features. B.J.

A82-27656 # **The potential of remote sensing to monitor soil erosion on cropland.** P. R. Stephens and J. Cihlar (Canada Centre for Remote Sensing, Applications Div., Ottawa, Canada). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 985-995. 18 refs.

Multitemporal satellite-borne multispectral scanner and thematic mapper digital data are assessed, following an erosion survey, by relating changes in farm crop rotation to changes in erosion rates according to the Universal Soil Loss Equation (USLE). Of the Landsat 2 and simulated Landsat-D and SPOT-1 data studied, SPOT-1 was evaluated to be the most accurate, with 94% classification accuracy for the case of spring imagery. SPOT-1 and Landsat-D summer imagery achieved the high relationship values of 0.97 and 0.95, respectively, between near-IR reflectance/red reflectance and the USLE C factor. While forest and cropland mapping accuracies were on the order of 90-97% for satellite digital data, pasture mapping accuracies were as low as 59-79%. Visual interpretation of medium-scale aerial photography should therefore be more accurate than satellite MSS data in the classification of spring pastures. O.C.

A82-27662 * # **Evaluation of large area crop estimation techniques.** M. L. Amis, R. K. Lennington, M. V. Martin, W. G. McGuire, and S. S. Shen (Lockheed Engineering and Management Services Co., Inc., Houston, TX). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1047-1056. 9 refs. Contract No. NAS9-15800.

The performance of the USDAs EDITOR system is evaluated. The system processes Landsat imagery and estimates crop hectarage for large areas based on a regression estimator developed on a sample with known ground truth. It is found that use of multitemporal data over unitemporal significantly improves the hectarage estimates, and a 15% reduction in the r-squared of the regression occurs when independent and jackknifed test sets are used to evaluate the performance of the estimator. When an alternative clustering algorithm, CLASSY, is substituted for the current EDITOR method, estimator performance is improved with reduced need for analyst decisions. It is recommended that the CLASSY clustering algorithm and some form of jackknifing be implemented on EDITOR. D.L.G.

A82-27663 # **Potential utility of thematic mapper data in estimating crop areas.** R. Sigman and M. Craig (U.S. Department of Agriculture, Economics and Statistics Service, Washington, DC). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1057-1064. 5 refs.

This paper predicts potential improvements offered by thematic mapper data over multispectral scanner data when utilized in regression estimation of crop areas. A study comparing Landsat data and simulated thematic mapper data is described. Quantitative measures of potential improvements in crop-area estimates of corn, soybeans, and dense woodlands are calculated, and the sensor characteristics causing these improvements are determined. (Author)

A82-27664 # **Automatic and semi-automatic classification of Landsat agricultural crops.** J. D. Tubbs (Arkansas, University, Fayetteville, AR). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1065-1074. 10 refs.

One of the mathematical functions proposed by Crisp and Malila

(1980) for the modeling of crop spectral reflectance at different stages of physiological development is incorporated into an automatic classification procedure, or reference profile classifier, based upon the examination of unlabeled Landsat agricultural target development over an entire growing season and its matching with the closest reference profile. Although emphasis is put on incorporating a number of peculiar temporal profile aspects into a single decision rule, the concepts employed and difficulties encountered will arise in the development of any reference profile classification scheme. Attention is also given to the statistical problems affecting classification results, and a graphical procedure is adapted to the temporal-spectral classification problem in order to introduce an ancillary product useful in the definition of training inputs. O.C.

A82-27668 * # **Fanning - A classification algorithm for mixture landscapes applied to Landsat data of Maine forests.** S. G. Ungar (NASA, Goddard Institute for Space Studies, New York, NY) and E. Bryant (NASA, Goddard Institute for Space Studies, New York, NY; Dartmouth College, Hanover, NH). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1113-1120. 6 refs.

It is pointed out that typical landscapes include a relatively small number of 'pure' land cover types which combine in various proportions to form a myriad of mixture types. Most Landsat classifications algorithms used today require a separate user specification for each category, including mixture categories. Attention is given to a simpler approach, which would require the user to specify only the 'pure' types. Mixture pixels would be classified on the basis of the proportion of the area covered by each pure type within the pixel. The 'fanning' algorithm quantifies varying proportions of two 'pure' land cover types in selected mixture pixels. This algorithm was applied to 200,000 ha of forest land in Maine, taking into account a comparison with standard inventory information. Results compared well with a discrete categories classification of the same area. G.R.

A82-27673 # **Monitoring forest land cover alteration in Thailand with the analysis of ancillary and digital Landsat data.** K. Nualchawee (Asian Institute of Technology, Bangkok, Thailand), L. D. Miller (Texas A & M University, College Station, TX), C. H. Tom (Science Applications, Inc., Golden, CO), and S. Wacharakitti (Kasetsart University, Bangkok, Thailand). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1163-1172. 14 refs.

The present investigation was conducted to overlay ancillary map data onto a Landsat multispectral data base, create and test forest land cover change prediction models, determine forest land cover changes by means of image differencing procedures, and map forest land cover in a study site located in northern Thailand. The methods used in the investigation are discussed, taking into account aspects of map sampling and data plane compilation, a forest land cover projection, the determination of recent land cover dynamics, the Markov trend model of land cover, an initial spatial modeling test, and revised spatial models. G.R.

A82-27676 # **Crop area estimates using ground-gathered and Landsat data - A multitemporal approach.** J. W. Mergerson (U.S. Department of Agriculture, Statistical Research Div., Washington, DC). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1211-1218. 5 refs.

The paper describes a comparative study in which a unitemporal approach for obtaining crop area estimates using ground-gathered and Landsat data was compared to a multitemporal approach. Four channel data were used for the unitemporal approach. Eight channel data consisting of four channels from each of two dates were used for the multitemporal approach. The multitemporal data set and the two corresponding unitemporal data sets were analyzed using various procedures. Results indicate that the use of multitemporal data can significantly improve the precision of crop area estimates for corn, soybeans and winter wheat, obtained using the unitemporal approach. (Author)

A82-27678 # **A technique for automatic labeling of Landsat agricultural scene elements by analysis of temporal-spectral patterns.** E. Crist and W. Malila (Michigan, Environmental Research Institute, Ann Arbor, MI). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1227-1236. 11 refs.

A labeling technique is described which seeks to associate a sampling entity with a particular crop or crop group based on similarity of growing season and temporal-spectral patterns of development. Human analysts provide contextual information, after which labeling decisions are made automatically. Results of a test of the technique on a large, multi-year data set are reported. Grain labeling accuracies are similar to those achieved by human analysis techniques, while non-grain accuracies are lower. Recommendations for improvements and implications of the test results are discussed. (Author)

A82-27679 # **An invertible coniferous forest canopy reflectance model.** A. H. Strahler and L. Xiaowen (California, University, Santa Barbara, CA). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1237-1244. 14 refs.

A mathematical model of the reflectance of a discontinuous forest canopy allows the direct calculation of the height and spacing of trees from remotely sensed reflectance values. The model is essentially geometric in character, treating trees as randomly positioned green cones on a contrasting background, and is driven by estimates of the proportion of each pixel in green canopy, shadow, and understory. The model is invertible, so that parameters of tree height and spacing can be directly inferred from spectral reflectance ratios. A simple version of the model assumes that tree heights are lognormally distributed and that tree spacing is distributed as a Poisson function. A more advanced version assumes an empirically calibrated height distribution and Neyman Type A spacing, and also corrects for the topographic orientation of the pixel. A preliminary test estimates height and density within about ten percent, as compared to values determined by photointerpretation. (Author)

A82-27680 # **An experiment in probabilistic relaxation for terrain cover classification of Kuwait from Landsat imagery.** R. Harris (Durham, University, Durham, England). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1245-1252. 17 refs.

The stochastic probabilistic relaxation model developed by Rosenfeld et al. (1976) and others is described, and its relation to context classification discussed. Compatibility coefficients as correlation and as mutual information are given. An example of relaxation operations on a terrain cover classification of an area near Al Jahra, Kuwait is discussed, with poor results after the iterations to update the probabilities. (Author)

A82-27682 # **An autodigitizing procedure for ground-data labelling of Landsat pixels.** M. Ozga and R. Sigman (U.S. Department of Agriculture, Economics and Statistics Service, Washington, DC). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1265-1273.

This paper describes an automatic digitizing procedure for use in ground-data labelling of Landsat pixels. The described procedure is based on video scanning of line tracings from aerial photographs containing identified ground-truth areas. The key feature of this procedure is that in the data processing of the scan data, no line-following algorithms are used. Instead the procedure directly maps scan pixel labels into Landsat pixel labels. An evaluation of the procedure on test cases, plus economic comparisons with alternative manual digitization methods, are presented. (Author)

A82-27687 # **Digital processing of tropical forest habitat in Bangladesh and the development of a low cost processing facility at the National Zoo, Smithsonian Institution.** K. M. Green (Smithsonian Institution; Howard University, Washington, DC). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1315-1325. 12 refs.

A82-27691 # **Environmental studies by multispectral scanner under large-scale civil engineering construction.** S. Takeuchi (Remote Sensing Technology Center of Japan, Tokyo, Japan), A. Rikimaru (Pacific Aero Survey Co., Ltd., Tokyo, Japan), and T. Oshima (Hosei University, Tokyo, Japan). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1363-1373.

A large-scale tunnel construction project has produced significant environmental effects related to changes in the distribution of underground water. An investigation was conducted with the objective to study these environmental effects. As forest trees occupy more than 70% of the total area covered with vegetation at the test site, the investigation has been mainly based on a consideration of the vitality of the forest trees. The investigation makes use of an airborne multispectral scanning (MSS) procedure. Attention has been given to the development of appropriate data analysis tools, a basic experiment on the spectral characteristics of trees, aspects of MSS data correction and calibration, and an evaluation of the year-to-year change of tree vitality. G.R.

A82-27697 # **Landsat MSS applied to rangeland management in Western Canada.** R. J. Brown, K. P. B. Thomson, F. J. Ahern, K. Staenz, J. Cihlar (Canada Centre for Remote Sensing, Ottawa, Canada), S. G. Klumph (Alberta Energy and Natural Resources, Calgary, Canada), and C. M. Pearce (Calgary, University, Calgary, Alberta, Canada). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1435-1447. 23 refs. Research supported by the Alberta Environment.

Public lands in Alberta are administered by either the Alberta Forest Service or the Public Lands Division. Officers of these two administrative agencies regularly inspect the grazing lands to ensure that they are being properly managed. With the launch of Landsat-1 in 1972, came the expectation of developing techniques, which could be used to monitor, rapidly and inexpensively, the vast expanses of rangeland. In 1980, a project was initiated to determine the extent to which Landsat data could be used in an operational rangeland monitoring program. The project was divided into two segments, including a demonstration component and a research component. A description is presented of a part of the demonstration component, taking into account operational questions and a detailed analysis of Landsat imagery acquired for one of the test areas. G.R.

A82-27699 # **Development of a Canadian thermal infrared forest fire mapping operational program.** H. J. W. Shaw (Intertech Remote Sensing, Ltd., Calgary, Alberta, Canada). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1465-1473. 11 refs.

Real-time reconnaissance information of active forest fires and the accurate location of holdover fires during mop-up operations have been identified as major requirements for successful forest fire management. Intertech Remote Sensing Limited has developed an operational thermal infrared forest fire mapping program to meet these requirements in a reliable and effective manner. This program has included the acquisition and processing of thermal data over active and smoulder fires, the interpretation, analysis and plotting to scale of all such data and the delivery of a final thermal-map product to the fire base or centre in near real-time. (Author)

A82-27700 # **Seasat imagery for detection of coastal Wetlands.** J. G. Lyon (Ohio State University, Columbus, OH) and J. F. McCarthy (Vermont, University, Burlington, VT). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 3. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 1475-1485. 11 refs. Grant No. NOAA-04-M01-134.

The research examined use of satellite radar imagery for locating wetlands in Michigan and Oregon. The information supplying capabilities of Seasat were evaluated through field work, review of literature and comparison with other sources of data. Application of radar imagery for management of wetlands is addressed. (Author)

A82-28131 † **Application of space remote sensing data in forestry (Primenenie kosmicheskoi informatsii v interesakh lesnogo khoziaistva).** P. I. Moroz. *(Vsesoiuznaia Konferentsiia po Problemam Issledovaniia Prirodnykh Resursov Zemli i Mirovogo Okeana, Aviatsionno-Kosmicheskimi Sredstvami, Moscow, USSR, Nov. 1980.) Geodeziia i Aerofotos'emka,* no. 1, 1982, p. 26-30. In Russian.

A82-28153 **Influence of solar illumination angle on soybean canopy reflectance.** J. C. Kollenkark, V. C. Vanderbilt, C. S. T. Daughtry, and M. E. Bauer (Purdue University, West Lafayette, IN). *Applied Optics,* vol. 21, Apr. 1, 1982, p. 1179-1184. 17 refs.

Remotely sensed spectral measurements taken over croplands are influenced not only by the cover type and condition, cultural practices, and environmental factors, but also by the solar illumination angle in relation to the scene. The reflectance of soybean canopies of differing row directions were measured at 15-min intervals during three clear days with a Landsat band radiometer to determine the interaction of the solar illumination angle and row azimuth angle on the measured reflectance factor of soybean canopies. Diurnal reflectance changes of as much as 140%, which were related to the fraction of shadow, were observed in the red wavelength region. As soil cover approached 100% the diurnal changes diminished. A function that describes the solar illumination angle with respect to the row azimuth explained most of the diurnal variation in the measured reflectance. Variation in near-infrared reflectance was much less and did not appear to be as strongly related to sun-row angle interactions as the visible region. (Author)

THE APPLICATION OF REMOTE SENSING TO RESOURCE MANAGEMENT AND ENVIRONMENTAL QUALITY PROGRAMS IN KANSAS Annual Report, 1 Apr. 1980 - 31 Mar. 1981

B. G. Barr and E. A. Martinko, Principal Investigators Jul. 1981 164 p ERTS
(Grant NGL-17-004-024)
(E82-10029, NASA-CR-164756) Avail: NTIS HC A08/MF A01 CSCL 05A

Cooperative demonstration projects involved three principal areas of effort: agricultural and rural development; wildlife habitat and environmental quality; urban and regional planning. Several projects are reported including: an analysis of rangeland conditions in the Cimarron National Grasslands; an inventory of land use and land cover, particularly concerning forested lands, in two Indian reservations in northeast Kansas; an identification of homogeneous revenue regions in the state; an applied agricultural research and development project for Farmland Industries, Inc.; and an analysis of crop phenology and crop patterns in the high plains for identifying optimal dates of LANDSAT data for identifying irrigated lands. Several long-term projects include: weed pest surveys, irrigated lands data compilation from LANDSAT; and the development of an inventory of abandoned mined lands and potential hazard assessment in Kansas. DOCUMENTATION OF COMPUTER PROCEDURES FOR LABELING SPRING GRAINS AND DISCRIMINATING BETWEEN SPRING WHEAT AND BARLEY USING LANDSAT DATA

Robert Horvath, Principal Investigator, J. A. Finkler, and E. P. Crist Jul. 1981 81 p Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15476; Proj. AgRISTARS)
(E82-10030; NASA-CR-161081; SR-EI-04131;

ERIM-152400-5-T) Avail NTIS HC A05/MF A01 CSCL 02C

The computer software necessary to perform two research labeling procedures is described and documented The first labeling technique identifies spring small grain fields based on similarity of growing season and temporal spectral patterns of development in LANDSAT data The second technique further labels these fields as either wheat, barley or unknown spring grain, based on their spectral position in Tasseled Cap Greenness-Brightness space for a given day around the dough stage of wheat The subroutines which carry out the steps of the procedure are coded in PREFOR, a preprocessed FORTRAN The subroutines were designed to fit into the U.S Corn/Soybeam baseline procedure software developed for use in the AgRISTARS Program. Documentation of the subroutines are provided in an appendix.

THE SEVERITY OF THE BRAZILIAN FREEZE OF JULY 1981, AS MONITORED BY SATELLITE

Michael Allan Fortune Sep 1981 20 p refs
(INPE-2231-RPE/399) Avail: NTIS HC A02/MF A01

The location and intensity of freezing temperature during very cold nights ('geadas') in Brazil is discussed using satellite infrared television image data The data are needed to lay the groundwork for a short-term freeze forecast model, which is to be developed before winter 1982. A cold snap occurred on 20-22 July 1981, which destroyed a large part of the future coffee, sugar and other harvest is documented. The photographs of enhanced satellite images document the widespread occurrence of subfreezing temperature in the states of Parana, Sao Paulo, Mato Grosso do Sul, and Minas Gerais These sub-tropical areas are located north of the region which usually experiences frost, and thus damage to agriculture was particularly extensive. The synoptic factor responsible for the cold was a wandering cold-core cut-off low in the upper air, and not a strong cold front The data contained in the photographs, when combined with the meteorological observations also presented will be valuable in developing a prediction model for the occurrence of 'geadas'.

To honor numerous requests for information about data holdings, and to facilitate the requirements specifications process, a series of interim catalogs are being developed. The 1979 data acquisition year is covered in this volume with subsequent years to follow under different covers. This catalog lists by state those sample segment numbers for which aircraft data has been acquired and/or field inventory products produced.

RECOMMENDED DATA SETS, CORN SEGMENTS AND SPRING WHEAT SEGMENTS, FOR USE IN PROGRAM DEVELOPMENT

Willa W. Austin, Principal Investigator Apr. 1981 27 p Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15800; Proj. AgRISTARS)
(E82-10034; NASA-CR-161034; SR-L1-0409;
LEMSCO-15708; JSC-17137) Avail: NTIS HC A03/MF A01 CSCL 02C

The sets of Large Area Crop Inventory Experiment sites, crop year 1978, which are recommended for use in the development and evaluation of classification techniques based on LANDSAT spectral data are presented. For each site, the following exists: (1) accuracy assessment digitized ground truth; (2) a minimum of 5 percent of the scene ground truth identified as corn or spring wheat; and (3) at least four acquisitions of acceptable data quality during the growing season of the crop of interest The recommended data sets consist of 41 corn/soybean sites and 17 spring wheat sites

AGRISTARS: FOREIGN COMMODITY PRODUCTION FORECASTING. MINUTES OF THE ANNUAL FORMAL PROJECT MANAGER'S REVIEW, INCLUDING PRELIMINARY TECHNICAL REVIEW REPORTS OF FY80 EXPERIMENTS

24 Sep 1980 191 p Sponsored by NASA, USDA, Dept. of Commerce, Dept of the Interior, and Agency for International Development
(Proj. AgRISTARS)
(E82-10039; NASA-TM-84050; FC-J0-00502; JSC-16823) Avail NTIS HC A09/MF A01 CSCL 02C

The U.S./Canada wheat/barley exploratory experiment is discussed with emphasis on labeling, machine processing using P1A, and the crop calendar. Classification and the simulated aggregation test used in the U.S. corn/soybean exploratory experiment are also considered. Topics covered regarding the foreign commodity production forecasting project include: (1) the acquisition, handling, and processing of both U.S. and foreign agricultural data, as well as meteorological data. The accuracy assessment methodology, multicrop sampling and aggregation technology development, frame development, the yield project interface, and classification for area estimation are also examined.

USE OF THERMAL INERTIA DETERMINED BY HCMM TO PREDICT NOCTURNAL COLD PRONE AREAS IN FLORIDA Quarterly Report, 16 Mar. - 15 Jun. 1981

L. H. Allen, Jr., Principal Investigator, Ellen Chen, J. D. Martsolf, and P. H. Jones 15 Jun 1981 36 p refs Original contains color imagery. Original imagery may be purchased from NASA Goddard Space Flight Center, (Code 601), Greenbelt, Md 20771. Domestic users send orders to 'Attn: National Space Science Data Center', non-domestic users send orders to 'Attn: World

Data Center A for Rockets and Satellites'. HCMM
(Contract NAS5-26453)
(E82-10040; NASA-CR-164917; QR-1) Avail: NTIS HC A03/MF A01 CSCL 04B

The HCMM transparency scenes for the available winter of 1978-1979 were evaluated; scenes were identified on processed magnetic tapes; other remote sensing information was identified; and a soil heat flux model with variable-depth thermal profile was developed. The Image 100 system was used to compare HCMM and GOES transparent images of surface thermal patterns. Excellent correspondence of patterns was found, with HCMM giving the greater resolution. One image shows details of thermal patterns in Florida that are attributable to difference in near surface water contents. The wide range of surface temperatures attributable to surface thermal inertia that exist in the relatively flat Florida topography is demonstrated. A.R.H.

AGRISTARS: SOIL MOISTURE/EARLY WARNING AND CROP CONDITION ASSESSMENT. INTERFACE CONTROL DOCUMENT
Nov. 1980 13 p Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Proj. AgRISTARS)
(E82-10053; NASA-CR-161028; MU-JO-0101; JSC-16842) Avail: NTIS HC A02/MF A01 CSCL 02C

The interactions and support functions required between the early warning/crop condition assessment (EW/CCA) project and soil moisture (SM) project are defined. The EW Project aims to develop, test and evaluate techniques and procedures for adapting remote sensing technology to provide early warning of events and the timely assessment of those factors which affect the quality and quantity of production of economically important crops. Those techniques to augment and reinforce the current assessment activities are to be developed to improve the definition of the relationship between the plant(s) and its environment. This assessment and evaluation will certainly include the need for soil moisture measurement and estimation. The SM Project aims to develop, test, and evaluate techniques and procedures to measure or predict soil moisture in the root zone using both contact and remote sensors. A.R.H.

LEMSCO-14307; JSC-16366) Avail: NTIS HC A03/MF A01 CSCL 02C

Predictive procedures for developing soil hydrologic properties (i.e., relationships of soil water pressure and hydraulic conductivity to soil water content) are presented. Three models of the soil water pressure-water content relationship and one model of the hydraulic conductivity-water content relationship are discussed. Input requirements for the models are indicated, and computational procedures are outlined. Computed hydrologic properties for Keith silt loam, a soil typer near Colby, Kansas, on which the 1978 Agricultural Soil Moisture Experiment was conducted, are presented. A comparison of computed results with experimental data in the dry range shows that analytical models utilizing a few basic hydrophysical parameters can produce satisfactory data for large-scale applications. CSCL 02C

Several of the projects in the AgRISTARS program require crop phenology information, including classification, acreage and yield estimation, and detection of episodal events. This study evaluates several crop calendar estimation techniques for their potential use in the program. The techniques, although generic in approach, were developed and tested on spring wheat data collected in 1978. There are three basic approaches to crop stage estimation: historical averages for an area (normal crop calendars), agrometeorological modeling of known crop-weather relationships agrometeorological (agromet) crop calendars, and interpretation of spectral signatures (spectral crop calendars). In all, 10 combinations of planting and biostage estimation models were evaluated. Dates of stage occurrence are estimated with biases between -4 and +4 days while root mean square errors range from 10 to 15 days. Results are inconclusive as to the superiority of any of the models and further evaluation of the models with the 1979 data set is recommended. Author

ERIM-152400-7-T) Avail: NTIS HC A03/MF A01 CSCL 02C

Field notes describing a trip conducted in Brazil are presented. This trip was conducted for the purpose of evaluating a sample frame developed using LANDSAT full frame images by the USDA Economic and Statistics Service for the eventual purpose of cropland production estimation with LANDSAT by the Foreign Commodity Production Forecasting Project of the AgRISTARS program. Six areas were analyzed on the basis of land use, crop land in corn and soybean, field size and soil type. The analysis indicated generally successful use of LANDSAT images for purposes of remote large area land use stratification. Author

CSCL 02C

As the registration of LANDSAT full frames enters the realm of current technology, sampling methods should be examined which utilize other than the segment data used for LACIE. The effect of separating the functions of sampling for training and sampling for area estimation. The frame selected for analysis was acquired over north central Iowa on August 9, 1978. A stratification of he full-frame was defined. Training data came from segments within the frame. Two classification and estimation procedures were compared: statistics developed on one segment were used to classify that segment, and pooled statistics from the segments were used to classify a systematic sample of pixels. Comparisons to USDA/ESCS estimates illustrate that the full-frame sampling approach can provide accurate and precise area estimates. A.R.H.

EFFECTS OF NITROGEN NUTRITION ON THE GROWTH, YIELD AND REFLECTANCE CHARACTERISTICS OF CORN CANOPIES

M. E. Bauer, Principal Investigator, G. Walburg, and C. S. T. Daughtry May 1981 22 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15466; Proj. AgRISTARS)
(E82-10068; NASA-CR-165090; NAS 1.26:165090;
SR-P1-04044; LARS-030381) Avail: NTIS HC A02/MF A01
CSCL 02C

Spectral and agronomic measurements were collected from corn (Zea mays L.) canopies under four nitrogen treatment levels (0, 67, 134, and 202 kg/ha) on 11 dates during 1978 and 12 dates during 1979. Data were analyzed to determine the relationship between the spectral responses of canopies and their argonomic characteristics as well as the spectral separability of the four treatments. Red reflectance was increased, while the near infrared reflectance was decreased for canopies under nitrogen deprivation. Spectral differences between treatments were seen throughout each growing season. The near infrared/red reflectance ratio increased spectral treatment differences over those shown by single band reflectance measures. Of the spectral variables examined, the near infrared/red reflectance ratio most effectively separated the treatments. Differences in spectral response between treatments were attributed to varying soil cover, leaf area index, and leaf pigmentation values, all of which changed with N treatment. A.R.H.

DRYLAND PASTURE AND CROP CONDITIONS AS SEEN BY HCMM Final Report, Jan. 1978 - Jan. 1981

J. C. Harlan, Principal Investigator, W. D. Rosenthal, and B. J. Blanchard Apr. 1981 8 p refs Sponsored by NASA HCMM
(E82-10074; NASA-CR-165096; NAS 1.26:165096) Avail:
NTIS HC A02/MF A01 CSCL 08F

The antecedent precipitation index (API) was related to surface temperatures as measured from the NASA C-130 and HCMM thermal data. Significant results from the aircraft flight in May 1978, include: (1) canopy temperature were measured accurately remotely; (2) pasture surface temperatures were related to pasture and wheat soil moisture conditions; (3) no relationship was developed with that data set between wheat yield and thermal infrared data due to a lack of moisture stress during the measurement period; and (4) lake surface temperatures were useful in normalizing the thermal IR data. Results from HCMM also suggested a relationship between thermal IR data and antecedent precipitation index. While HCMM was adequate in detecting relative soil moisture differences, the overpass timing was infrequent and prevented detailed analysis of the API/thermal relationship. A.R.H.

Images at a scale of 1:250,000 were visually interpreted for identification and area estimates of sugar cane plantations in Sao Paulo. The basic criteria for crop identification were the spectral characteristics of channels 5 and 7 and their temporal variations observed from different LANDSAT passes. Using this technique, it was possible to map the sugar cane areas as well as the sugar cane already harvested. An area of 801,950 hectares was estimated within the study area. The confidence interval of correct classification ranged from 87.11% to 94.71%. T.M.

The state of Mato Grosso do Sul was selected as the study area to define the recognizable classes of Eucalyptus spp. and Pinus spp. by visual and automatic analyses. For visual analysis, a preliminary interpretation key and a legend of 6 groups were derived. Based on these six groups, three final classes were defined for analysis: (1) area prepared for reforestation; (2) area reforested with Eucalyptus spp.; and (3) area reforested with Pinus spp. For automatic interpretation the area along the highway from Ribas do Rio Pardo to Agua Clara was classified into the following classes: eucalytus, bare soil, plowed soil, pine and 'cerrado'. The results of visual analysis show that 67% of the reforested farms have relative differences in area estimate below 5%, 22%, between 5% and 10%, and 11% between 10% and 20%. The reforested eucalyptus area is 17 times greater than the area of reforested pine. Automatic classification of eucalyptus ranged from 73.03% to 92.30% in the training areas. Author

Measurements of wind speed, net irradiation, and of air, soil, and dew point temperatures in an orchard at the Rock

Springs Agricultural Research Center, as well as topographical and climatological data and a description of the major apple growing regions of Pennsylvania were supplied to the University of Florida for use in running the P-model, freeze prediction program. Results show that the P-model appears to have considerable applicability to conditions in Pennsylvania. Even though modifications may have to be made for use in the fruit growing regions, there are advantages for fruit growers with the model in its present form. A.R.H.

APPLICABILITY OF SATELLITE FREEZE FORECASTING AND COLD CLIMATE MAPPING TO THE OTHER PARTS OF THE UNITED STATES Final Report

In Florida Univ. Appl. of Satellite Frost Forecast Technol. to Other Parts of the U.S., Phase 2 Nov. 1981 59 p refs Original contains color illustrations (For primary document see N82-20607 11-43)
Avail: NTIS HC A12/MF A01 CSCL 04B

Tasks performed to determine the value of using GOES satellite thermal imagery to enhance fruit crop production in Michigan are described. An overview is presented of the system developed for image processing and thermal image and surface environmental data bases prepared to assess the physical models developed in Florida. These data bases were used to identify correlations between satellite apparent temperatures patterns and Earth surface factors. Significant freeze events in 1981 and the physical models used to provide a perspective on how Florida models can be applied in the context of the Michigan environment are discussed. A.R.H.

This program produces a file with a Universal-formatted header and data records in a nonstandard format. Trajectory coefficients are calculated from 5 to 8 acquisitions of radiance values in the training field corresponding to an agricultural product. These coefficients are then used to calculate a time of emergence and corresponding trajectory coefficients for each pixel in the test field. The time of emergence, two of the coefficients, and the sigma value for each pixel are written to the file. Author

SOYBEAN CANOPY REFLECTANCE AS INFLUENCED BY CULTURAL PRACTICES

M. E. Bauer, Principal Investigator, J. C. Kollenkark, and C. S. T. Daughtry Mar. 1981 46 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15466; Proj. AgRISTARS)
(E82-10105; NASA-CR-167456; NAS 1.26:167456;
SR-P1-04038; LARS-021781) Avail: NTIS HC A03/MF A01 CSCL 02C

Experiments were conducted at West Lafayette, Indiana in 1978 and 1979 to study the reflectance factor of soybean canopies as affected by differences in row width, population, planting date, cultivar and soil type. Reflectance factor data were acquired throughout the growing season with a LANDSAT-band radiometer. Agronomic data included plant height, leaf area index, development stage, total fresh and dry biomass, percent soil cover, and grain yield. The results indicate that row width, planting date, and cultivar influence the percent soil cover, leaf area index, and biomass present, which are in turn related to the multispectral reflectance. Additionally, the reflectance data were quite sensitive to the onset of senescence. Soil color and moisture were found to be important factors influencing the reflectance in single LANDSAT bands, but the near infrared/red reflectance ratio and the greeness transformation were less sensitive than the single bands to the soil background present. A GRADIENT MODEL OF VEGETATION AND CLIMATE UTILIZING NOAA SATELLITE IMAGERY. PHASE 1: TEXAS TRANSECT
David Greegor and Jim Norwine, Principal Investigators (Texas A & M Univ.) Aug. 1981 65 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Proj. AgRISTARS)
(E82-10107; NASA-CR-167454; NAS 1.26:167454; FC-J1-04176; JSC-17435) Avail: NTIS HC A04/MF A01 CSCL 02C

A climatological model/variable termed the sponge (a measure of moisture availability based on daily temperature maxima and minima, and precipitation) was tested for potential biogeograhic, ecological, and agro-climatological applications. Results, depicted in tabular and graphic form, suggest that, as generalized climatic index, sponge is particularly appropriate for large-area and global vegetation monitoring. The feasibility of utilizing NOAA/AVHRR data for vegetation classification was investigated and a vegetation gradient model that utilizes sponge and AVHRR data was initiated. Along an east-west Texas gradient, vegetation, sponge, and AVHRR pixel data (channels 1 and 2) were obtained for 12 locations. The normalized difference values for the AVHRR data when plotted against vegetation characteristics (biomass, net productivity, leaf area) and sponge values along the Texas gradient suggest that a multivariate gradient model incorporating AVHRR and sponge data may indeed be useful in global vegetation stratification and monitoring. A.R.H.

SAN JUAN NATIONAL FOREST LAND MANAGEMENT PLANNING SUPPORT SYSTEM (LMPSS) REQUIREMENTS DEFINITION Final Report
Lee F. Werth, Principal Investigator Sep. 1981 41 p Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15800; Proj. AgRISTARS)
(E82-10108; NASA-CR-167448; NAS 1.26:167448; RR-L1-04146; JSC-17422; LEMSCO-17163) Avail: NTIS HC A03/MF A01 CSCL 02F

The role of remote sensing data as it relates to a three-component land management planning system (geographic information, data base management, and planning model) can be understood only when user requirements are known. Personnel at the San Juan National Forest in southwestern Colorado were interviewed to determine data needs for managing and monitoring timber, rangelands, wildlife, fisheries, soils, water, geology and recreation facilities. While all the information required for land management planning cannot be obtained using remote sensing techniques, valuable information can be provided for the geographic information system. A wide range of sensors such as small and large format cameras, synthetic aperture radar, and LANDSAT data should be utilized. Because of the detail and accuracy required, high altitude color infrared photography should serve as the baseline data base and be supplemented and updated with data from the other sensors. A.R.H.

AN EVALUATION OF ISOCLS AND CLASSY CLUSTERING ALGORITHMS FOR FOREST CLASSIFICATION IN NORTHERN IDAHO
Lee F. Werth, Principal Investigator Sep. 1981 21 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15800; Proj. AgRISTARS)
(E82-10109; NASA-CR-167447; NAS 1.26:167447; RRI-L1-04143; JSC-17418; LEMSCO-17154) Avail: NTIS HC A02/MF A01 CSCL 02F

Both the iterative self-organizing clustering system (ISOCLS) and the CLASSY algorithms were applied to forest and nonforest classes for one 1:24,000 quadrangle map of northern Idaho and the classification and mapping accuracies were evaluated with 1:30,000 color infrared aerial photography. Confusion matrices for the two clustering algorithms were generated and studied to determine which is most applicable to forest and rangeland inventories in future projects. In an unsupervised mode, ISOCLS requires many trial-and-error runs to find the proper parameters to separate desired information classes. CLASSY tells more in a single run concerning the classes that can be separated, shows more promise for forest stratification than ISOCLS, and shows more promise for consistency. One major drawback to CLASSY is that important forest and range classes that are smaller than a minimum cluster size will be combined with other classes. The algorithm requires so much computer storage that only data sets as small as a quadrangle can be used at one time. A.R.H.

TRANSITION YEAR LABELING ERROR CHARACTERIZATION STUDY Final Report
N. James Clinton, Principal Investigators Oct. 1980 81 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15800; Proj. AgRISTARS)
(E82-10111; NASA-CR-160887; NAS 1.26:160887; RC-L0-00479; LEMSCO-14056) Avail: NTIS HC A05/MF A01 CSCL 05B

Labeling errors made in the large area crop inventory experiment transition year estimates by Earth Observation Division image analysts are identified and quantified. The analysis was made from a subset of blind sites in six U.S. Great Plains states (Oklahoma, Kansas, Montana, Minnesota, North and South Dakota). The image interpretation basically was well done, resulting in a total omission error rate of 24 percent and a comission error rate of 4 percent. The largest amount of error was caused by factors beyond the control of the analysts who were following the interpretation procedures. The odd signatures, the largest error cause group, occurred mostly in areas of moisture abnormality. Multicrop labeling was tabulated showing the distribution of labeling for all crops. Author

DEVELOPMENT OF ROTATION SAMPLE DESIGNS FOR THE ESTIMATION OF CROP ACREAGES

T. G. Lycthuan-Lee, Principal Investigator Sep. 1981 126 p refs Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15800; Proj. AgRISTARS)
(E82-10117; NASA-CR-167438; NAS 1.26:167438;
FC-LI-04153; JSC-17427; LEMSCO-15409) Avail: NTIS HC A07/MF A01 CSCL 02C

The idea behind the use of rotation sample designs is that the variation of the crop acreage of a particular sample unit from year to year is usually less than the variation of crop acreage between units within a particular year. The estimation theory is based on an additive mixed analysis of variance model with years as fixed effects, (a sub t), and sample units as a variable factor. The rotation patterns are decided upon according to: (1) the number of sample units in the design each year; (2) the number of units retained in the following years; and (3) the number of years to complete the rotation pattern. Different analytic formulae for the variance of (a sub t) and the variance comparisons in using a complete survey of the rotation patterns. A.R.H.

SONORA EXPLORATORY STUDY FOR THE DETECTION OF WHEAT-LEAF RUST

R. W. Payne, Principal Investigator Nov. 1980 43 p refs ERTS
(Contract NAS9-15800)
(E82-10133; NASA-CR-161051; JSC-16956;
NAS 1.26:161051; LEMSCO-15604) Avail: NTIS HC A03/MF A01 CSCL 02C

The applicability of LANDSAT remote sensing technology to the detection of a wheat-leaf-rust epidemic in Sonora, Mexico, during 1977 was investigated. LANDSAT data acquired during crop years 1975-76 and 1976-77 were clustered, classified, and analyzed in order to detect agricultural changes. Analysis of 1977 data indicates a significant proportion of the identified wheat is stressed (potentially rust-infected). Additional analyses show a significant increase in fallowing during the year, as well as a substantial decrease in reservoir levels in the Sonora agricultural region. Ground observations are required to substantiate these analyses. The possibility exists that heat-rust is not LANDSAT detectable and that the clusters identified as containing stressed signatures represent different varieties of wheat or perhaps nonwheat crops. A.R.H.

DELINEATION OF SOIL TEMPERATURE REGIMES FROM HCMM DATA Quarterly Report

Rick L. Day and Gary W. Petersen, Principal Investigators 31 Dec. 1981 3 p HCMM
(E82-10141; NASA-CR-168526; NAS 1.26:168526) Avail: NTIS HC A02/MF A01 CSCL 08M

Evaluation of LANDSAT and Heat Capacity Mapping Mission (HCMM) data as input into National Cooperative Soil Survey is discussed. Signature classification techniques were applied to 13 May 76 LANDSAT data. LANDSAT data was overlaid with HCMM data, revealing registration problems caused by a shortage of control points in LANDSAT data, and the WARP program developed to improve registration accuracy. Initial images for control point selection were produced using digital terrain elevation data. Statistical procedures for evaluating data classification and to describe spatial distribution of surface temperature and its correlation with soil surface conditions were investigated. J.D.
